There is no switching in connection with taking off the sleeper at Soo Jct; just got to stop, cut your car off over the switch and pull in; it is done by train crew. The dining car at Marquette is put in by switch engine. The change at Nestoria is made by the crew that runs from Nestoria to Calumet. There is no switching done at the Soo for No. 8. If we get into the Soo in time to turn the train and make connections, we turn it; if not, we go straight

to the depot, and it is turned by the switch engine; it would take them about 30 minutes to turn it and bring it back to Soo station.

1010 I have been on passenger runs, Marquette to Houghton and Calumet, and Marquette to Mackinaw.

No. 1, Marquette to Houghton, does no switching. No. 3, Marquette to Houghton, leaves with two coaches and a baggage and mail car, sets out the day coaches at Negaunee, and backs on to Northwestern train that they take out of Negaunee; then they set out a dining car at Summit.

No. 4, Houghton to Marquette, picks up the dining car at Summit, delivers the train, except the combination mail car, to the Northwestern, at Ishpeming, and couples on the two day coaches for Marquette that she brings up in the morning on No. 3; to set the diner in or out at Marquette, covering the full delay and getting the train under motion, takes about six minutes.

The cars turned over to the Northwestern on No. 4 include baggage, smoking car, chair, sleeping and dining cars, and at Ishpeming it takes an average of about 15 minutes; there is no switching on No. 2, and no switching at Marquette on No. 4. No. 4 goes back as No. 3; I have never noticed them turning it around; it goes out on the south track, and it is not necessary to turn it.

The passenger trains spoken about, running to Houghton, all go to Calumet, and lay up there; they are not at Houghton more than about 10 minutes, to transfer baggage, mail, etc., and discharge and load passengers, standing on the main track while there; no passenger train now lays up at Houghton. I do not know of any South Shore passenger trains that take sidings at Houghton, except possibly to pass other trains now.

Trains 43, Soo to Soo Jct., and 14, Soo Jct. to St. Ignace; on 43, no switching is done until you get to Soo Jct., when sleeping car off No. 8 is picked up, the train becoming 14. No switching is done between Soo Jct. and St. Ignace; at St. Ignace, no

1011 switching is done, except switch engine couples on to back end of train and shoves it onto the boat. It takes about 15 minutes to unload and get the baggage off at St. Ignace and to cut our engine off and shove the train out; that doesn't cover all the time to chain the train to the boat, at times; it depends on the weather; if weather conditions are bad, and sea heavy, it takes 25 to 30 minutes to chain the train down, because they take no chances.

Train 15 runs — St. Ignace to Soo Jct, and 44, Soo Jct. to Soo. The train is on practically one track on the boat; if there are no extra cars, the regular locomotive backs down, hooks on to it and pulls it to the depot. The only switching between St. Ignace and the Soo is laying out the sleeper at Soo Jct., to be taken by No. 7.

No switching is done at the Soo; you pull right down to the depot, cut your engine off, and that is all there is to be done; the train is taken to the wye and turned by the switch crew, and is ready to be taken out.

On No. 7, through to Marquette, the only switching is picking up the sleeper from No. 15 at Soo Jct. That is all of the switching

that is done by that train before it gets to Marquette; at Marquette, there is no switching, except to cut off the diner; sometimes this is done in lower yards; but it is generally cut off down at the passenger depot; you back in and leave the dining car right there; there is no switching done to it.

On No. 8, Marquette to Soo, there is no switching, except the exchange of sleeping cars at Soo Jct.

On No. 2, Marquette to Mackinaw, there is no switching done, except at Marquette; they gas the train, which is piped to the car, where it stands, in front of the station. It gets a Detroit sleeper at Soo Jct., and the switch engine puts it on the ferry in
1912 the same way we do No. 14.

No. 1, St. Ignace to Marquette, is on two tracks on the ferry. The road engine couples on to the train on one track; backs onto the balance of the train on the other. This train carries a sleeper, which is delivered to No. 18 at Soo Jct. Soo Jct. to Marquette, including getting out of Marquette going west, no switching is done, unless they have an extra car to set out.

No. 18 connects with No. 1, and runs from Soo Jct. to Soo; no switching is done, except it receives the sleeper at Soo Jct. It comes back as a mixed train, carrying baggage car and one coach to Soo Jct. As a mixed train, that has a combination baggage and smoking car and a first class coach, and an average of 12 to 15 freight cars; that runs without switching from Soo to Soo Jct.

On train 5, west and 6 east, Michigamme to Duluth, the only switching in Michigan is turning the train at Nestoria, done by the road engine, and consuming about 15 minutes.

I have been on the other local freight trains than 33 and 34; on some locals, considerably more than 50% of the time was consumed in switching, and on some less; it depends on weather conditions. I don't know as there are any much less than 50%; I fix that as an average for 33 and 34.

I have run on freight trains on all the divisions on South Shore; the business is heavier east of Marquette than west of Nestoria—quite a bit heavier. The freight business is lighter to Houghton than on the Western Division.

My last answers related to my experience on trains 33 and 34, and not to the general traffic of the Western Division, because I have not been running on it.

1013 Train 33 would leave Marquette at 7:30 A. M. No switching would be done there by the road crew, as the train is made up by switch engine, which puts the train in station order, the through cars and merchandise cars on the rear end, and cars for different stations in station order; that is all done at Marquette. The cars that make up that train were in different parts of the yard, and the switch engine assembles them and makes them into a train.

Q. About how long would it take to make up that train, assuming 17 cars?

Mr. Eldredge: If you don't know, say so; if you don't know, say so.

A. I have never worked in the yard, so I couldn't say how long it does take them to do it.

I have been around the yards; they get their cars in different parts of the yards. They have got a transfer up here that they get merchandise from; they have another place down in the yard where they get merchandise. Where they get their cars from different tracks, it would take one and one-half to two hours to get the train in shape. Some of those cars would be in the south yard, and some in the west yard; it is about a quarter of a mile from where they get those cars, at the passenger station, down to where they make up the train. Occasionally, they get a car out of the west yard, toward the shops. In arranging those cars in the train so as to get them in order, it takes the use of three or four tracks; those tracks are additional to those that the train has to use to go and get those cars and bring them to that point; they get them from different points and bring them in here and switch them.

Train 33, going west, would first stop at Eagle Mills to pick up cars for Houghton and Western Division, and local cars from
1014 Negaunee and Ishpeming; that would take you possibly 15 or 20 minutes to get them picked up in the condition you want them in the train; under normal conditions, you would get away from there in 20 minutes from the time you stopped. At Negaunee, you have to let a couple of passenger trains go by, if you get out of Eagle Mills ahead of them, which you would not do if you used 20 minutes to pick up those cars; if you consume 20 minutes at Eagle Mills, they would get by us there; we would have to get out of the way.

Assuming we met the passenger trains at Eagle Mills, we would go to Negaunee, set out cars there, if we had any, pull up and unload merchandise, take water, and pick up any cars to go west; that would take about 25 or 30 minutes.

At Ishpeming, the next station, we would pull in, set our cars for Ishpeming anywhere we can get rid of them for the switch engine; the engines work together there, the switch engine doing what she can.

We go through with those switching operations at nearly every station; some of the cars are full when we get them at Marquette; they come from different places; some are made up at Marquette—referring to merchandise cars. Some of them come from the east, from Mackinaw, across the Straits, some through the Soo, some from Marquette; of those we get at Ishpeming or Negaunee, some come from Chicago and south, and of those we get at Nestoria, some of them come from west of the state line.

WOOD.

Redirect examination.

By Mr. Eldredge:

In describing the switching of passenger trains, I referred to the normal or regular conditions, where the train ran without

1015 extra cars. On occasions, trains have to be switched more or less at important stations, for taking out of cars put in for a special service.

The tracks mentioned at Marquette, from which cars would be taken to make up a train (33), did not cover all the track from which cars might have to be switched for that train. The cars for the local freight come from different tracks; they might have cars from the D. S. & L. transferring, or from industrial tracks. I meant they got the freight cars from practically all the tracks at Marquette.

When I said I did not know all of the switching required or time required to make up my train, and get the cars into the train, that is true. I do not know, of my own knowledge, all of the switching required to assemble the cars in trains 33 and 34.

WOOD.

Recross-examination.

By Mr. Wykes:

I have talked with Mr. Eldredge in regard to my testimony in this case, Mr. Lytle, Mr. Houck and Mr. Tracy being present; other train conductors, Duroucher, Ryan, Wiseman and Hager, were present, and we talked over the conditions and things; we talked about the testimony we were going to give with Mr. Eldredge and Mr. Tracy, and nobody else.

Mr. Eldredge talked with me in the presence of these other trainmen, and talked with them in my presence.

1016 On January 27, 1914.

DIAS WISEMAN, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I am 37 years old, and reside in Marquette. I am, and have been, a freight conductor on South Shore nine years, and in service of South Shore 15 years. I have run extra and local freight, 33 and 34, for about a year, two years ago now; I now run 23, Soo Jct. to Marquette, and 24, Marquette to Soo Jct.; have been running these trains two years. Going east, the trip is made in 11 hours and 30 minutes, and west in 10 hours and 15 minutes; this is a local freight train. We report for duty 1.5 hours before leaving time at Soo Jct., and 30 minutes at Marquette.

At Soo Jct., we make up our train and do our switching, while at Marquette the switch engine does it. In my judgment, about 55% of the time consumed in my run is, on the average the year round, devoted to stational service or switching.

WISEMAN.

Cross-examination.

By Mr. Wykes:

My conclusion relates to trains 23 and 24. That switching and stational service involves loading, unloading, switching cars into and out of industries, and taking them over and giving them to connecting roads, both for carload and less than carload shipments.

Not a great deal of the freight we switch comes from other lines; some of the cars come from the Soo, some across the Straits, and some from Soo Line, at Trout Lake; some of the cars through the Soo are from across the river, but the biggest part are right from the Soo. In
the freight going from Marquette east, some comes up from
1017 Chicago, and some from west of the state line. On 24, I
should judge three-quarters of the freight would be carload lot stuff, and on 23 probably one-half.

Train 24 would have about 17 cars as far as Evelyn; then they double and handle 32 cars from Evelyn east; the hightest number of cars in that train would be 30 or 32. Out of Newberry, and those places. No. 23 generally has around 40 cars. The principal product out of Newberry is lumber and iron, that goes east, across the Straits. Out of Marquette, east, the freight is merchandise, flour, feed, lumber, etc.

When I stop at a station for switching, or to deliver or take on freight, I hand the station agent the bill, and see that the freight is unloaded; he checks off the bill, gives me way bills for freight he has to load, and I check it in the car; if I have carloads for him, I give him the bills, and if he has any for me, he gives me the bills.

The switching done by 23 and 24 may consist of setting cars for use at industries or at freight houses, and taking them away. We do not register, except at Soo Jct. and Marquette, and we don't need any train orders; we get them once in a while from the operator, who, in most cases, is the ticket agent. The operator is not the agent at Seney, Soo Jct. or Newberry, but the operator sells tickets at all of those places except Seney.

At Wetmore, I do business with the agent and operator, one being there at a time, and I do business with whichever one happens to be there; they both make out way bills and give me what train orders I have from that station. I would find them in the passenger station, and it is there I go to do the freight busines with them.

At Seney, the man who sells tickets does the freight busi-
1018 ness too, makes out the way bills, etc.; I find him in the com-
bined passenger and freight depot; I do business with him from trains 23 and 24 in the passenger station. At Newberry, I get orders from the operator, in the passenger station. He sells tickets most of the time; the agent has his office in the freight office there, and the operator in the passenger depot.

Up to two years ago, I was on trains 33 and 34; at Champion, I did business with the agent, who had charge of both the passenger and

freight depots; his office was in the freight depot. There were five employees there, the agent, two operators, cashier and freight house man. At Nestoria, the man I did business with was in the passenger depot, in 1912. The office at Champion is joint with C. M. & St. P., and these five employees represent both companies.

WISEMAN.

Redirect examination.

By Mr. Eldredge:

A merchandise car would also mean a car loaded full but consigned to different consignees, even though it was not to be delivered locally on my run, as well as a car with package freight.

WISEMAN.

Recross-examination.

By Mr. Wykes:

Wherever we find a passing track at a station, we use it, when necessary, to run our freight train in and get it out of the way so we can do our station switching. Passenger trains make no other use of those passing tracks than for purpose of passing some other train.

1019 On January 27, 1914.

JOHN HAGER, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live in Marquette. I have been freight conductor on South Shore for 12 years; previously in employ of other railroads. I have run practically all the South Shore freight trains; am now, and have for three years been, running time freights 53 and 54, Marquette to Thomaston, and return. A time freight handles practically all through cars, and occasionally perishable package freight; that is classed, for compensation, as a second-class local, but carded as a time freight.

Our running time west, on actual schedule, is 12 hours, and east 12 hours and 5 minutes. Excluding time for coaling, watering, and delay in meeting other trains, 30% or better of our time, on an average, is devoted to stational or switching service at stations.

1020 On January 27, 1914.

MARTIN RYAN, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live in Marquette. I have been a freight conductor on South Shore for seven years; I am now running time freights 21 and 22, between Marquette and St. Ignace, 151 miles. The schedule time on 22 is 12 hours and 15 minutes, and on 21 is 11 hours and 45 minutes. By time freight, I mean we handle no way freight, but through cars, principally.

We handle some loads and empties not destined to terminal points, picking up and dropping cars. Omitting time consumed in coaling, watering, and delays in meeting other trains, I figure an average of 25% of the time of these trains is devoted to stational work, including switching at terminals. About 1/3 of the freight carried in these trains would be local freight. I have, in recent years, run local freights 55-56, between Michigamme and Thomaston. Exclusive of time spent in watering, coaling, and delays in meeting other trains, in my judgment, 50% of the time of those trains is devoted to switching and other stational service.

RYAN.

Cross-examination.

By Mr. Wykes:

I was upon local freights 55 and 56 to about four and a half months ago. A local freight goes along, and does the station work, and handles package freight; such freight, east out of Marquette, would be cars to some station between here and St. Ignace, without regard to where they came from, originally, to get to Marquette. If it leaves Marquette, destined to some point east on South Shore, it is local, no matter where it originated. Trains 55 and 56 run between Michigamme and Thomaston, averaging 20 cars.

1021 For switching at the station, it may take 45 minutes to two hours; ordinarily, it will take over an hour at Soo Jct. It takes considerable time at Trout Lake, and at Newberry; it might be there 20 to 45 minutes. Still speaking of 21 and 22, we do no other switching between Newberry and Marquette; we may have a couple of cars to set out at Shingleton, taking 15 minutes; a few to take out at Wetmore, 20 minutes. Sometimes if we spend more than our time at a station, we cannot catch our time. We have a speed limit of 20 miles per hour, but sometimes we are delayed, and cannot make up time, on account of the weather.

To stop our train and take a siding, from the time the engineer applies his brakes, to be ready to stop, until we get into the clear,

will take between 15 and 20 minutes; you have to stop to get your switch open, and then start your train up again, and back in; I assume a train of 40 or 50 cars, which we sometimes have; it would take less time with a lighter train.

The average number of cars out of Marquette on 22 is about 20 cars; we pick up down at Evelyn, 45 miles east of Marquette, but do not do anything until we get there.

RYAN.

Recross-examination.

By Mr. Wykes:

On my last trip west, it took an hour to make Newberry, from Soo Jct.; that occurs frequently in cold, stormy weather. You can go right along with your train in summer, but a car standing on a siding in freezing weather is pretty well stiffened up, and it takes some time to get them warm; it takes more power to get it started—quite a while to get it under motion—when it is standing out, cold.

I don't know any place where the passenger trains stand out
1022 and get cold in that way.

The carrying capacity of trains varies with the different locomotives; our new engines have increased the carrying capacity of trains 60% over the standard engine—the 300 class. The tonnage figures I gave (R. p. 7431) applied to the new locomotives; before we got these new locomotives, the tonnage figures were 60% less.

I do not know the proportion- of freight in 21 and 22 that come into Michigan from other states, and that which originates in Michigan.

1023 On January 27, 1914.

JOSEPH DUROCHER, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live in Marquette. I have been a freight conductor on South Shore 14 years; am now running time freights 31 and 32, Marquette to Houghton, 94 miles. A time freight handles only through freight, except in case of perishable stuff. Time freights handle carload freight only.

Schedule, Marquette to Houghton, is 9 hours, 15 minutes, return 8 hours, 30 minutes. On 31 and 32, taking average for year, excluding watering, coaling, and delays in meeting trains, about 30% of the time is devoted to setting out and picking up cars; that does not include starting and stopping the train. I figure from a dead stop to a start. Depending on conditions of grade, we would begin to stop the train ½ mile from station, and on good track it takes

about ½ mile to get up to normal road speed; it would take 10 minutes to start and stop, assuming 20 mile speed.

DUROCHER.

Cross-examination.

By Mr. Wykes:

It would take 10 minutes to run a mile, reducing, in the mile, from 20 miles an hour to a dead stop and start, and then reaching a speed of 20 miles an hour again. My 30% applied only to trains 31 and 32; that train would coal once at Nestoria, taking 20 or 25 minutes, and take water four times on the road, consuming five minutes, or 12 if you stop purposely; at some places, water can be taken in three minutes. In saying five minutes to take water, I figured three minutes to take the water and two minutes to stop, or maybe seven minutes in coming to tank and stopping.

On 31, we are allowed one hour and five minutes for working Ishpeming, and meeting trains there; that time is allotted to
1024 do work there, and meet trains. On 32, 35 minutes is allowed at Ishpeming; also 25 minutes at Nestoria; those are the only places shown.

Train 32 is allowed, on schedule, eight hours and thirty minutes for 94 miles, at 20 miles per hour; four hours and 42 minutes allowed in running; that speed is sometimes exceeded. There is almost four hours to get rid of on the way; if you come in on stational service, twice the percentage would not run 30%; that runs up so high only when you lose time.

Some of the cars on 31 and 32 come from Wisconsin; seldom a car on that line from east of Soo.

1025 On January 28, 1914.

CHARLES E. LYTLE, a witness called by plaintiff.

Direct examination.

By Mr. Butler:

I live in Marquette. I am General Superintendent of the D. S. S. & A. and Mineral Range railways. I am in charge of operation with headquarters at Marquette, and my jurisdiction extends over entire road. I have been *been* with South Shore over 25 years; 1888 to 1893, Chief Train Dispatcher; 1894 to 1900, Superintendent, since then, General Superintendent. While Superintendent, my territorial jurisdiction was the same as now. During these 25 years, I have been familiar with the operation of the freight and passenger trains on South Shore.

The classes of regular freight trains are: Local freight, or way trains, through or time freights, and extras; the extras run as requirement dictates, and are not on time card as regular trains.

Local freights do all the way work—the station switching and the distributing and picking up of less than carload merchandise, package freight.

Time freights do the through business, as a rule, distribute, load and unload considerable perishable freight.

To a considerable extent, when necessary, when they are not loaded with through freight, the time freights drop out and pick up cars at points intermediate the termini of the run. They lose their number at the end of the division, except two Western Division time freights, that hold their numbers into Marquette, for identification. But the scheme of handling the freight, or connection of the time freight, is continuous—it goes right through, from one end to the other.

1026 No local freight runs over more than one division, except two Western Division locals, running down to Michigamme, seven miles, to get them to a town where we can care for the engine; they do not do much work in there.

On Mackinaw division, we have regular local trains, Nos. 23 and 24, Marquette to Soo Junction; also 49-26, Soo to St. Ignace, and 48-25, St. Ignace to Soo.

So far as pay of trainmen is concerned, local freights are the highest class of freight trains; the locals all get the same rate. The crew on local freight, Mackinaw Division, consists of conductor, flagman and two brakemen, and engineer and fireman.

Trainmen and enginemen are paid 10 hours minimum; 2,600 miles a month is guaranteed them; that is 26 working days a month. Ten hours or less constitutes a day's pay. The local freight conductor is guaranteed $117.50, or 4.5¢ a mile. They are paid in miles, if miles makes the highest amount, and paid in time, allowing 10 miles to the hour, if that makes the highest.

All local freight conductors and brakemen get the same rate of pay. Some of our time freights are modified locals; they get the middle class of pay, and the time freight men get the lower rate. The local freight employees get higher pay, because they have more work to do, and more responsibility, as they have more detail work to do in distributing, picking up and loading freight.

A local freight man is on his feet practically all the time, and a time freight man, a good many times, has an opportunity to sit in the caboose and watch the train. Regular time freights on Mackinaw Division are 21 and 22, St. Ignace to Marquette; also 47 and 46, Soo to Soo Jct.; also mixed train 42, Soo Jct. to Soo.

1027 The local freight spends the most time in work at stations; excluding time necessary for taking water and coal, receiving orders and meeting other trains, about 50% of the time of 23 and 24 and about 55% of the time of 49-26 and 48-25 (all local) is spent by the train and crew at station work. Time freights 21 and 22 spend about 25% of their time in switching, and 46 and 47 about 20%.

My means of knowledge on this subject is personal observation. I spend more than half the time, as a rule, on the road, and have since being Superintendent and General Superintendent. There

is no absolute record, to show the amount of stational work and running time between stations; the train sheets show the time only at telegraph stations.

Many times the train is late, or a night train, and the operator, who informs the dispatcher where the train is, is not there. The train sheet always shows the departing and arriving time at telegraph stations; the sheet would not show absolutely whether the delay was due to waiting for a train or to switching work; you would have to have a knowledge of the schedule, to figure that out.

I control the making of the time card; the running time has been changed from time to time, to suit the business on the different trains. We change the time cards every spring and fall. We make no radical change on freight trains, as a rule, unless new business turns up, or we lose business. The business is quite different in winter than in summer. In winter we handle a great many logs and forest products, and in summer we handle a lot of iron ore.

The forest products and logs are switched, taken up and set out by local trains, a great deal, and there are extra trains that handle logs and forest products. The ore over the dock is handled by extra ore trains. The time freights east of Marquette are filled out with all rail ore, and, as a rule, it is handled on extra. The time
1028 freights handle the highest class freight first, and, if there is not enough of it, they are filled out with lower class freight; e. g. ore; if this extra capacity of time freight is not sufficient to handle the ore east of Marquette, they run an extra.

Of the time of No. 42 (mixed train), 20% is spent in stational work. The crews report before leaving time, and are paid for the extra time. There is also a time allowance, and pay after reaching destination.

A good many of the trains run into time in excess of the card time, being late; of this, the local train has considerable more than the time freight on all divisions.

The following table shows the pay of trainmen:

Trainmen.	Local.	Time.	Extra.	Local, second class.
Conductor	$117.70	$107.80	$107.80	$112.20
Brakemen	82.50	71.50	71.50	77.00
Flagmen	82.50	.....	.....	.....
Engineer (per day)	4.90 to $5.55	4.65 to $5.30	4.65 to $5.30	.....
Fireman (" ")	3.10 to $3.50	2.85 to $3.25	.....	.....

1029 On Houghton Division, local freights 33 and 34 run from Marquette to Houghton; 50% of their time, I should judge, is spent in station work, outside of time necessary for fuel, water, passing, and taking orders.

Local freights 55, Michigamme to Thomaston, and 56, Thomaston to Michigamme, spend 50% of their time in stational work.

Time freight 53, a continuation of train 21, on Mackinaw Division, changing crews and engines at Marquette, and running Marquette to Thomaston, and time freight 54, Thomaston to Marquette, spend about 30% of their time in stational work.

Time freights 31 and 32, Marquette to Houghton, spend about 30% of their time in station work.

On Western Division, time freight 63, continuation of 53, with new crew and engine, runs from Thomaston to Superior, and the corresponding train in opposite direction, 64, spend about 50% of their time in stational work (60% for train 63).

Local freights 67 and 68, Thomaston to Iron River, Wis., spend, respectively, 75% and 60% of their time in Michigan in stational work.

The time cards do not specify all points where freight trains are required to stop and do work of switching, picking up, dropping out, or receiving or delivering freight. There are many places on the line where such work is required of freight trains, where there are no stations or telegraph offices; these stations are, in the aggregate, sources of a large proportion of the business.

1030 The out tonnage at such stations is always larger than the in tonnage, where they are shipping forest products, but even the inbound train has to take empties to these same places; it means stop and work, distributing empties; it is a source of delay in switching, though there may be no tonnage to go.

Train 65 is a continuation of the run of 67, Bessemer Jct. to Bessemer, 1.9 miles; they lose 30 minutes going up there; they don't take their whole train up, on account of the grade; they have what is to go to Bessemer on the head end, cut the train in two, haul merchandise car to Bessemer, unload the merchandise, load any merchandise that is to go, come back down the grade, couple up their train, and pump up the air again.

The extras are always time freight, carload freight, and run as the service requires; if we annul a regular local today and run an extra in its place, the extra gets the local pay.

The extra and time freight do the switching incident to the train and trip; the local way freights not only do that, but also do the stational switching—all switching necessary at all of the stations where switch engines and crews are not regularly kept. Omitting the extra ore trains, about 25% of the time of extra trains and crews is spent in stational work.

The ore trains handle the coal for all the mines from which they get ore, and some commercial coal for Negaunee, Ishpeming and points beyond. The tracks on which iron ore originates and moves to Marquette are used in handling fuel, supplies and materials for the mines; the coal goes in, in the season of open navigation; the mining timber, lagging, and supplies of that kind, for the mines, as a rule go in in winter. There is a lot of mining timber shipped, and the inmovement to the mines and districts about them is the year round.

1031 Our railroad connects with other railroads at different points, as follows:

Place.	Railroad.
Sault Ste. Marie	Algoma Central & Hudson Bay. Canadian Pacific. Soo Line.
St. Ignace	Grand Rapids & Indiana. Michigan Central.
Trout Lake	Soo Line.
Shingleton	Manistique & Lake Superior.
Munising Jct.	Munising Railway.
Marquette	Marquette & Southeastern. Lake Superior & Ishpeming.
Negaunee	Chicago & Northwestern. Lake Superior & Ishpeming.
Ishpeming Republic Michigamme	Chicago & Northwestern.
Republic Champion Sidnaw	Chicago, Milwaukee & St. Paul.
Houghton	Copper Range. Mineral Range.
Chassell	Houghton, Chassell & Southeastern.
Keweenaw Bay	Mineral Range.
Other Points	A few logging railroads.

1032 (Objection to testimony immediately following, that the records show the information.) About 5/6 of the tons of freight handled in Michigan by South Shore comes to it, or is delivered by it, at these interchange stations. I am familiar with the physical situation and work required at these points to interchange cars, and in general with the number of cars customarily interchanged at these points.

At Soo, the in-going train pulls into Soo, and sets the train out into the receiving yard; then the terminal switch engine spilts the train up, separates and delivers whatever is local, and another engine takes whatever is through across the river. Most of the interchange business at Soo goes or comes across the river; a little business is interchange between ourselves and the Soo Line. We have a lot of business local to the Soo. The volume of interchange at Soo runs from 40 to 100 cars a day, in; the out business from across the river, in loaded cars, runs 10 to 20 cars a day, plus all the empties that went over loaded.

At St. Ignace, the road train comes in, puts the train on a receiving track, about a mile from the dock. The switch engine splits up the train, separates the local cars, which are later distributed, and takes the interchange through cars to the slip dock and puts them on the

transfer boat to go to Mackinaw City. The object is to keep the boat going, and the local cars are distributed, when they have opportunity, between times. They take the in-bound car off the transfer boat, and nearly all the merchandise goes to the house to be separated, re-arranged, and consolidated by stations and destination, and through cars are made up near the freight house, into out-going trains, by the switch engines.

We have local business to and from St. Ignace, but the interchange business there is very much larger; the interchange there is
1033 running 1,000 to 1,200 cars a week, now. It is a little higher now than in summer; the interchange business is always heavier during the season of closed navigation; the business is now light for winter. The ins will not run so heavy on loaded cars—about 25% of the out-bound interchange loaded. We are getting large quantities of empties now. There are about 250 in-bound loaded interchange cars a week; the empties will run about the same.

That is for winter. In open navigation, the loaded out-bound interchange will run about 70 cars a day and in-bound about 35. A great many of the in-bound loads at St. Ignace are consolidated by us and made into less loads. We take the in-bound freights from the Michigan Central and G. R. & I., coming to us in separate and mixed cars, and consolidate them into a great many less cars than they give us. Each company may give us half a carload of freight for St. Paul, and we consolidate all that St. Paul freight into one car, at our expense, with the transfer force at St. Ignace, and make one car out of the two. We have a foreman and a lot of men there, doing that all the time.

Trout Lake is Soo Line interchange. This, at present, I think, runs 25 to 30 cars a day received; this is light for this time of year, but the average for the year is less than that; we give Soo Line at Trout Lake 15 to 20 full carloads a day, average the year round. Four wye tracks connect South Shore and Soo Line there; as a rule, they set their loads on the east wye, for our east bound trains to pick up; we deliver to them on the west wye, so they can get them. That is ordinary business; if there happens to be a congestion, as there has been, caused by ice in the Straits and the boats being tied up, it very soon plugs up. We had everything chock full there a year ago—500 loaded cars set out that we couldn't take in because we couldn't get our boats to working. We aim to keep the Straits open the year around.

1034 At Shingleton, the interchange is not so heavy; we have two tracks there, both owned by this company, and we set the cars where Manistique and Lake Superior engines can get them, and they set cars on our tracks where we can get them, and when our train comes along we pick them up; this interchange is daily, averaging three or four cars a day, except when they are receiving iron ore at Manistique furnace, when it sometimes runs 20 to 30 cars a day of iron ore.

At Munising Jct., there is a wye from Munising main track to ours, with sidings off it, and everything interchanged there by both companies is set on that siding and we help ourselves. Our east-bound

trains can interchange there readily, but the west-bound trains go way down onto the Munising track to get at the lower end of that siding, and pick up their cars and set out. The in-bound and out-bound loaded movement at Munising Jct. would not exceed 24 cars a week; we give them a lot of Detroit merchandise, going to Munising.

At Evelyn, we interchange with Munising Railway; there is just a wye track. Seven or eight cars of logs a day, going to Newberry, are interchanged to us the year around; the movement the other way is nothing but empties. Evelyn business is all billed, and we regard it as Shingleton business.

At Marquette, we deliver to L. S. & I. on Lake St., and receive from them in the east yard. The interchange averages five cars of loaded tonnage a day out and one car in. Every time they ship a car of lumber, though, they have to get the empty from us to load it on.

At Ishpeming, the interchange business is heavy. There is a transfer platform there with C. & N. W. track on one side and ours on the other; they set everything for us on their side, and our train picks it up. We deliver to them on the same track; if they don't
1035 happen to have a train come along to clear the track, the switch engine does it. At night, the road trains help themselves, make their own deliveries and pick ups on the transfers, and in daytime the switch engine does quite a lot of it. The volume of interchange at Ishpeming would run 20 cars a day each way.

At Republic, the volume of business interchanged is small, hardly a car a day, there is a wye track from our line to C. M. & St. P. At Champion, our track parallels the St. Paul; everything we have for them we set on their track, and everything they have for us they set on our track; I don't think the volume averages over 10 cars a day each way.

At Michigamme, I don't think the interchange averages one car a day, but within the last six months quite a lot of telegraph poles, off our Western Division, were delivered to C. & N. W. there.

At Houghton, the average daily interchange with Mineral Range would run 15 to 20 cars west, and lighter the other way; about all we get there is refined copper, which is heavier in winter than in summer.

The other business will run 20 cars a day, in normal condition, off our line, and five cars to our line. At Houghton, the road train pulls in, sets the train out, a switching engine breaks up and distributes the train, and (except train 31) takes across the river whatever goes to Mineral Range; train 31 sets out its own cars at Houghton and takes Mineral Range cars over the river. To bring back the cars for the local freight, we get them at Houghton; for time freight 32, they get most of the Mineral Range cars at Hancock, across Portage Lake. At Houghton, the transfer with Copper Range averages about five cars a day.

1036 At Sidnaw, we now transfer about 25 cars a day; we deliver a great many logs at Sidnaw to C. M. & St. P., going to Oconto, Wis. We get down there with a train of logs, two engines, double header, and set the train over into the St. Paul yard; we

have to go a mile to their wye track and turn around, and go back with the empties, which they set over into our yard.

We have a short transfer track there, used to deliver one or two cars. If you have 24 cars of logs, it won't hold it, so you have to run that train through, into their yard, turn all the switches, and set it out into their receiving yard; they do the same with the empties; there is no track long enough to hold that many. The present volume is lighter there than in previous winters, except last winter. In addition to logs, there is a little interchange there of pulp wood and forest products.

At Chassell, interchange would not average over one car a day; the H. C. & S. set the stuff on our siding, and we pick it up, and we have nothing to give them except the empties.

At Keweenaw Bay, the interchange, principally forest products, averages, in winter, 25 to 30 cars a day; there is very little in summer. There is a track on which we deliver to them, and a long siding where they set our cars for us.

(Witness corrects the station switching on train 67.) I gave it as 75%; I think it will run 100% of the running time, and that the train does fully as much switching as running in Michigan.

On 67, the train will make her run in 45 minutes, but she won't do her work in Michigan in less than an hour and a half. That would be 100% of the schedule time, because the schedule time only represents the time the train is due to leave; it does not
1037 represent the time the crew goes on duty.

On train 47, time freight, I meant 20% of the total time on duty was used for stational work; and the same as to all other runs.

For business originating on our line in Michigan, the consignor orders a car from the nearest agent; the agent orders the car from the Train Despatcher, by wire, or, if it happens the daily car report goes in, he puts it on that, or he may do both. The train despatcher sends a car, and notifies him what it is for; the shipper loads and bills it, and delivers the shipping bill to the agent, if it is an agency station. When the train comes along, they stop and switch it into their train. If it is an agency station, the agent bills it. If it is not an agency station, the conductor lifts the bill, left by the shipper, issues a conductor's bill, and leaves the shipping bill with the first agent in the direction in which he is going, and the agent makes a regular bill, which goes with the conductor, or follows him to the final destination. That bill is called the freight way bill, and a copy goes to the auditor. If it goes to an agency station, the freight is to be collected at destination, and, if to a non-agency station, the freight has to be prepaid, or, if it is a regular customer, and credit issued, to the next agent beyond where the freight goes, where the way bill is filed, and collected weekly.

The locals mostly set out the empty cars for loading at point of shipment. The time freights set out some, but, as a rule, they set them out in bunches, and the locals spot them as they come along. The time freights do very little or no placing for loading, unless it

is perishable freight. Most of the picking up is done by the local freights, or extra trains out for that purpose.

In Marquette, we keep two switch engines at work days and one nights, in winter, and, in summer, from three to six, days, and two, nights. These switch engines spot the cars for loading, and
1038 pick them up and assemble them into trains after they have been loaded at stations where we have switch engines; switch engines are regularly kept in service for such work at Sault Ste. Marie, St. Ignace, Marquette, Negaunee, Ishpeming and Houghton.

Q. Describe the stational service at the point on your own lines where shipments are delivered to the consignees?

A. Well, a shipment comes in for a consignee; in the first place, he has to be notified that it is on hand, and that is done either by postal card or usually by telephone, if it is in a town of any size where they have telephone service; and he gives the disposition of it, where he wants to unload and when, and the car then has to be placed for him to unload. Of course, the expense bill has to be made out and taken from the way bill and any corrections used, it may be totally wrong or some clerical error that has to be looked after and seeing that the right rating is used and the expense bill written and corrected, if necessary, and if the consignee has a weekly credit, why, he gets his freight and settles once a week, and if he don't, he has to settle for it before he takes his freight, and then his car has to be placed for him to unload, and he unloads with a team, as a rule, if it is a carload, and then after it is unloaded there is another movement, to pick up the car and dispose of it. If it is an agency station he usually asks the train despatcher for the disposition of it. In case the same agent did not want to load it out again, which is not frequent, but even if *it* did, that generally has to have a move to get it out to some other point, at the point of origin, to load and if it is not wanted to load out then the train despatcher tells him where to send it to get a load, or, if no loads are in sight, if it happens to be a foreign car, to send home.

Carload freight is not accurately checked; less than carload freight is always accurately checked. Of the total tonnage, in Michigan, of all kinds of freight, I think about 4% is less than carload.

1039 Q. How is the less carload stuff received on your line in Michigan?

A. If it is at a freight station, the shipper brings it to the station, and the agent issues a receipt for it and takes it; he takes it and issues a receipt and checks it, and the train comes along and he has it on the platform and when the local comes along the local crew loads it into a car. If it is at a large station, such as Marquette, St. Ignace or Sault Ste. Marie, the station forces load.

Q. Is the car spotted at the house?

A. Spotted at the house and loaded by station order, and when they came to it on the local train in the morning, the freight for the first station is supposed to be next to the door, and so on, until the car is empty. Then the same crew will probably keep loading into that car at points beyond, as they came along, at the stations. If it is at the station where there is no agent, and they are flagged for less than

carload shipment, there has to be a shipping bill with it just like a carload. They stop and load it, and sign the duplicate way bill.

Q. How is the delivery at destination to or for the consignee, on your line, handled?

A. If it is at a large station, the car comes in, in the train, and the switching engine switches it to the house. The house hands unload the freight into the warehouse, and make out an expense bill from the regular way bill. They notify the consignee by postal card, generally by telephone if it is in quite a sized town, the freight is there and for them to call and get it. He sends his wagon, and, if he has a credit account, why, he settles his freight once a week, and if he don't, he pays for it before he gets the freight, and he loads
1040 it then into his wagon.

Q. Is this manner of delivery followed without regard to whether such shipments originate on your line or elsewhere?

A. The delivery is followed the same way; it is just as much trouble to deliver a foreign shipment as it is one of our own.

Q. And the same so far as loading, for a foreign shipment, as it is if loaded for a local shipment on your line in Michigan?

A. Yes. Now, in regard to delivering less than carload freight to non-agency stations, the train stops at the station, and if the consignee is on hand, there, to get his freight, it is unloaded and checked out to him, and he signs the way bill, acknowledging the safe receipt of it, and if he is not there, unless he has filed authority with us to unload his freight at his risk, then that conductor has to carry that freight to the next station and put it in the care of the agent, and the next day we have to tote it back and try to find the man to get him to sign up for it. We never found it safe to deliver less than carload freight at non-agency stations, without receipting for it; it always results in a clash, if we do.

The amount of service per ton at interchange points averages 25% of the single full stational service, where the shipment originates or terminates on our line.

Shipments originating and delivered to consignees on our line in Michigan receive two full stational services; shipments originating on our line in Michigan and delivered to other carriers at Michigan junction points receive 1.25 full stational services; freight originating on our line in Michigan and carried into Wisconsin receives but one terminal service in Michigan; freight originating on our line in Wisconsin and delivered to consignees on our line in Michigan receives one terminal service in Michigan; freight originating on our
1041 line in Wisconsin and delivered to other carriers at Michigan junction points receives 25% of a full terminal service in Michigan; freight received from other carriers at Michigan junction points, to be delivered to consignees at Michigan stations, receives 1.25 full stational services; freight received from, and delivered to, other carriers at Michigan junction points receives 50% of a full terminal; freight received from other carriers at Michigan junction points and carried into Wisconsin receives 25% of a full stational service in Michigan; freight received from other carriers at Wisconsin junction

points and delivered to consignees on our line at Michigan stations receives one full terminal service in Michigan: freight received from other carriers at Wisconsin junction points and delivered to other carriers at Michigan junction points receives 25% of a full stational service in Michigan.

The stational service at point of origin comprises about the same number of moves as stational service at point of delivery. I never was able to get any figures on the cost; it would cost about the same.

On carload shipments, the cost of originating on our line is about the same as cost of delivering to consignee on our line; on L. C. L. shipments, the time of originating a shipment is a little more than the cost of delivery. On carload shipments from other companies, we ordinarily take the originating line's weights.

Trains 28, 29, 35, 36, 37 and 38 are not time freights; 40% of their time is spent in stational work.

1042 LYTLE.

Cross-examination.

By Mr. Wykes:

On a carload shipment originating on Fiborn Quarry branch, our locomotives on trains 28 and 29 would do all that quarry branch work. Time freights do not go into the quarry; that would be a local freight, though the scale of time is the same as a time or extra freight. In estimating the time spent in stational work on the quarry train, I consider the time running into the Fiborn Quarry from main line as stational work; the 40% spent in switching includes the time in going into Fiborn Quarry. I think mileage made on Fiborn tracks enters into our revenue train mileage, but do not know.

A carload of freight originating on Peninsular Bark & Lumber spur would be brought by the Soo switch engine. A car originating on Bay Mills branch would be taken out to main line by No. 49's engine; that is a local freight. After it was on main line, the same engine would take it along, if going west; if going east, they set it out for local 48, to take in.

A car originating on Fuller branch is taken out to main line, 1.5 miles, by engine of local, 49; if it was going west, this train would take it along; if going east, they would set it out at Strong's, and 48 would take it along. On See Why branch, engine would take it out and bring it to Hulberts, where they would set it out for east bound, if going east.

A car originating on asylum branch, Newberry, is taken out by engine of local 23; if it is going west, they take it with them; if it is going east, they set it out for 24. On the branches so far mentioned we get nothing but carload shipments.

A shipment originating on Northern Cooperage Co. branch is delivered to us at McMillan, by L. S. I. & C. Co. At Danber
1043 branch, the L. S. I. & C. Co. run their engine on our track nine miles, Danber to McMillan; they pay no compensation

for use of our tracks. A shipment originating on Danber branch is delivered to our main line by L. S. I. & C. Co. engine.

All the branches in Marquette are served by our switch engine. Where a shipment originates on Negaunee and Palmer branch, the Negaunee switch engine goes after it. The Negaunee old mine is obsolete, though the tracks are still there (.80 miles). The old Mary Charlotte mine has been obsolete for two years; the track is still there, but not actively in use. Teal Lake branch is open; it runs to Lillie, Hartford and Cambria mines; we deliver coal to gas company on coal trestle there. This branch is serviced with the switch engine from Negaunee.

We have an active track to Lake Superior Pit No. 7; they ship ore. The Lake shaft branch (Lake Superior) has been obsolete three or four years. The Cleveland Lake branch is an active shipper. The tracks to the mines around Ishpeming and Negaunee are served by our switch engine.

The Winthrop branch, three or four miles out, is served by switch engine. The American Mine is served by local freights, going in to deliver merchandise, and handling ore shipments, by extra crews. Most of their steam shovel spotting is done by Ishpeming switch engine.

For commercial work, the Champion mine branch is served by local freights; the mine is not shipping; neither is the Webster mine.

From the L'Anse merchandise dock track, we get heavy shipments of telegraph poles. Local train 34 would go after a shipment originating on merchandise dock track at L'Anse; if it was going west, they would set it out on the track at the station for local
1044 33 to pick up; as a rule, the local going east would take it along, but as this is at the foot of the 3% grade and many times they cannot haul it, the time freight might take it. If it was a shipment out of L'Anse for Marquette, or a point east, the local would bring it to Marquette; from Marquette to St. Ignace, assuming that as its destination, it would probably be carried in time freight 22; it becomes a through car on the Mackinaw Division, and we are anxious to make time with it. The same operation would occur with a shipment from the mill track at L'Anse.

If a shipment originated on one of these tracks at L'Anse, to go on to Western Division, the local would take it to Nestoria; then, if going west of Thomaston, the time freight would get it; if going east of Thomaston, the local would get it.

On Baraga mill track, the engine of local 34 does most of the work. On Paquette mill track, the locomotive of local 55 would take the shipment coming out of that track, if going west, to Thomaston; if going east, they would set it out at Covington, for the east-bound local to haul into Nestoria, saving the time freight a stop there. If it was going to Marquette, it would go from Nestoria on time freight 32 or 54.

Shipments from Trout Creek Manufacturing Co. track would be taken out, and taken to the end of the division, at Nestoria, or Thomaston, by the local (56); at those points, they would be set out for time freights.

On the Weidman spur, they have their own engine; we do not

run in there. We haul them many logs on local, and get the business after the logs are sawed into lumber; we have to switch the lumber cars into their yard and then go after them; this is a stone's throw from the track. Our local train switches them out and carries the cars to Thomaston on west, or Nestoria on east, when they go into time freights.

1045 The locomotive of 56 goes into Basco branch and gets logs for Trout Creek; our engines, of extra logging train, run into Baltimore branch, six miles, for logs; this extra runs between Ewen and Sidnaw. Just now, that engine switches at Jensen Mills; they haul 15 or 20 cars a day of logs from Jensen Branch to Ewen, for Jensen mills. The products from Jensen Mills come to our track at Ewen and are picked up by the locals, time freights, and extra; that is right at the foot of a hard pull, and the tonnage out of there is not heavy; it depends upon what train can pick it up best. The locals, as a rule, cut down there, to get ready to do work east; you have to keep throwing extras in there, to get out the accumulated tonage.

The Bergland branch is served by locomotives of local 56, which goes in 2.8 miles to the end of branch. If shipment is for Bergland mill, it spots it there; we have to take it back about one-eighth of a mile and run in on the mill branch. The lumber from Bergland Mill is taken out by local 56; assuming it goes east of Marquette, the time freight would get it at Nestoria.

At Thomaston, there is no switch engine, and the trains coming in set out their train, and, as a rule, it goes through on the same class of trains, west or east; if it is east-bound freight, it all has to be made up into new trains. Coming east, the tonnage out of Thomaston is much heavier than that into it; i. e., an ordinary freight engine will haul 550 tons into Thomaston from the west, but from the east they can haul 800 tons; so it means doubling up, and takes more power to get that tonnage into Thomaston from the west than from the east.

A train from Wisconsin east, through Thomaston, ordinarily would be made up and changed in composition there: that involves a lot of switching. The short cars are set out for the local, and if there are through cars, the time freight gets them, even if

1046 they only haul them to Ewen, 32 miles, at the foot of another hard pull. They always cut down at Ewen, if they come in with full loads; the tonnage into Ewen is 800, and out 550.

Nestoria is the end of a division, but all the Western Division engines come down to Michigamme, seven miles, to get to a town where the men can be cared for, and where there is an enginehouse. I do not know whether the mileage, Nestoria to Michigamme, so made, enters into our train mileage. If there is anything to go to Michigamme, they haul it.

At L'Anse, we keep one pusher locomotive. We do nothing with the other stalls in the enginehouse there; we don't use them for storage, as there is nothing to store.

Marquette is a division point, where every freight train is broken up and rearranged. Nearly every train from the west has some

cars to take out for Marquette. Every train is subject to inspection, and some cars must be switched out for repairs; eastbound, we haul more tonnage, as a rule, except the way trains from the west; westbound, they cannot haul the tonnage out that they can bring in from the east; a train must be cut into five or six trains, to get it out of here, going west, and a lot of tonnage originates here.

The east-bound trains are arranged here, and Soo and St. Ignace loads put by themselves; it is seldom unless you are running iron ore in large quantities for Algoma Steel Co. at Soo, Ontario, that you can send trains out of here for Soo; the majority of the train would be St. Ignace tonnage, and at Soo Jct. they set out the Soo tonnage.

A time freight into Marquette from the west would, under ordinary circumstances, have cars for Marquette, St. Ignace, Soo and intermediate points. If a car came into Marquette from the west on a time freight, and was destined for Newberry, it would
1047 be set out and sent on, on the local; it would depend a good bit on what the car was. It might be sent on an iron ore extra, if such a train were running. If it arrived from Marquette from the West on a time freight, and was destined for Seney, it would get there in much the same way, unless it was a car of meat or perishable freight, when it would go on time freight, or the first train; if it were not perishable, it would go on the local.

That would be the same as to practically all shipments intermediate Marquette and Soo Jct. As a rule, the short-distance-haul cars go on the local, unless there are more than it can handle and not enough cars to fill out the time freight. The fact that you had a short distance of haul out of Marquette would not mean that the entire haul on that car had been a short distance. Soo Jct. is a division point, and the runs of locals 23 and 24 end there. The time freight from St. Ignace, with a shipment for points intermediate Soo Jct. and Marquette, would set out the car where it was going, unless it was destined to Munising, in which case they would set it out at Wetmore, to be sent into Munising Jct. by the local.

On a local, Marquette to Soo Jct., arriving on time, the conductor's pay for the trip would be $5.43; the hours of run would be 11 hours and 55 minutes, and the distance 119 miles. On a time freight, Marquette to St. Ignace, 151 miles, arriving on time, the conductor's pay would be $6.47; on these two trips, the time freight conductor is paid 4.15 cents per mile, and the local conductor 4.52 cents per mile.

On local 55, Nestoria to Thomaston, 50% of the time in station service represents my judgment of the amount, based upon observation; I have ridden on the train a great many times, and noted the time consumed on the train sheet. I have computed the time required to run the mileage, and subtracted that for the total time allowed between terminals.

1048 In making up a time card, we make allowance for where the work is, from our best judgment; I have never seen one yet where too much time was allowed, but often there isn't time enough; that applies equally to time freights and locals. I have

made up time cards for time freights where the allowance for stational service was not enough, and I had to extend the time between terminals; that does not occur frequently. I don't change time frequently, but, when I do, I endeavor to arrive at the average running time, so as to get the train as near on time as possible. I make up the time sheets myself, and get at the amount of time allowed for a time freight to do switching by a general knowledge of where the work is. I think the work of a local is much more liable to vary, particularly in different seasons of the year; the work of locals is different in winter from what it is in summer, but the work of the time freight don't vary much.

From day to day, I don't think the work varies much on time freight, but there are exceptions, as trains get late from causes beyond our control. Sometimes, the trains have to kill time, but that will occur more frequently with the time than with the local freight.

I notice a difference in the time consumed in working in winter and in summer; we haven't made any change to take care of that condition, but notice it in the lateness of trains in winter. Frequently, trains are late in winter, but not so frequent in summer; this lateness is caused by weather conditions on time freight and intermediate work on local.

The principal winter commodities of the road are forest products, flour, feed and some grain; the flour moves from Superior and Duluth to St. Ignace and the Soo; forest products move everywhere, mostly to local saw mills, but large shipments of telegraph poles, posts and bark are shipped interstate off the road and to lower
1049 Michigan; the milled lumber goes wherever it can find a market, generally off the road, most of it east through the Soo, and a lot of it to Chicago; a lot of it comes east, across the state line, into Michigan. Some regular log trains—telegraph poles and posts—move the year round.

I don't think that, from the records of one of these local trains, it is possible to reach a close approximation on the amount of stational service and running time. I based my testimony in part on reports, and mostly by observation. Every local freight, even though coming in on time, has done a large amount of station switching, and, where it is done within the time allotted to the train, there would be no report of it; the report is simply of delay, giving the reasons, and does not necessarily give the time consumed in doing station work. In making up time schedules, we allow about 50% of the time for switching work on the locals.

The coal, Marquette to the mines, is handled in the extra trains—ore trains. We limit the down train in ore service to the average of up train of empties; the trouble, in coming down, is to hold them. In bringing an ore train down the hills, it is necessary to apply the air for all it is worth, and keep it on; that means considerable wear of track, car wheels and brakes; it is in excess of what it would be running on level track.

In saying 5/6 of the freight business was interchange, I meant carload business, and included that received from and delivered to other roads; that is in tons, and 1/3 would be local. The auditor

and I took that off the books. My comparison, between the amount of stational service on interchange business with the service in originating or delivering a shipment, referred entirely to carload freight. In L. C. L. freight, in addition to the service I mentioned, the station agent makes a way bill, listing every article shipped, takes a
1050 tissue copy, and sends it to the auditor, daily. Take, for example, a shipment of L. C. L. freight from Seney, the billing and expensing, collecting the money, taking the item into his account, and reporting, would be performed by the agent; the freight would be loaded and unloaded by the train crew.

If that were a charge account, it would be kept by the agent, and weekly settlement made. Of the shipping points in and around Marquette, the Dead River mill is the most remote from the freight station, being 3.5 miles; the next most remote is the branch prison, 2 miles; the next, Upper Peninsula Brewing Co., 1.75 miles; the next, Sinclair Stone Quarry, 1 mile; the next, the Gas Works, Sambrooks' Mill and stone quarry, each .5 miles. The service of taking cars to, and spotting them for, these industries, and bringing the cars into Marquette, is all done by switch engine.

At Ishpeming and Negaunee, eliminating ore service, we have one switching locomotive for each place. We have one, and sometimes two, switching locomotives in service at St. Ignace; frequently, train 28 assists, there.

Our passenger trains do not lay up at Houghton; they are through trains, and lay up at Calumet; these trains run through Houghton, the same as through any other passenger station.

On February 13, 1914.

LYTLE recalled.

Further direct examination.

By Mr. Eldredge:

I am in charge of D. S. S. & A. maintenance. I have endeavored in a general way to ascertain costs of maintenance of its industrial spurs and mine branches. In my judgment, the maintenance cost of industrial spurs will average $300 per mile per year, and the mine branches $375.

1051 LYTLE.

Recross-examination.

By Mr. Wykes:

The cost of $300 a mile, estimated by me, to maintain log spurs and industrial branches, was average for the system; the maximum might be $375, and the minimum $200. I think it would be lower than the cost of maintaining sidetracks adjacent to main line; I do not know the average for all sidetracks. I base my opinion on the number of these industrial spurs that are not active, without many

tie renewals, while the sidetracks must be kept tied up, to support the traffic.

I fixed the average for mining spurs at $375; I think the maximum would not exceed $500. The cost stated for maintenance of industrial branches would not include the maintenance of the main line switch; that has to be maintained for main line traffic. I don't know, and cannot estimate, the average cost of maintaining a main line switch. It would be a considerable item for all the switches on the line.

Complt.'s Ex. 74, Delf, apportioning stational costs. In testifying to the apportionment of stational costs, I did not take into account car balances, nor the question of interchange of foreign cars. I did not take into consideration the question of car accounting, the duties of the car accountant, the adjustment of balances through the auditor's office, the item of repairs to foreign cars on this line, the movement of empties back and forth, the work in adjusting and filing tariffs, the preparation of divisional sheets or the expense of outside agencies, advertising or traffic associations.

1052 LYTLE.

Redirect examination.

By Mr. Eldredge:

I do not remember having testified to Complt.'s Ex. 74, Delf, but, in saying that the service given to interchange was four to one, as against the service given at stations, I did not take into account those things, except that I did take account of the work of car interchange, but not the debits and credits in the car office on interchange cars.

Three Pacific type locomotives, numbers 550, 551 and 552, came on to road after the end of fiscal year 1913; they are in passenger service, between St. Ignace and Calumet. These locomotives are about six tons heavier than the 12 new type freight locomotives, 700 to 711 inclusive (1912).

I can see no difference in the relative weight of loading in intrastate and interstate freight cars. In my judgment, the greater proportion of short-haul local business is handled by way freight than by time freight.

LYTLE.

Recross-examination.

By Mr. Wykes:

I don't know as my duties go into the traffic department; I solicit, and get, a lot of freight. I have reports of a number of loaded cars to go, but no reports from which we could gain information of the average car loading; my statement with regard to average car loading is based on observation alone.

I think the greater number of cars in traffic are open cars. You gain your knowledge by observation, riding along, looking out of trains, to see how they are loaded—for closed cars. You cannot gain that knowledge, unless you actually look into them, and we only get that from a general inspection of the total train tonnage.

You cannot, by looking into a car, tell whether the freight
1053 in it is interstate or intrastate.

LYTLE.

Redirect examination.

By Mr. Eldredge:

The eight plus miles of south track, Eagle Mills to Winthrop Jct., is made safe for passenger use, and is occasionally used for detouring passenger trains, in the event of a blockade on the other lines.

LYTLE.

Recross-examination.

By Mr. Wykes:

It is customary for one railroad to use the line of another, in case of blockade, for purposes of detouring, and that is about the use this track has for passenger purposes.

1054 On February 11, 1914.

MORGAN W. JOPLING, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live in Marquette, and have charge of a real estate and land company—the Peter White Land Co. I have been renting property in Marquette for the last four years, and feel that I can form an accurate estimate of rental values.

I know the upstairs portion of the D. S. S. & A. passenger station in Marquette. In my opinion, the offices on the second floor of that station, would rent for $100 a month.

JOPLING.

Cross-examination.

By Mr. Wykes:

For office purposes, the lower part of the station, assuming it to be divided into the same rooms as the upper part, would rent for approximately the same.

I am one of the defendants in this case. Mr. Eldredge consulted me before he filed his bill, and I was made defendant on his initiative.

I recently purchased the land where the Colonial Building stands on Washington St.; that adjoins the Opera House on the east, and is the building Mr. Asire is in.

JOPLING.

Redirect examination.

By Mr. Eldredge:

I paid $9,000 for this property—49.5 feet frontage on Washington St. by 150 feet deep.

1055 On July 21, 1914.

JOPLING, recalled.

Direct examination.

By Mr. Eldredge:

I was present during Mr. Werner's examination; I know the southwest corner of Front and Washington Sts. Our estate owns property further down Front St., and I own property on Washington St., and other property throughout the city, and think I know the value of business property in Marquette. In my judgment, the value per front foot on Front St., southwest Washington St. corner, exclusive of buildings, is $350 per front foot.

JOPLING.

Recross-examination.

By Mr. Wykes:

That is the very best corner in town, and better than any of the other corners at that street intersection.

1056 On February 12, 1914.

EDWARD C. ANTHONY, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live in Negaunee, having lived there since 1864. I am 74 years of age, and came to Marquette County in 1856. Marquette then had 600 to 800 inhabitants, and Negaunee 200 or 300; the settlement at Ishpeming was the Lake Superior Mine, and a few log houses along the Marquette and Bay de Noquet road. That railroad was there in 1856, and subsequently part of M. H. & O.

I was a brakeman on the Marquette & Bay de Noquet two summers, 1859 to 1861; the road then extended 20 miles, but we did not operate the two or three miles west of Ishpeming. The road extended 20 miles west of Marquette; we understood at the time that they had to build 20 miles to get the land grant, and we had no use for the upper end. The Marquette, Houghton & Ontonagon constructed the road west from near Stoneville, and I am pretty sure it reached Michigamme by 1864.

ANTHONY.

Cross-examination.

By Mr. Wykes:

The Marquette & Bay de Noquet line goes straight out from Marquette, west; the Marquette and Western, or south line, was built many years later. When the road was extended west from Michigamme, the country was practically unsettled from there to Houghton, except a little settlement at L'Anse, perhaps at Chassell, and the Mission at Baraga; there were no farms or anything of that character along through the country. When the railroad went west from Nestoria, in 1887, it went through a practically wild country.

Going east from Munising was a wild country, to the Soo, when the D. M. & N. went through, and down to St. Ignace, there were
1057 no farms along the line, but there was a settlement at St. Ignace.

1058 On February 12, 1914.

EDWARD R. LEWIS, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I am, and have been, a civil engineer, for 24 years, being graduated from the Iowa State University. In 1906, I went to the Keweenaw Central as Assistant Chief Engineer, and spent a winter locating between Calumet and Keweenaw point, designing a few bridges and laying grades and track. In July, 1906, I went to Bay City, Mich., as Division Engineer, on maintenance, of Michigan Central, remaining there until I came to South Shore, July 1, 1912, as assistant to General Manager, doing engineering, principally.

I have given study to the apportionment of expenses of maintenance of way and structures between freight and passenger. In my judgment, the revenue train mile basis is proper for use in the apportionment of such expenses, so as to divide them with some degree of accuracy.

Answering with the list of items in maintenance of way and structures before me, that basis can justly be applied to all those expenses except one or two items. The reasons why revenue train mile basis will equitably divide these items of expense is that: You must dis-

tribute the expense to the cause which makes that expense in that proportion to which the cause applies. In my judgment, the revenue train mile basis does that; in each of the items mentioned, all or a portion of the expenses are caused directly by either passenger or freight service. I don't see how you can divide superintendence in any other way. It is occasioned by the one service or the other, in proportion to the train mileage.

A portion of ballast deteriorates on account of the elements, as do ties. The chief element of the roadway and track expense, which is largely a weather expense, is labor.

1059 Probably more of removal of sand, snow and ice is due to passenger than to freight train service.

Of bridges, trestles and culverts, a little more is due to passenger trains than to freight; the element of weather there is extensive; conservatively, 75% is due to weather.

The expense of snow and sand fences and snow sheds is caused a little more by passenger trains than by freight.

In buildings, fixtures and grounds, after the actual expense has been allocated to each service, there is still a little more due to the passenger service than the freight. The weight of the freight train is greater than that of the passenger train; that would not tend to a division on weight rather than on train mileage basis, as you have the speed versus the extra weight. The wear and tear on tracks—roadbed—is not due so much to weight as to impact. The weakest part of the track is the joint; the impact not only destroys the fastenings and joints, but breaks the rails. The excess in weight of the freight train causes slower freight train speed than passenger. It produces more wear on rail, especially on curves, because of the higher super-elevation necessary for the safety of the passenger train at its higher speed.

This super-elevation not only retards the freight train, but restricts its tonnage; this restriction is an appreciable amount, and makes it necessary to reduce the grade on the curve .03 to .05 of a foot, per hundred feet of curve, per degree of curvature. The wear and tear effect of super-elevation on curves, extends to the whole track structure; it tends to displace the ballast inside of the curve, it rolls the rail out, cuts the spikes and ties, and affects the freight equipment unfavorably, to an appreciable extent. It does not affect the

1060 passenger equipment, as the curve is elevated to suit the passenger speed.

There is a higher grade of maintenance on South Shore on account of passenger service than would be necessary for the freight service, in that you elevate your track for passenger trains; you must have a better track for passenger trains, for safety, than for freight, and that costs more money.

You have to get your track in shape for the long winter during the short summer, making the work more expensive, because it costs money to hurry. That is caused more by passenger than by freight, because you have to have it in better shape. During the winter, a large percentage of work is done on account of passenger service, to keep the road smooth, and more frequent patrol is necessary in cold

weather, to guard against broken rail; it is easier and less expensive to maintain a railway where there is no frost than in this country. The most of that extra expense you must charge to the passenger service; that is what increases the cost.

Bearing on removal of sand, snow and ice, and snow and sand fences and snow sheds, there is more necessity for protection of passenger trains against snow than for freight trains; therefore, a proportion of snow fences are in excess on account of passenger service.

We haul a large proportion of our material going into track and roadbed in revenue freights; I don't think of any material used in exclusive passenger business so hauled. The ballast of the eastern division is largely hauled in revenue trains; that is of considerable importance as an item of expense.

The train mileage basis should be applied to all tracks, including terminals; you could differentiate and split hairs for a hun-
1061 dred years, and you wouldn't get any closer to it than you would if you took all the tracks. If there be any error, I think that the train mileage basis, even taking all tracks, assigns less expense, if anything, to the passenger service than it should.

LEWIS.

Cross-examination.

By Mr. Wykes:

I have never previously testified to the propriety of the revenue train mile basis. My idea is that the division should be upon the factors which produced the wear or cost.

Q. Why, then, should you divide, upon the revenue train mile basis, trackage over which no revenue train miles are made?

A. Because you have a great many other items on the other side of your accounts. On South Shore, the passenger service is not one-half, and these tracks have been left in to offset that preponderence on the other side. I think there is hardly one of these exclusive freight tracks that a passenger train doesn't get on to once in a while, for purposes of passing, etc.; they get on to those tracks on every railroad. Because once in a year, or in two years, or random instances of that kind, a passenger train may on some occasion get on to one of these tracks is not the only cause for dividing their maintenance expense on revenue train mile basis; I said that was part of the cause.

I do not wish, in any sense, to go back upon the rule, first stated, that the cost should follow the thing which produces it. The chief reason for putting all tracks in is because there are other items on the other side of the account; e. g., excessive wear on track by freight trains, removal of sand, snow and ice, snow and sand fences and snow sheds, and roadway and track; I think that is all.

1062 Q. Now, why is expense of roadway and track an offsetting element upon this particular item of sidetracks and branches; just give us that, please?

A. Because there is more expense of that item due to freight train than passenger.

Mr. Eldredge: Did you answer that exactly as you intended?

A. Due to passenger than freight.

Q. In what way due to passenger; why?

A. Because of higher speed of the passenger trains, and the greater effect that they have on the track.

I wouldn't care to express that in a percentage off-hand; I should think it could be done. To do so, you would have to keep the account of the cost; I don't know that I would explain it further. I say you would have to find out how much it cost. You would have to go into each various item of expense of running each train and wear on the cars and track, going into the account in detail. I have not done that on this road, nor on any road, exhaustively. You could find out how long your ties and material lasted, and divide by the number of trains, on a train mileage basis. I intended to say that you would have to keep the accounts—the actual figures. This revenue train mileage basis would be an approximation. I have not been able to fix the limits of error or percentages within which that approximation would be certain or uncertain. I have not done that, and don't know anybody that has. This is the best basis I have thought of; no others were satisfactory.

I have thought of, and discarded, the ton mile basis; you might take the locomotive mile basis; I don't think any of them nearly so good as the train mile basis; it is merely my judgment. I have never gone into it with that certainty that would permit me to say how close that would come to actual analysis of the accounts
1063 if kept with the idea of making separation, except in a comparative way. It is my judgment that the accounts could be so kept that you could get pretty close to a correct separation between passenger and freight, by making the charges as the work is done.

I wish to change what I said as to keeping accounts to reach a close approximation; on reflection, I do not believe you can do it. It must be, to an appreciable extent, arbitrary.

Q. That being true, in your judgment, now, there is no real test of the correctness of the judgment of the man who furnishes the basis for doing that, other than the judgment of some other man to confirm it. I mean, it is a mattter that rests, and must rest, solely in judgment, this division between passenger and freight, and the proper basis therefor; it cannot rest in accounts, according to what you now say?

—. Not altogether; it can rest in accounts, as I told you, to some extent.

Q. You have never prepared any figures to indicate the justification of the revenue train mileage basis, have you?

A. No.

Q. And you do not know of any one else who has reduced that to figures?

A. No.

Q. The justification for it, then, rests in judgment, rather than in figures, does it not?

A. A certain percentage of it rests in judgment, certainly.

Q. What part of it does not rest in judgment. Or, what tests, in the way of figures, can we apply to determine whether the
1064 witness who says that it is proper is correct, or the witness who says that it is not — correct?

A. I would say every railroad is keeping accounts, and the judgment that you give must be based on those figures. You could not say that you could divide on a train mile basis.

Q. Now, what investigation have you made of the accounts of the South Shore, to test the correctness of your judgment on this particular question.

A. I have not made any.

Q. You have not made any?

A. None, except the figures I have seen and the accounts that they keep.

Q. Now, you say, first, that the speed of passenger trains produces a wear upon track in excess of the wear of a freight train going the same distance. Have you, or can you refer to, any figures which would indicate that to be a fact.

A. Why, yes.

Q. Give me the figures then?

The Master: I do not see what figures he could give.

Mr. Wykes: Well, he says there are figures.

A. Your labor and material costs you more if you have to keep your track up for passenger trains than they do for freight trains. Now, the figures are that it costs you more money.

Q. Is there any source that you can go to to pick out the parts of any figures that relate to the passenger cost or to the freight cost?

A. No, I do not know as there is.

Q. When you say that figures would represent that, you mean it is an expression of amounts based upon the judgment of the
1065 expert to the effect that the one costs more than the other; that is what you mean, is it not?

A. Yes.

Q. And you cannot refer to any figures that will indicate a certain cost for the freight train mile and a certain other cost for the passenger train mile, in the wear of track, or roadway and track?

A. No.

Q. And I think you stated yesterday you had not been able to express that in a percentage, even?

A. No.

Q. And you did not know of any one who has?

A. Not precisely of any one who has done it exactly.

Q. Do you know of any one who has attempted to, as fixing ranges of percentage?

A. We are all trying to arrive at a basis on this matter. It is, to a certain extent, arbitrary; I admit that.

Q. Do you know of any one who has fixed a range of percentages

that would be the high and low mark of the excess wear by a freight train mile from a passenger train mile?

A. No, sir.

The Master: Is there any possible way of figuring the percentage?

A. I would not like to say that it was not possible, absolutely, but it is not possible to date, I believe.

Q. Then, so far, it rests solely in judgment?

A. Yes.

Q. Unless we have new light, it will continue to do so?

A. Yes, I believe so.

1066 Q. Now, the element of greater cost attributable to passenger service due to elevation of curves, are there any figures that you have been able to determine that will indicate that extra cost?

A. I would have to answer that in the same way, to a certain extent, yes.

Q. Give us the figures, then, or percentages, either way?

A. I could cite instances where a reduction of super-elevation in a curve permitted the hauling of more freight by the same engine over that particular portion of track. Those matters are of record.

Q. But that goes outside of the range of the thing upon which you testify, because that does not go to the question of expense of maintenance of way and structures?

A. Possibly I misunderstood the question. You did not say whether it was maintenance cost, or whether it was not. You did not stipulate expense of maintenance.

Q. No, I did not stipulate expense of maintenance. But, as a matter of fact, your testimony referred to the division of maintenance cost on the revenue train mileage basis, and the revenue train mile does not comprehend any division of the limitations upon the amount of traffic that a particular structure would produce. Simply, you use the revenue train mileage basis for the division of expenses, and it was to that that I intended the question directed. If you will answer it in that light, it will satisfy me.

A. I think I have completed my answer.

The curves on a railway for freight traffic are elevated for a speed of 15 miles per hour; where we have freight and passenger trains on a single line, as a matter of safety, the curves have to be ele-

1067 vated much higher for passenger, which makes it more difficult for freight trains to get over the road.

The limitations imposed upon the freight track in the ratio of reductions of tons depends upon the degree of curvature. Five degree curves are considered sharp curves in this country, on main track. The percentage of difference in the amount you are able to haul, as between a curve elevated for 15 miles and one elevated for 40 miles an hour, with a radius of five degrees, is about 6%. The real limitations on South Shore traffic are the grades; curves produce the effect of grades.

I could not tell you the limitation produced by a 1% grade over a straight (level) track, there being no curve; nor can I tell you the limitations of a 2% or 2⅝% grade; it could be figured out. The

grades furnish the real limitations of loads on the South Shore. With curves eliminated, the grades would still cause limitations; the curves cause limitations over what now exists over grades on straight track. The grades on straight track now produce or cause limitations on the quantity of freight that can be hauled.

If you had a curve on a level track, you would not have the limiting conditions. I have known 40 miles an hour to be made around a 10 degree curve by a passenger train, but that is an extreme case. The safety would depend on the elevation. I do not know how many curves there are on the South Shore. I have made no classification to determine the number of curves of different degrees on the entire line; I could tell you on certain portions. On certain of the grades it is necessary to put on an extra locomotive, to get the freight trains over; e. g., at L'Anse and Ewen.

1068 While I have not calculated the average difference in power to the freight engine consequent upon the excess of super-elevation of curves, I should say that, on an average, that excess of super-elevation makes a difference in every ton hauled over the road of 2.5%, meaning you can haul that much less freight in weight. That percentage involves the mechanics of curve resistance.

One of the factors of the centrifugal force is weight; it would be less for 50 than for 100 tons. I could not tell you the average freight train or passenger train tonnage on South Shore; it is very much less for passenger. I have not estimated, and do not know, the percentage of South Shore trains carrying capacity loads. They are supposed to be loaded to their capacity; if we do not have the traffic, we would not send out the train. Through trains are loaded full, as nearly as possible. Way freights sometimes have to be sent out. The scheduled trains run according to schedule.

I think the grade, rather than the curve, or, rather, the grade in combination with the curve, is the limiting factor on all divisions.

You could haul more up L'Anse hill if you did not have the curves, especially those at the top. Assuming a curve elevated for 20 miles an hour, and a freight coming on to it at 35 miles an hour, it would slow down very suddenly, and cause the cars to incline to the inside of the curve very sharply, thereby raising the center of gravity, and tending to derail top-heavy cars. It might leave the track. If it did leave the track in such manner, it would be a considerable item of expense; it would be inadvisable, and verging on the unsafe, to operate at that speed.

In going down these hills, they keep the train under full control, whether passenger or freight, and the down speed is slower than on straight level track, for both; going up a grade like

1069 L'Anse hill, the speed is greatly diminished, in either character of trains. Calculated on the basis of loss of power, the curve reduces locomotive capacity 2.5%; that is the one thing I have been able to reduce to a percentage out of the greater cost. The others I haven't been able to express any percentage for, and don't know exactly what weight they would have.

Q. Did you figure, in percentage, the weight that should be given

to the freight side of this, due to the greater tractive power required of the freight locomotive? I am not speaking about curves, but I am speaking about the revenue train mileage basis, generally.

A. Well, only such as my knowledge and judgment dictated.

Q. Were you able to determine a percentage for that?

A. No, I think it would be very difficult.

Q. Were you able to determine a percentage due to the greater number of car wheels and wheel impacts in the freight service than in the passenger service?

A. No, I haven't reduced that to a percentage.

Q. Were you able to determine a percentage due to the greater load in the freight service than in the passenger service?

A. I did not do it.

The Master: Would you have to have the composition of each train, in order to do that?

A. Yes sir.

I took into account the extra time that would be consumed by the freight train in getting over the track, to the extent of knowing that the condition exists. I haven't reduced it to a percentage. Freight trains are delayed, largely, by keeping out of the way of pas-
1070 senger trains, which tends to make them slower. The percentage which should be added to the passenger side, for the latter element, I could only estimate; that rests in judgment.

I cannot tell you the consideration I gave to the fact that the freight train is longer in making its mileage than the passenger train in the part of the expense of maintenance of way and structures due to weather conditions; I thought of it, and considered it, and did not make any percentage because I didn't make any figures on the subject. The only other thing I can think of to produce extra cost on the freight side is the small matter of freight siding yard tracks.

The ice expense comes in at water stations, grade crossing, and where switching work is done. After a sleety storm, there is a good deal of work to clear the track of snow and ice, especially on the main track, where the switch engines do a very great deal of their running; it is much less elsewhere than on the main track in yards.

Removal of sand, snow and ice requires considerable work around switches; most of the hand work is done at switches and water stations—main track switches; sometimes the sidetracks kept open are cleared with snow plows, and sometimes not. The shovel work under this item cannot be separated from the snow plow work, nor the switches and sidetracks from main line. The freight traffic, other than iron ore, on South Shore, is heavier in winter than in summer; that requires keeping clear, during the winter, of tracks used in freight service. A large percentage of the freight tracks are used in winter; the traffic spurs are kept clear if they are used in winter; logging spurs, etc., are usually used in winter, when there is any operation at all.

I cannot give you the comparative life of a switch and a piece of straight track on South Shore; certain parts of the switch have
1071 less life than straight track, with the same amount of traffic—the frogs and switch points, for example; the frogs must be

taken out, repaired and put back; frequently, switch points can be repaired in the track.

It is my judgment that there is a considerable expense in maintenance of way and structure due to starting and stopping of trains; that being done with an air brake puts a much greater strain on the structure on which the engine and train stands; e. g., stopping a train on a bridge, or reducing the speed, with an air brake puts a terrific strain on the structure, causing impact. The starting of a long freight train causes an additional strain; the longer the train, the more slack there is, and the more impact in taking up that slack. The locomotive, itself, in starting without a load, or with one or two cars, is an item of considerable stress on the tracks; that would tend to displace ballast, and wear ties and rail; I shouldn't say the starting of a train would be a very great stress on ordinary track; continual starting and stopping at a particular place would cause a hardly appreciable effect; it has that tendency, but it would be small except in case of a bridge.

I have never investigated coal costs of starting and stopping trains; it would take more coal to get a train under way than to keep it moving, after it was under way. That 75% of the bridge maintenance cost is due to weather is conservative; the rest of the cost would be the wear on a bridge due to the movement of trains over it—the effect of the rolling load. An appreciable part of roadway and track cost is due to weather; a large part of the winter work is due to frost.

Q. When you get through with the revenue train mileage basis as a basis for apportionment of common expenses between passenger and freight, I think you have said it was an approximation, and it rests entirely in your judgment, I take it, without building it up on figures or percentages?

1072 A. It is not built up on percentages.

Q. It rests in your judgment of that being a proper basis?

A. I don't like to leave figures out altogether in this thing, because figures are the basis of it, after all.

Q. Your judgment acts on the figures?

A. Yes.

Q. And you haven't produced any figures, with the exception of those you gave for the curves?

A. That is all.

Q. And you haven't any to produce?

A. No.

Q. In what manner can that judgment be tested?

A. To a large extent, precedent. There is experience, in all of these things, from which we form our basis of opinion.

Q. But it can only be tested by opinion; it cannot be tested, to say that you are right, by percentages or figures; it must be tested by opinion and by judgment?

A. Yes.

Q. In what way can we determine whether you are right or whether the witness who says the revenue train mileage basis is not a proper method of division is correct?

A. Only by judgment.

LEWIS.

Redirect examination.

By Mr. Eldredge:

I heard Mr. Young's testimony, yesterday, regarding impact of trains in striking bridges. I know, and it is a well known
1073 fact, that impact is a larger consideration in the deterioration of a bridge than weight. When a load rolls, there must be impact. I do, and I do not, agree with Mr. Young as to the effect of the first impact. He said the greatest impact on the bridge was the first blow; that is the case, but it is due to the effect of striking the end of the structure, more than to the fact that there is greater impact; you are striking the end of the structure, from solid track, instead of striking it in the middle. You are coming off of a comparatively immovable structure on to one in which there is some give; if you didn't have that element, the impact would be the same. The effect of the impact in striking the end of the bridge is the greater.

LEWIS.

Recross-examination.

By Mr. Wykes:

I have not determined the amount of impact that would result from a train weighing, say, 40 tons, going at a speed of, say, 30 miles an hour, as against one weighing 80 tons, going 20 miles an hour; I am simply stating theory; I think I have determined that a good many times. I know what effect the increased load produces on the impact, but this element enters in. We restrict the weight to the safe load, allowing for impact; the amount of load must be taken into account in the amount of impact. You would take the weight of the engine; the train is not on the bridge.

1074 On February 18, 1914.

ROBERT B. RIFENBERICK, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I am, and have been since 1896, a civil engineer; I am now Consulting Engineer of the Detroit United Railway.

I was employed on D. S. S. & A. during construction, Nestoria to Iron River, Wisconsin, in 1887. When I went there, the cuts and fills were completed, the rails were down, and some, but not the full quota of, ties were. The land was heavily timbered—virgin forest at that time.

I remember no town from Nestoria west, except Dogwood, now

Saxon. The railroad crossed the military road at Bruce's Crossing. My work was putting in alignment and grade stakes for ballast; we had to widen out practically all the embankments to standard widths, and clean out the cuts, before we could ballast. This was by reason of the sinking and sloughing off of the roadbed. We sometimes raised embankments two or three, and in some instances four, feet; we had several sink holes where we put carload after carload of material; they would stay up for a while, and then we would go back and put on more.

That, originally, was considerable; I have no accurate memoranda or data of the number of yards; I think it would run into hundreds of thousands of yards. The grading had been done by contract, and was completed and accepted as being up to grade and specifications; at least, no question on that subject arose after I was on the ground. I remember no embankment that did not require some widening and dressing up; the larger embankments require the most. I think I was engaged on that work all that summer, and we had construction trains continuously.

1075 RIFENBERICK.

Cross-examination.

By Mr. Wykes:

When I went on to the road, it was completed, as far as the original grading was concerned, and the contract work was done; it was completed to subgrade, and the ballasting would necessarily come after ties and rails were laid.

The going wage for common labor in 1887 was exceptionally high up there; we had to pay $2 a day for poor labor.

1076 On March 24, 1914.

SUMNER G. HORTON, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live at Flint, Mich., and am 49 years old. I am employed by State Tax Commission, as foreman; have been with them 12 years, except three years. The last four years, I have acted as examiner and special assessor, giving my whole time to valuation of property. I have present charge of valuation work in Grand Rapids; the purpose is to place that city on a cash value basis. Previously, I had charge of valuation in Van Buren County, and previous to that in Marquette County with Mr. Twiss. We spent about eight months in the latter county with a force of five to seven men; Twiss was there during the time we were at Marquette city, possibly two months. We went there Feb. 22, 1913, and had made some preparatory work be-

fore that. The values we reached there were used for purposes of assessment in 1913.

On Complt.'s Ex. 1*b*, Riggs, description 2, figure 2, in Marquette County, right of way, from Chocolay depot, mile post 150.56, to mile post 151.92, 1.46 miles. At East Lakewood, the lots are 100 feet wide, and vary from 440 feet to 1,100 feet in length; about 12 are above 800 feet, eight are above 600 feet, and the seven remaining lots run from 440 to 476 feet in length. In Riverside Add., Lakewood, all lots are 100 feet wide, and vary from 400 to 700 feet in length; about 12 lots are above 500 feet long, about 10 lots 400 to 500 feet long, out of a total of 51 lots; plat lies parallel to south line of South Shore, south and west of railroad, on each side of Chocolay River, and lots in most cases run to river.

In East Lakewood, lots 2 and 3 sold for $175, lot 7 sold for $95, and lot 8 for $100. In Riverside Add., lot 21 sold for $75,
1077 lot 22 for $120, and lot 24 for $100; these considerations are verified by myself, either through owner or Mr. Asire, who sold them. The north end of these lots runs to railroad; houses are built facing both ways.

In the plat of Lakewood, lot 1 sold twice for $100, lot 2 for $120, lot 3 for $120, lot 4 for $100, lot 5 for $100, lot 12 for $125, and lots 16, 19, 21, and 26 for $100 each. On description 3, mile post 151.92, at the city limits, to mile post 153.5, where the main line enters Lake St., I valued the land at $100 per acre; we placed it there for purposes of assessment. On description 6, Marquette County, 170 feet on west side of Lake St., immediately south of Hampton St., I valued the lots at $200 per lot. I based that value on value placed on adjoining lots, by our examiners. We made very little change in the values placed by the committee in Marquette on these lots.

Description 7, 47 lots between Hampton and Mesnard Sts., I valued at $200 per lot; on description 8, $100 per lot. We had no sales of vacant lots; we estimated what buildings were worth, and deducted that value from the total value; we had sales of lots with buildings.

In description 9, right of way from east line of Adams St. to city limits, on south line, mile post 272.75, 26.60 acres, I valued land at $100 per acre, to Catholic cemetery, and $25 from Catholic cemetery to city limits. On description 10, right of way to Marquette quarry, I valued at $80 per lot; lots are 50 by 134 feet; we paced them off to get the size, and had reference to sizes of adjacent lots.

I do not recollect any sales of lots in this neighborhood; we had some sales of lots with buildings on, and by deducting the value of the building we could tell what the lots were worth.

1078 In description 11, lots fronting on west side of Lake St., between Jackson and Mesnard Sts., I valued the eight lots at $400 per lot; lots are 66 feet front and 134 feet deep.

In description 12, 12½ lots, 66 feet wide, between Jackson and Mesnard Sts., I valued lots 41, 42, 43 and 44 at $250 each; lot 1 and east half of lots 31 and 32 at $250 each; lots 69, 70, 71, 72, 73 and 74 at $200 each.

In description 13, land fronting on west side of Lake St. from Jackson St. to north line of Ely lot, 1,000 feet, I placed a value on the

first eight lots, 66 feet each, starting from south, at $500 each; the second 8 lots at $600 each, and 4 lots at $250 each; total, $9,800 for parcel. Those would be in rear of Champion St. lots.

In description 15, 184 feet frontage on Front St., south of Baraga, I valued land at $90 per front foot on Front St.

Description 16, tract of land fronting on west side of Lake St., extending from north line of Ely lot to Baraga Ave., 1,110 feet, I valued at $15.00 per front foot, measured on the street.

In description 17, right of way fronting on Baraga Ave., parts of lots 3, 4 and 5, block 3, C. M. & I. Co. Add., and a small triangle adjoining lot 3, I valued land at $30 per front foot; I had no sales in direct vicinity.

In description 18, right of way fronting on Spring St., also triangle on corner of Third and Spring Sts., I valued land at $20 per front foot on Spring St., including triangle.

On description 24, 69.7 feet frontage on Front St., being ap-
1079 proach to ore dock 4 on both sides of street, and approach to dock 5 on east side of street, I valued land at $150 per foot on east and west side of Front St., north of Main, and $125 per foot on easteast side of Front St., south of Main.

On description 26, frontage on east side of Front St., 30 feet, $125 per foot on Front St.; in description- 27 and 28, the site of the passenger station, I valued the portion facing Front St., 183½ feet (153½ feet up to right of way of the Jackson cut) at $150 per foot, and for the remainder of the description, back of the Front St. lots, I took the same number of feet facing Third St., at $40 per foot. Lots are 124 feet deep on both streets; that leaves a parcel 326 feet by 183½ feet deep at $45 per front foot on Main; total, $49,760 (for the two parcels, just the land).

On description 29, which is 14,608 square feet back of the buildings fronting on Washington St., I valued the lot facing Third St., 38 feet side by 127 deep, at $50 per front foot. For the balance, 12,386 square feet, or 220 feet in rear of lots on Washington and Main, I added 15% for Washington St. frontage, or $4,950. I added this to Washington St. frontage, because this would give the property on Washington St. and entrance to the rear, or place to extend their buildings; it would be worth more for that than for any other purpose.

On same exhibit, description 30, and between Third and Fourth Sts., I valued 270 feet on Third St. at $40 per foot, and 120 feet on Fourth St., at $30 per foot, and 250 feet on Maple St. at $20 per foot, making a total of $19,400.

In description 31, lands lying between Fourth and Fifth streets, I valued land on both streets, 120 feet deep, at $20 per front foot, with a depth of half way across the block.

1080 On description 33, I placed a valuation of $19,000, on 54.69 acres, and included in this $7,000 on 35 lots on Washington St.: the balance I figured as acreage, at $12,000.

On Complt.'s Ex. 6*a*, Riggs, in this description, a parcel of 4.09 acres, divided into a tier of lots on Washington St. and acreage in the rear, I valued the lots at from $300 each, starting from Park St., to

$250, up to Seymour Ave., and the area back of that to the south at $180 per acre; this value would extend through the green parcel, 7.15 acres to the south, and west to Seymour St.

Nester Add. is in this neighborhood, north of Washington St., Block 1 has 16 houses on 26 lots, block 2 has 10 houses on 29 lots, block 3 has one house on 26 lots, block 4 has one club house on one large and 17 small lots, block 5 has no houses, block has one house on 26 lots, block 7 has 7 houses on 31 lots, block 8 has 7 houses on 23 lots, block 9 has one house on 26 lots, and blocks 10, 11 and 12 have no buildings.

West End Add. lies directly west and north of Nester's Add.; it has no houses—about 157 lots. Homestead Add. lies south of description 33; it has 6 houses and a greenhouse, on 103 lots.

In description 34, right of way from tract 33 to fly switch at end of Dead River railroad, I valued at $100 per acre, same value we placed on adjacent lands. I was present at sessions of Board which placed these values; Harlow Clark, in the immediate neighborhood protested against the assessment.

In description 35, right of way from description 34 to west city limits, 2.29 acres, I valued at $100 per acre, same as adjoining property.

1081 In description 36, right of way, Dead River railroad to to North Marquette through the West End plat, approximately 160 rods, I valued at $100 per acre; following on from the West End plat, through section 15, at $30 per acre; section 10 at $50 per acre; lots 3 and 5 in section 11 at $100 per acre; sections 2 and 11 at $160 per acre; beyond the West End plat, land adjacent to railroad is cleared, but not improved—stumps and brush most of the way.

In description 38, from Marquette city limits, on south line, to Eagle Mills junction, I think value placed was $5 per acre on vacant lots adjoining city, but did not value it myself.

In Marquette, I made personal investigation as to conditions, and verified sales values as taken from records; had a considerable number of sales there. In verifying sales, I learned, either from buyer or seller, or someone that knew, the actual consideration and conditions of sale; we made inquiries of many people. After the investigation, I felt competent to place these values. The values in each instance are my judgment, based on value of adjacent lands without improvements in shape of buildings and structures.

Mr. Harlow Clark protested to the Board against a value of $100 on lands west of 72 acre tract; he claimed it ought not to exceed $75. Mr. O'Meara protested against values placed in vicinity of description 15. The values against which he protested were the same as placed on the 184 feet in description 15; his property is directly across the street, on the corner.

In description 30, Mr. Clark appeared for the same reason he did before. His property lies across Maple St. directly adjoining on the south; values on his lands were fixed on the same basis as values fixed on this description; he claimed they were too high.

1082 I had a sale on south side of Washington St. between Front and Third Sts., lot 2 of block 15, at $4,200; it was bought

from an estate, for purposes of building Elks Temple; it had 38½ feet frontage, and a building which was sold for $150 and removed.

HORTON.

Cross-examination.

By Mr. Eldredge:

I went to Marquette Feb. 22, an stayed until October; I worked on city of Marquette to June 1st; started outside in March and April and when weather got so we could. We had six assistants part of the time—two during May. I finished Marquette some time in June; had two assistants after June 1st. Mr. Twiss was there abount five weeks in April and May—maybe first week in June.

I personally reviewed the property that the examiners had examined, and examined and placed value on a portion of the city, myself; in reviewing property, I took the examiners' notes and valuations, and made comparisons; I went out and saw the property, and made inquiries about it. Mr. Hubbard, Mr. Keith and Mr. Davis were examiners; none of them lived in Marquette.

On east 50 feet of lot 5 of block 11, lying next east of opera house on Washington St., I found, at time of inspection, a vacant lot assessed at $4,000 for 1912; the committee placed a valuation of $6,500 on it; I valued at $8,000 for 1913, after the sale, thinking the party paid too much. He was forced to pay more than it was really worth, it being the only vacant lot left.

We tried to place the true cash value in every instance—the usual selling price under ordinary circumstances. When there had been no sales in the neighborhood, we would try to find out what anyone would pay for it, and what the owner would ask for it; that would assist in helping us to place a value on it.

1083 On Washington St., each way from the corner, we made very little difference in the value of the land over that on Front St. I valued property on Washington, corner of Front, at $200 per front foot, $175 for next lot, and $150 for the remainder in the first block; I put same value on west and east sides of street, as far as Main.

In description 24, I placed value on 697 feet frontage on Front St., between Washington and Main, at $150 per foot; it lies right next to Marquette County Savings Bank, which stands on one of the best corners in the city, which we valued at $200 per front foot. I found no sales there; I valued lots on the corner of Front and Washington at $200 per front foot, and property on side of Front St., opposite Savings Bank, at $150 per front foot; in other words, going west on Washington Street, I put a valuation of $175 per front foot next to the corner, and, on Front St. $150 next to the corner.

On that basis, the Jopling purchase would have been $7,500; I put $8,000 on it, because I thought that was about what it was worth. I valued the opera house and all the way to Third St. at $150 per front foot. The land sold to Elks Temple was left at $4,500; I paid

more particular attention to frontage; Elks lot frontage was 38½ feet; I estimated the depth, but knew it was a shallow lot. I valued west side of Front St., opposite the 69.7 feet of parcel 24, at $150 per foot, and put the same value on both sides of street. Property on Front St. is of no greater value than property on Washington St. I wouldn't make any great difference.

On item 29, after valuing lot on Third St. 39 by 127 feet, that left 12,386 square feet; in valuing this at 15% of Washington St. frontage, I only went to within 127 feet of Front St. The valuation to Front St. had already been placed in description 24. I placed this
15% valuation, because it would add 15% to value of Wash-
1084 ington street frontage by having that extension. The 15% is my judgment of value.

We used the committee's valuations where we felt justified in doing so; we were governed by them, to some extent. I valued railroad property according to my idea of value of nearby or adjoining property.

In description 33, I valued the 35 lots on Washington St. at $200 a lot, $7,000; about 15 lots would be on the 4.09 acres. I valued the remainder of the 54 acres, together, at about $180 per acre; depth of Washington St. lots is 124 or 132 feet.

I valued lots in Harlow's Add. No. 3 at from $300 to $400 each; they were all 50 foot front, and varied in depth from 80 feet, next to Fifth St., to 125 feet on Park St. end. I had reference to values from Seventh to Park Sts. in fixing these. Lot 40 in this addition is worth $300. I valued 15 lots at $300; they would average 50 by 132 feet—six lots, or $1,800, to the acre. I valued land immediately south of those lots at $180 an acre; they are not available at present. I arrived at the $1,800 an acre value for lots on Washington St. by simply placing a lot value on an improved street. I arrived at the $180 an acre value by what I thought it would sell for; that was on the basis of 70 acres. This 70 acres covers the south half of northeast of section 2 lying south of center of Washington St., produced, except part used for railroad purposes, and except 528 feet wide, described in Liber K. of Deeds, also part of southeast of northeast of section 22, lying between right of way of D. S. S. & A. and that of former B. De N. & M. railroad.

I valued lots on north side of Washington St., from east line of Seymour Ave., west to Lincoln Ave., at $250 to $350 a lot; they are 50 by 142 feet.

1085 I valued lot 14 of Nester's Add., without improvement, a corner lot, at $350; lot 1, in same block, a large lot in the corner, next to park, at $500—no house. I valued lot 1 in block 3 at $200, and lots 11, 12 and 13, together, at $525.

I valued lots 7, 8 and 9 of Homestead Add. at $70, together: they are 50 by 144 feet; lots 10 and 11, together, at $100; lots 20, 21 and 22 and 23, together with a small barn worth $50, at $400; lot 24, assessed with three others, including a greenhouse and residence, at $100 each; lots 36 and 37, cut by the railroad, together, at $50; lots 44 to 67 at $20 each; they are 50 by 112 feet; lots 68 to 73 inclusive at $20 each.

I valued the lots of block 4 in the tract 300 feet square in Nester's

Add., 6 lots facing Washington Street, at $100 each; those on Bluff St. at $20 each. I valued west 40 feet of lot 5 of block 1 of this addition at $1,700, including the building; I passed my judgment on that personally. The other 10 feet of this lot, included with lot 4, I valued with the building, at $1,200.

I would value the tract of 4.09 acres at $7,500; I figure the acreage adjacent to the lots at $200 an acre. There are 15 lots, at $300 a lot; I only figured 13, and I figured the remaining two acres at $200 an acre—$4,500 plus $400, a total of $4,900.

I valued the 3.56 acre tract, immediately south, and the 7.15 acres south of that, at $180 an acre. I would value description 32, 5.16 acres, at 200 per lot, for 90 lots.

In my valuations above, and of railroad property generally, I took conditions as they were; the use to which the property might be put was not considered, to any extent. I arrived at my values
1086 by applying the value of nearby and adjoining property. I valued the two acres south of the lots on Washington St. at $200 an acre, simply as acreage property. I assumed a valuation for 70 acre tract, and then applied that acreage value to everything except what lay on Washington St., considering the location.

As to a bona fide offer of $2,700 for lot 5 in block 1 of Nester's Add., I valued it at $1,700, cash value; I have known of such changes in six months or a year.

In block 3 of Harlow's Add. No. 21, on Washington St., I valued lot 1, without improvements, at $100 per front foot; it is 50 feet front and 90 feet deep, across from the post office; I would run the rest of the block at $75 per foot. In the next block west, I would put lot 1 at $75 per foot and the balance at $50, to Fifth St. On Harlow's Add. No. 2, there were some old buildings of practically no value; I valued that at $15,000.

I valued description 27 at $150 per foot on Front St., and at $40 per foot on Third St., running back 124 feet; $45 per foot for 326 feet facing Main St. I considered how that property could be utilized to best advantage by filling cut in Main St. and facing some of lots on that street; I included the cut in my valuation.

I judged that property on Washington St., from Front to Third Sts., was of equal value with that on Front St., south of Washington. I found out what rents were paid on the two streets; I inquired of owners or occupants, every one of them; I took every business block in Marquette. If we were not able to find the owner, we got it from the occupant, or some one that knew.

In valuing description 6, I compared it with lots 10, 11 and 12, adjoining it, farther west, across the street. I considered
1087 property on Burt & Ely Add.; I considered, generally, property in vicinity.

Property adjoining on north and east is railroad porperty; Gas Company is in that. Mr. Twiss valued the gas plant at $25,000; he valued the corporations.

I compared tract No. 8, being 12 lots between Division and Adams Sts., in John and William Burt's Add., with lots in same addition.

In valuing description 11, I considered lots in that vicinity and Penney and Vaughn's Add., and the same for description 12.

In description 18, I valued the 150 feet frontage on Spring St., including the irregular parcel across the street, at $20 per foot.

The south half of the southeast of section 10, Dead River branch, is better land than that southwesterly of it; it will bring more money, being adjacent to platted portion on north end of city, the fair ground and improved farms surrounding it in the north half of the northeast section 15. The greater value of this Dead River branch in section 10 over the land lying southwesterly of it is caused by the difference in land value between sections 15 and 10, condition of land, improvements, etc.

The south half of southeast of section 10, owned by Mr. Neidhart, I assessed and valued at $50 per acre. I began $100 valuation in lot 3, adjoining plat of north Marquette; I assessed the land at $100 per acre. I began $160 valuation in sections 2 and 11, north line; it was assessed locally at $160 per acre. I did not assess lot 5 of section 2; that is a part of Presque Isle Park.

1088 HORTON.

Redirect examination.

By Mr. Wykes:

The map I used was made in 1894. The plat in section 14, was made since then; I don't know when; it now includes Marquette Land Co. plat No. 1.

In valuing the Jopling purchase at $8,000, I considered the claim that he paid more than it was worth, because it was the only available lot, and he had to have it. I did not consider myself governed by the committee valuation, but was influenced by it somewhat. Our work in Marquette was part of a general campaign to bring assessed values in the state to cash value.

On Washington St., I put the lots in Nester's Add., a little higher than on south side of the street; that is the best side of the street; a higher and better location, and a better class of buildings.

In valuing description 32, I considered the necessity of extending Spring St. through the tract, to make those lots available; I valued it as a tract available for cutting up into lots, and placed a lot value on it.

In valuing the 4.09 acres in description 33, after taking the first row of lots on Washington street, I considered the remainder as part of a much larger tract, and my value of $180 per acre was placed accordingly; I would have put a higher value if I had considered a second tier of lots south of first tier. I would consider those lots worth $100 each. In the green part, I would not have put a higher value on the 7.15 acres if considered without regard to the entire 50 to 70 acres; I would figure the next row of lots back from the front at $50 each, and still drop off from that on the fourth row. The second row of lots would be $600 an acre.

1089 In fixing values, we took into account the location, distance from center of town, character of buildings and lands in the vicinity, and everything that should be considered. On the Dead

River branch, the values I have stated on property adjoining railroad are the prices at which we assessed it.

HORTON.

Recross-examination.

By Mr. Eldredge:

We gave the taxpayer the benefit of the doubt. Lots 3 to 7 inclusive, in Harlow's Add. No. 5, all have buildings on. I valued lot 7 and the east third of lot 6 at $500, exclusive of buildings. We figured the lots at $300 each, without improvements. Lot 15 was figured at $300, lot 16 the same, and 17 to 21 inclusive at $250 each; lots 8 to 14 were figured at $400 each, on that side of the street.

In Baldwin's Add., opposite, between Fifth and Sixth Sts. on Baraga Ave., lots 7 to 16 were figured at about $400 each; between Sixth and Seventh Sts. $400 on the corner of Seventh, and the balance at $350. Lots 54 to 59 inclusive are very poor lots. The figures I have been giving are on Rock St.; there is no lot 59 in this addition on Baraga Ave. That would be Hiram A. Burt's Add.

West of Seventh St., on the north side of Baraga Ave., in Harlow's Add. No. 5, the lots are very poor—lot 59 at $200, 58 at $100, $50 on 57, $75 each on 55 and 54. The committee's valuation on lot 54 was $50, 55 at $80 and 56 at $150; their value included building and lot, except on a few vacant lots. Lots 51 and 52 were vacant lots; on the south side of Baraga, lots 54, 55 and 57 were the only vacant lots. The Committee's valuation on lot 57 was $50, $80 on lot 55 and $50 on lot 54.

1090 In the same addition, between Sixth and Seventh Sts., lots 30 to 37, fronting on Spring St., were put in at $300 each; on lots 22 to 29 inclusive—the corner lots were placed at $400, and intermediate lots at $350. Of lots 38 to 42 inclusive, on Seventh St., between Baraga and Spring, the corner lots were figured at $300, and the lots between at $250; none were vacant. Lot 46 on Spring St. was figured at $150, and lots 47 and 48 at $100; lots 46 and 47 were vacant. The committee valued them at $90. Lot 45, also vacant, facing on Baraga, was valued at $150, lot 44 at $200, and lot 43 at $250; none vacant.

Property north of Spring, between Spring and the railroad, and between Fourth and Fifth, we valued at $20,000; we did not separate them, we included value of improvements. A portion of it is Harlow Park. My values were generally accepted by Tax Commission.

HORTON.

Redirect examination.

By Mr. Wykes:

I think there was one instance in which a reduction was made on protest. Between Baldwin's and Harlow's Add. No. 5, on Baraga Ave., it is just fair—not as good as Rock St. above. Spring St. is very poor; the houses on it front on the railroad property.

On March 26, 1914.

HORTON recalled.

Further cross-examination.

By Mr. Eldredge:

Mr. A. E. Creith did the preliminary work in John Burt's Add.; I reviewed his work. In the field notes for the whole addition, following the description of the property, appear two sets of figures; the first one represents the 1911 assessment and the second
1091 the 1912 assessment, and in another column, usually in pencil, are the Marquette committee's figures. The third column of valuations is the final price fixed by the Tax Commission.

I was thinking of J. & W. Burt's Add. Mr. Hubbard is the man who made those notes on that (John Burt Add.). I reviewed them. The notes following the *the* valuations, after each property, are Mr. Hubbard's writing.

The examiner reported lot 1 of block 1 at $4,500, and it was assessed at $4,200 by the Tax Commission. Mr. Twiss and I reviewed the examiner's figures on this plat; where we found it was a little high, we made the reduction. The blue figures are my judgment on that property, made at the time. The Commission adopted our figures in nearly every instance; where they did not, it should appear from the complaints, more than it would on the roll. Unless there has been some complaint, there would be no change.

I have no recollection, in this particular instance, why I did not adopt the examiner's valuations; it was my judgment it ought not to be any higher than it is placed there in comparison with the actual value of the surrounding property. We did not always agree with the examiner. The same examiner reported the surrounding property; I do not know whether there was any change made in that.

The memoranda showing that lot 2 of block 1 was verified at $3,500 was done by some one previous to the time we went there; the sales put on the year before by Mr. Metcalf; I don't know anything about that. That was a verification of a sale made Sept. 12, 1910, according to the record. That "verified" is misleading. The sale shows $1,500; evidently, the property was improved after the sale, *or* borrowed money—something we often find.

The record shows a verification, in red ink, for lot 6 of block 1; verified value, $2,000; purchased at $1,500. Mr. Asire veri-
1092 fied that at $2,000. My verified value in red ink cannot have reference to the verification by Mr. Asire.

"Borrowed money" means that they borrowed $1,500 on some parcel; it might have covered both parcels; I couldn't say.

Those sales were taken off and that work done before we went to Marquette. These red ink notes mean nothing, so far as my valuation is concerned. They might have influenced us some after our verification. They are not the verified sales to which I testified on my previous examination, only where we verified them ourselves.

The record of those we verified is found on the notes; very often, the verification agrees with the previous one.

I do not remember anything about lot 4, block 2. Very often, on our second examination we found conditions that the examiner did not find at the time he was present.

The record shows that lot 8 of block 2 was sold on Jan. 4, 1912, for $2,800. I assessed it at $2,600, for the reasons that many other properties were assessed—very often we find the man paid more than we consider true cash value; that is, the usual selling price under ordinary circumstances. By "true cash value" I mean the price that the property can be sold at in a reasonable length of time.

We make a distinction between cash sale and sale on time. We always inquire into these sales to ascertain whether they were sales for cash or on time. The difference we make varies with the class of property, the length of time, and the rate of interest. Very often, we find property sold on contract for 10% or 20% more than its actual worth. By "true cash value" I always mean a sale
1093 where the payment was made practically all in cash or as good as cash, at the time of the transaction.

The "vertified value $4,000" appearing in red ink, opposite lot 9 of block 2, means that one of the examiners might have placed $4,000 on it at the time Mr. Metcalf was there. The work was done in the middle of the winter, when the property was not in the shape it was in later on. These examiners were supposed to be capable of arriving at the true cash value; they were working under a disadvantage at the time, on account of weather conditions. I reviewed the property later on, when the conditions were different. None of the examiners were residents of Marquette, nor familiar with Marquette properties and values before they went there. Mr. Metcalf went a year before we did. There is a note there to the effect that our own examiner reported to us that that property was low at $4,000.

The memoranda in red ink opposite lot 23 of block 2 indicates that a sale price of $2,900 on that property was reported to me on April 9, 1912.

I assessed the property at $2,350; I considered that was all it was worth. I do not remember that instance specifically. Very often, we find a man buys on long time and gets his deed later on. Those records in red ink show the price of the contract; it shows in the deed perhaps 8 or 10 years later. It does not appear whether it is a sale on contract or not. The contract price is put in the deed sometimes five years after the sale. I am not saying that it would represent in my judgment a value five years before. If a man paid that in cash five years before, and the property and conditions remained the same, it would have some effect in showing valuation. If he paid it in cash, secured it on the property, and paid interest on it, there would be a difference according to the conditions under which he purchased it in the first place. The fact that this was
1094 reported as a sale at $2,900, and then verified at $2,900, means that the party may have paid on contract; we have no way

of knowing, without seeing the party himself, which we always do before accepting a verification.

The liber and page following the amount at which verified refers to the record in the Register of Deeds Office at the time the deed was executed. I am not saying the party did not pay $2,900; I said possibly it might have been; I do not know. We do find those circumstances in general instances where a man has bought on contract; sometimes $1,000 more than the property is worth; it goes on record, when he gets his deed, at the amount placed in the contract.

I valued lot 6 of block 3, same addition, at $7,500; the examiner valued it at $7,000. I remember the property; it is on the corner of Third and Ohio Sts.

I had a sale showing purchase price of $1,650 on lot 10 of block 3; I valued it at $1,500. I remember Mr. Begole's property at Marquette; there was no question when I valued it, nor is there now, as to whether it was valued at its true cash value.

The notes on the east 75 feet of lot 6 of block 4 show that the examiner reported that the owner said he would not sell for less than $10,000, that he had been offered $10,000, and that in the examiner's judgment it was worth $8,000. That later appeared before the Commission; the figures were fixed on account of the owner being a widow; she was given some concessions on that account. Those figures were fixed by the Commission and not by me; I couldn't say what figures I fixed; they have been erased.

I couldn't say whether it was because the owner was a woman or a widow; that was left to the local Board of Review. It was on the recommendation of the assessor that that amount was
1095 reduced. I couldn't tell in whose handwriting the word "woman" is; it is not mine.

I remember the Hargrave Flats on lots 1 and 2 of block 5, and the considerations that induced me to reduce it from $42,000 to $40,000.

I don't recall lot 9 of block 5, belonging to Annie J. Connell; the value placed upon it was not reduced because the owner was a woman.

The blue figures were the figures I reported to the Commission, except where changed by them; the exemptions for widows, etc., were on the recommendation of the local Board of Review and assessor. It has been the rule to follow their recommendation. They have a list of widows who have been partly exempted; we had access to that, and also took it up with them, to see if they still thought there ought to be the exemption.

We fixed the amount of exemption upon their recommendation; we considered what they commended, and then used our judgment. We invariably made an examination to find whether these parties were able to bear any part of the burden of taxation or not. We did not consider we had a right to exempt them in whole or in part.

Opposite lot 12 of block 7—name, John P. Kern, now dead—the value fixed by the committee is $2,500; our value is $1,500, part exempt. Our recomendation to the commission as to exemptions

for widows and other poor people was sometimes for the whole, and sometimes in part.

I cannot tell what lot 3 of block 12 of John Burt's Add. is assessed at; the description is (reading from notes, a two story upright, wing and lean-to, stone foundation, steam heat, hardwood floors, grate, hardwood finish below, 15 rooms, all modern, 1096 near car line, good, low at $4,800. The assessed valuation is $4,800; Mr. Twiss made it. Property in that neighborhood is fairly desirable property, as I remember it. We usually take into consideration, in valuing a property, the number of bath rooms it has. The examiner said the property was low at $4,800; Mr. Miller's O. K. was that $4,800 was the cash value. He is an attorney connected with the D. S. S. & A.

Mr. Miller appeared at the review in several matters, I believe. I was also present. We had already arrived at the true cash value; Mr. Miller O. K.'d it; he took the matter up with his clients, and it was agreed on at that time. I couldn't say that we reduced any values on the representation of Mr. Miller for his clients.

The examiner was Mr. Hubbard; he reported it low at $4,800 at the time he made the examination. In my judgment, it was not low at $4,800, as I remember. I don't remember that particular property now. Mr. Twiss put those figures on there.

I couldn't say whether property in that neighborhood has increased or decreased in value in the last year, or for some years prior to the time I was there; we made our valuation on the condition we found at the time. Very often, where we thought necessary, we made an examination to find what the property cost other than as noted on the report covering John Burt's Add. That record is in the field notes.

1097

Description.	Sale price verified.	Valuation or assessment.	Remarks.
Hargrove Apartments.....	.....	.....	Sale only indicated cost of lots, and all the improvements, which were the greater part of the property; were put on after the purchase.
Lot 9, block 1....	$2,500	$2,800	Verified 5 years before.
Lot 6, block 1....	2,000	2,000	Purchased 5 years before at $1500. It says borrowed money, though I couldn't say that was the purchase price; simply a record our card shows that other people verified, borrowed money at $1,500. It doesn't show the purchase price at all.
Lot 4, block 2....	1,000	1,500	Verified 4 years before.
Lot 4, block 3....	2,000	2,000	The deed called for $1; verified by the owner at $2,000. We don't take the record for it entirely; we go to the people and find out what they paid for it. Our note shows we found the purchase price to be $2,000. I guess it says "not verified"; I got it mixed.
East ½ Lot 12, block 8, and all of lot 9.....	4,000	4,300	
Lot 24, Block 8....	2,900	3,000	

We verified the price paid for the property, the conditions of the sale, etc. It has been the custom to use that word "verify" after an examination of the property and interviewing the buyer and seller or someone who knows the actual consideration. I use the word "verify" as meaning to ascertain the actual consideration. We take the sale, to locate the property and the people. It is a verification of the sale, and not the actual price alone. I don't consider myself bound by the price as showing present value; the conditions may have changed.

1098 I do not recall anything about lots 5 and 6 of block 8. The figures, $3,000, opposite, are mine. As to the statement that it was purchased in 1908 at $1,000, and verified at $1,000, that is what they paid at that time. The words "verified value, $3,600" are not my work, at all, but that of some one employed by Mr. Metcalf. That is not true throughout the report I made to the commission concerning John Burt's Add.; some of those sales were taken the year previous and verified during the winter, at the time we were there copying the rolls.

I couldn't point out the sales, the records of which were obtained by my assistants or myself, in that book. The handwriting in red ink was all by the same man. It was a matter of record before we did any examining in Marquette only some sales were verified the

year before we went there by Mr. Metcalf and his assistants; those cards were put with the sale cards we had when there, and they were all put on the book at the same time, by the same man, who knew nothing about the sales, but was simply acting as clerk.

Mr. Wykes: I don't want this record to stand, as it does, that Mr. Horton has looked through that book and given the only description where the value actually placed was either equal to or above the verified consideration, because he has not gone through the book.

Our force went there in February, 1913. In examining the sales record, we only had to cover 1912, but we investigated all the sales appearing on this book; but, in some of them, the notes were made on cards and entered here as verified by Mr. Metcalf and his assistants, and I cannot distinguish between the two from the writing. After the cards are placed on the book, sometimes they are sent back and sometimes not. They are simply taken on the cards to
1099 get them off the records, on to our field books.

(Witness testifies as to various descriptions, sales as reported, verified value, verified sale, and valuation and assessment of same, as follows:)

1100

Description.	Sale as reported.	Verified. Value.	Verified. Sale.	Present valuation by— Owner.	Present valuation by— Metcalf.	Present valuation by— Our force.	Assessment.	Remarks.
Lot 2, Blk. 1, J. Burt's Add.	$1,500 in 1910.	$3,500 by our force.	.....	.....	.....	.....	$2,700	Bought 3 years ago on contract.
Lots 4-5, Blk. 1.....	.....	.....	.....	.....	.....	.....	.....	No bearing on value.
Lot 6, Blk. 1.....	.....	.....	.....	.....	.....	.....	.....	Already testified as to that.
Lot 9, Blk. 1.....	.....	.....	.....	.....	.....	.....	.....	Ditto.
Lot 16, Blk. 1.....	.....	.....	.....	.....	.....	.....	.....	No tendency to determine present value.

1104 I made the examination of Harlow's Additions 1, 2 and 3 inclusive; the notes are all mine, except verifications carried over from cards, through the entire book. The sales appearing in red ink and those made prior to the fall of 1911 were verified by Mr. Metcalf's men during the winter of 1911.

Harlow's Add. No. 5 was examined by F. E. Bush, and the work approved by myself. Lots 1, 2 and 3 of Nester's Add. No. 1, were examined by both Mr. Twiss and myself. We did not follow the committee's valuations in all cases.

(Report covering Harlow's Additions 1, 2 and 3, pages 71 to 83 inclusive, offered in evidence and marked Complt.'s Ex. 90, Horton, March 27, 1914; also report covering Harlow's Add. No. 5 offered in evidence and marked Complt.'s Ex. 91, Horton, March 27, 1911; also report covering Nester's Add. No. 1 offered in evidence and marked Complt.'s Ex. 92, Horton, March 27, 1914.) (Objection by Mr. Wykes so far as they are not lands nearby or adjacent to the railroad, and not shown to be such.)

Yesterday, the values I placed upon certain lots, separate from improvements, in Harlow's Additions 1, 2, 3 and 5 were from memory and my having access to the maps of that plat accompanying the record. The map accompanying Complt.'s Ex. 90, Horton, which covers Harlow's Additions 1, 2 and 3, is supposed to be a map of the plat of those additions cut from a map of the city of Marquette compiled by E. A. Johnson and J. S. McCarthy, dated in 1894; I think they are the same.

The map refers back to the location and time I did the work; it only refreshes my memory. That is not true of Complt.'s Ex. 92, Horton, Nester's Add.; but values are given there in the majority of cases. An inspection of the exhibit will show those values
1105 separately, wherever they are given. In Harlow's Add. No. 5, where the notes show improvements on the lot, I rely upon memory for the value. There are also vacant lots listed there.

HORTON.

Redirect examination.

By Mr. Wykes:

(Board's record of field notes and assessments on John Burt's Add. marked Defts.' Ex. 51, Horton, March 27, 1914.) On that exhibit the second column shows the committee's valuation in dollars; the third column, in blue pencil, is the Commission's figures; that is, our recommendation as to the value of that property as adopted by the Commission. Where the Board did not adopt our figures, they were changed to correspond with the value agreed upon by the Board, so this record would not entirely show our recommendation in those instances. This exhibit was made previous to the assessment roll, and is the data upon which the official roll was made up.

The local assessors still make their assessment roll, in which they

place their estimate of the value of property; these exhibits are parts of a roll prepared by, or under the direction of, the Tax Commission, and the changes made by the Commission in the local valuation are put on the local rolls, in a column provided for them; with that exception, each valuation is carried out by the Commission, whether there is a change or not.

I find among the Commission's records seven protests against high valuations in John Burt's Add., nine in the Harlow Additions, and 62 in Marquette city, entire. I find a protest for the corner of Front and Baraga, by Mr. O'Meara; also for the northwest corner of Front and Washington.

Between two men, assumed to be equally competent, valuing a piece of property independently for the same purpose, I
1106 wouldn't consider a difference of 10% between them unusual. I would regard as unusual a variation in values from $10,500 to $39,000 for the same property.

There were building- on the lots in John Burt's Add., as a rule, and in fixing our values, the condition of the buildings was always taken into account. Assuming a sale in 1908 and a valuation in 1912 or 1913, without repairs, I would not regard the building worth as much in 1913 as in 1908. Assuming the ordinary repairs, painting, etc., it might be worth as much, and might not. I recall no peculiar conditions relative to valuations in John Burt's Add.

I couldn't say whether I investigated to see whether land had increased or decreased in that particular addition. Taking into account the things called to my attention by Mr. Eldredge, there is nothing that would lead me to change my judgment on the plat as a whole.

The field man's work was done in Marquette during March and the first of April; my work was done in May. May would be the better time to make a complete inspection and examination in that section of the country, where the snow hinders more or less.

HORTON.

Recross-examination.

By Mr. Eldredge:

Of the seven protests in John Burt's Add., five were over-ruled by the Board; in one instance, they reduced to $2,500 a property which we recommended at $2,700; and in another, from $2,500 to $1,500, part exempt, on the recommendation of Mr. Primeau, City Assessor; that is, they exempted a part of the value I had included. The reasons for making the complaint, are that the owner is a widow; owns another house, that rents for $16 a month; owes $550; son
1107 and daughter at home pay board. Board of Review reduced value because of circumstances.

Of the 62 protests in Marquette, two of them related to personal property; one of them is marked no protest, and the other is marked assessed at $65,000.

1108 On March 25, 1914.

FESTUS R. METCALF, a witness called by defendant.

Direct examination.

By Mr. Wykes:

I live in Adrian; I am 66 years old. I am in the service of State Board of Tax Commissioners, and have been for 10 years. My work at present is mostly corporation valuation. I have done all kinds of work for the Tax Commission; I started with farm work, but have been doing nothing but business, city and village property for four or five years; almost exclusively on corporation work the last two years. When I view business property in a city, the foreman usually works with me; that is, foreman of a force of field men; with corporation property, I work alone.

I did no re-assesment work in Baraga. Two or three years ago, I had a force of six men doing preliminary work in Marquette. This was additional to work done by Mr. Horton. The local committee was appointed while I was there, and the Commission had me examine and verify all sales made in the two years, and use it as supplemental to their work; I put no figures on property that year.

When I go to a place to value property, I first get the judgment of the people who live there. We have used sales to verify our judgment, but the general consensus of opinion of people dealing in real estate fixes the value of it, taking into account bids, offers, sales, etc.

The first I knew I was to testify in this case was about two weeks ago.

METCALF.

Cross-examination.

By Mr. Eldredge:

There is no secrecy about our work when we go into a town to begin valuation work; everybody knows we are trying to find valua-
1109 tions for taxation purposes. In my experience, public opinion is the strongest factor in establishing land values; that is the opinion of those who own and buy and sell.

METCALF.

Redirect examination.

By Mr. Wykes:

I get the expression of that opinion in part from actual sales; also bids and offers.

1110 On March 25, 1914.

J. R. DAVIS, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live in Lansing; I did live in Bay City; I am 40 years old. I have been with Tax Commission for 10 years; left them in January, 1914. I was employed by Tax Commission for four years, at general office work and assisting some on outside, part of the time; next two years as a clerk on field work, and part as examiner, and the past four years as examiner; on outside work exclusively for three years.

In examining property, I placed valuation on it. My first work in placing values was in Grand Rapids about eight years ago, on equalization work, assisting Mr. Parker; that was getting data to give to State Board of Equalization. Three or four years ago, I worked in Charlevoix County, assessed Boyne City, and assisted as examiner in general work through the county. I also did some readjusting of valuations in townships; that would involve finding the cash value of the different districts. Two years ago, 1912, I worked in Ironwood; made examination there with Messrs. Horton, Hubbard and Mansfield. I also worked in Bessemer, Iron River, Iron Mountain; then, in Jan. 1913, Marquette County appraisal, assisted by Messrs. Keith and Hubbard.

I went to Marquette County in April; I assisted in Marquette city, and worked between Negaunee and Ishpeming and other points in the county until the latter part of August. Mr. Hubbard and Mr. Keith were with me all the time. In our work of reaching values for assessments, we gathered what sales we could, interviewing the people, in general, and endeavoring to find out what we considered a true basis of value. I got my information largely from business men, but discriminated against no one, and met anyone interested and intelli-

1111 gent on these matters. Our purpose throughout the work in Ishpeming and Negaunee was to reach true cash values.

My work had to do with surface values only; I did not take in mineral values. I have not checked the few differences between the figures I recommended and those that went on the assessment roll.

Beginning at the east line of Negaunee, the figures placed on the assessment rolls by the Tax Commission from my examination are: westerly through the S. W. ¼ of Sec. 33-48-26, $12 an acre; through the S. E. ¼ of Sec. 5-47-26, $25 an acre; N. W. ¼ of Sec. 5, $800 per acre; N. E. ¼ of Sec. 6, $2,000 per acre; N. E. of S. W. of 6, $2,500 per acre; N. W. of S. W. of 6, $7,000 per acre (that refers to both sides of track); S. E. of N. E. and N. E. of S. E. of Sec. 1-48-26, $1,000 per acre; northwesterly through balance of Sec. 1, $40 per acre; S. W. of S. W. of 32-48-27, $40 per acre; I think that carries you to the west line of city of Negaunee; the business part of Negaunee is in the N. W. of S. W. of Sec. 6-47-26, at $7,000 per acre.

From we t line of Negaunee the figures through the S. ½ of S. E. of Sec. 2-47-27 are $75 per acre; S. ½ of S. W. of 2, $35 per acre; S. E. of S. E. of 3, $300 per acre; S. W. of S. E. of 3, $2,000 per acre; N. E. of N. W. of 10, $8,000 per acre (practically in center of Ishpeming); N. W. of N. W. and S. W. of N. W. of 10, $2,000; S. E. of N. E. of 9, $200 per acre; N. W. of S. E. of 9, $35 per acre; S. W. of S. E. of 9, $135 per acre; and balance of Sec. 9, to west line of Ishpeming, $40 per acre. That is as far as I went through; further on are figures taken from assessment roll.

The figures up to this point are the result of my work, assisted by Mr. Keith and Mr. Hubbard, and they were my judgment of the true cash value at the time reported and now.

1112 No surface value was taken at Champion; that is a mining proposition, solely, and was assessed as such. I can give no separate values there, except as to my judgment of the values of property.

At the time I made these figures, I had no intimation that I might be called upon to testify in this case; I first learned that I should testify about a month ago.

Of the lots and assessments that went into the $7,000 area in Negaunee, the land value, from lot 1 on north side of Iron St. to intersection of C. & N. W. railroad, is $100 to $150 a foot. These lots are 33 by 130; they face two streets,—that is, they extend through to an improved street,—so that they have two building sites frontage. I think it was the values between there and the railroad that fixed the $8,000 value. On the south side of Iron St., from Gold St. easterly to intersection of C. & N. W. road, the lots would average about $100 per front foot. From the C. & N. W. tracks, on south side of Iron St., to Pioneer Ave., the lots directly across from those $150-a-foot lots ran from $75 to $95 a foot.

On March 27, 1914.

DAVIS, recalled.

Further direct examination.

By Mr. Wykes:

The figures I gave you were my average of the assessed values in those districts along the line of the railroad. They were not exact mathematical averages; I just applied my judgment on the territory as I went through. I took the assessments on both sides of the right of way. The figures would be the average value according to my judgment; it would, in a way, be my average of the assessments. In other words, my judgment of the value and the valuation of the assessments were practically the same.

1113 As to the property north of the railroad, in the vicinity of Iron St., at Negaunee, on the east side of Gold St., there are three lots back of the south side of the main business part; on the west side, two lots, fronting differently; on the west side of Silver St., four lots; and on the east side, five lots, running parallel with the

alley, facing Silver St., and between that and the C. & N. W. tracks; on the west side of Marquette St., five lots, and on the east side, four lots. The four lots would be about four and a half regular lots, as lot 65 is a wide lot. At Pioneer or Division St., there are three lots on the west side; the east side is taken by the city fire department block. That is the east end of the business district. On the east side of Silver St. are four or five lots that run into a corner 210 feet on Silver St. and 200 feet on the railroad, about .48 of an acre.

I verified the Winter & Suess sale, on that, at $2,200. There was a peculiar condition in that sale, which I might explain. The gentlemen buying the property supposed they were buying lots 45 and 74 to 78 inclusive, which would make the complete property between Silver St. on the west, the C. & N. W. right of way on the east, and the D. S. S. & A. on the south, but, when they came to record their deed, it did not include lot 45, a very small "v" shaped lot close to Iron St., but with no outlet on it, and they were forced to pay $300 for this lot, to complete the property, making the total paid $2,500, including the point.

There is no business south of the railroad in that immediate vicinity, except on the extreme east end of the property we have been describing; that is Pioneer Ave. as continued.

The assessments on the land south of the track would average about $400 per lot; a little less directly south from the section line of 1 and 6 to the west ⅛ line of 6. It would be a tier of lots on the
1114 east side of Gold St. and then easterly through to Silver, Peninsula and Bay de Noquet, and Division or Pioneer Ave. extended.

I found the highest values in Negaunee on the north side of Iron St., between Pioneer Ave. on the east and the C. & N. W. right of way on the west.

DAVIS.

Cross-examination.

By Mr. Eldredge:

The value on lots 61, 62, 63 and 64 of the Pendell plat is $40 per foot frontage; they front on Division St.; that is a continuation of Pioneer Ave.—a narrow street. They are 105 foot front on Division St. and 100 feet deep. Lot 64 is smaller; I think it only has about six feet on Division St., so that 10,125 feet area is nearer right than 10,500 feet. The valuation of that property was $4,000. That 10,125 square feet would amount to $17,205 an acre, we figured.

I cannot give the original size of lot 105, on the east side of Gold St., immediately south of the D. S. S. & A. It is apparently all taken up by the railroad, here, on the map, and what part was not taken up by the railroad was used as a driveway on the south side. It was assessed at $300. My notes on it read: "Is vacant and used as a driveway." I assessed it as a lot, as I saw it, $300.

I assessed lot 108 on Silver St. at $300; as I remember, it was cut on the northeast corner by the railroad. My value was on the portion

outside of the railroad; I don't know how much. These lots are 50 by 150 feet. I assessed lot 119 on east side of Silver St. at $300 for that part south of the railroad; I do not know how much it was. Maitland's Add. was in existence then. I assessed lot 1 of lock 2, there, at $1,000; lot 15 at $600. Lot 1 is 50 by 120 feet; lot 15 is 51.55 by 120 feet.

1115 I assessed lots 1 to 7 inclusive of block 29 of the Pioneer Add. for $1,800, as an entirety. Lots 4, 5, 6 and 7 were about six feet below the street line—a garden spot; lots 1, 2 and 3 faced the railroad on the south—very rocky. There was some personal property on those lands, small cottages and shacks, scattered along the railroad. I don't remember of any rock blasting going on in lots 1, 2 and 3; I think that was further west, on blocks 17, 18, 28 and 29. The entire south part of block 29, between Healy Ave. on the east and Brown Ave. on the west, is a bluff.

(Map of Negaunee offered in evidence and marked Complt.'s Ex. 93, Davis. Mr. Wykes admitted that red line in map marks southerly limit of D. S. S. & A. through Pendell Plat.)

Lots 1 to 17 inclusive—that is, the entire south side of block 28,—is rock bluff. The city has a stone crusher on lots 4 and 5. Lots 1 to 9 inclusive, the south side of block 17, are all very narrow lots; they might run into the bluff on the east side; part of that was used for gravel pit. The property of D. S. S. & A. in front of blocks 17, 28 and 29 was assessed at $275 an acre; I valued it at that.

I found a small part of the D. S. S. & A., immediately south of Lots 4, 5, 6 and 7, and perhaps lot 3, of block 29 of the Pioneer Add., had been abandoned. I valued the land between that abandoned right of way and the new, south of it—that is, between the Maitland and Reed & Winters Additions and the present right of way,—at $5,000; that is for the entire; that includes land both north and south of the present right of way between Healy Ave. and the Maas & Lonsdorf Add. For south of the track, the description reads: That part of the S. ½ of the N. E. ¼ lying south of main line of M. H. & O. railway west of west line of Maas, Lonsdorf & Mitchell Add. of Negaunee, and east of the extension of Healy Ave. continued. That is 10 acres, there.

1116 I valued the right of way across the N. W. of the S. E. of Sec. 33-48-26 at $10 an acre; N. E. of S. W., $10 per acre; S. E. of S. W. $12 per acre; and S. W. of S. W., $12 per acre. The next 40 on that (south) line would be the S. E. of S. E. of Sec. 32, at $30 an acre; the entire S. ½ of S. ½ of S. E. is set at $30 an acre. These figures represent the present value of this right of way, in my judgment.

In Sec. 5-47-26, I value the N. E. of N. E. at $15, N. W. of N. E. at $15, S. W. of N. E. at $40, and S. E. of N. W. at $800 per acre. I made my examination, on which I based these prices, in the summer of 1913. I knew this right of way had been recently purchased, but had never investigated it. I don't remember any sales in Sec. 5. As to this sale for railroad purposes, I knew nothing about it, and made no effort to find out.

As to this land just valued at $10 per acre, it is a question as to for what purpose it would be worth that; part of it was rough cleared. I valued the lands that the right of way runs through—approximately the same kind of lands; not the right of way itself.

In Sec. 5, the Pioneer & Arctic Iron Co. owns the S. W. of N. E.; the S. E. of N. W. is all cut up in small descriptions.

The land I valued at $800 an acre is pretty fair land, with good building spots, valuable for lot purposes. The land I valued at $40 an acre was mostly unimproved, some stumps and stone; fair land; the balance was cut up by railroad and swamp. There are about 12 acres in that 40 of no value except for railroad use. I valued that 12 acres at $80 an acre.

On the south line (of 48-26), I valued the S. E. of S. E. of Sec. 33, at $10, S. W. of S. E. at $10, and S. E. of S. W. at $12, per acre.

In sec. 4-47-26, I valued the N. E. of N. W. at $10, N. W. of
1117 N. W. at $10, and S. W. of N. W. at $10, per acre.

In section 5-47-26, I valued the S. W. of N. E. at $40, on an average, S. E. of N. E. at $12, N. W. of S. E. at $20, and N. E. of S. W. at $800, per acre. I don't think I valued the S. E. of S. W.; I think that is a mine; it is assessed as a mine. I think the surface rights were not assessed. I think that is a part of the Queen group of mines; there is no assessment on that, except as a mine. I valued that part of the S. W. of the S. W. lying south of the main track of the C. & N. W., except the L. S. & I. right of way, at $50 an acre.

I assessed lot 82 of the Iron or Pendell plat, separately, at $1,500; it has 45 feet frontage on Silver St. I assessed lots 83 and 84, together at $60 per front foot for the lots; lot 39 at $125, and lot 40 at $100, per front foot. Those two lots were assessed against Benjamin Neeley. They had buildings on them. Lot 39 had 33 feet frontage on Iron St., I think, and lot 49 the same. I assessed the entire property at $20,000.

I assessed lot 87 at $1,200, lot value—I couldn't answer as to its frontage. Lot 86 at $60 per front foot for 33 feet; that is on the west side of Gold St. Lot 87 has about 22 feet frontage on Gold St., I think; I didn't think the value was as good there.

DAVIS.

Redirect examination.

By Mr. Wykes:

I assessed the business district by the front foot; the larger tracts south of the railroad track as lot value.

At Ishpeming, I placed an average valuation outside the right of way between Third and Lake Sts., with the exception of a
1118 certain tract in the center, at $8,000 an acre. The tract in the center, between First and Pine Sts., would be worth $12,000 an acre.

As to lots adjacent to the railroad track in that neighborhood, I valued lot 124, the first lot south of the railroad, on First St., at $45 per front foot. There is no lot 125; it is a street. Lot 116 is railroad

property; no assessments on that. Lot 117 belongs to the city; no assessment on that. Lot 118, the same. Lot 119 at $40 a front foot.

Lots 120, 121 and 122 are divided the other way, with frontage on Cleveland Ave., at $60 per front foot, 105 feet deep. I assessed those lots. Lots 120, 121 and east 35 feet of lot 122 are assessed to the Upper Pensinsula Brewing Co.; east 35 feet of west 70 is assessed to Crowley; west 35 feet is assessed to Mine Workers Union. Lot 114 faces Main St.; value $150 per front foot. Lots 113 and 112 at same price.

Lot 111, adjoining the railroad, is assessed at $100 per front foot; it is given as a metes and bounds description with a frontage on Main St.; amount of frontage not given. I assessed it as 35 feet frontage; total, $3,500. I paced it off. There might be a difference as to where the line came in that right of way.

The Assessed values from the west limits of Marquette to the east limits of Negaunee (north line) are as follows:

From	West Line of Marquette			to	Mile Post	157,	$50.00	per	acre.
"	Mile	Post	157	"	"	158,	20.00	"	"
"	"	"	158	"	"	159,	15.00	"	"
"	"	"	159	"	"	160,	5.00	"	"
"	"	"	160	"	"	161,	3.50	"	"
"	"	"	161	"	"	162,	4.00	"	"
"	"	"	162	"	"	163,	6.00	"	"
"	"	"	163 to East Line of Negaunee,				6.00	"	"

1119 On the south line, they are:

From	West Limits of Marquette			to	Mile Post	4,	$10.00	per	acre.
"	Mile	Post	4						
"	"	"	5	"	"	6,	5.00	"	"
"	"	"	6	"	"	7,	4.00	"	"
"	"	"	7	"	"	8,	4.00	"	"
"	"	"	8	"	"	9,	5.00	"	"
"	"	"	9 to East line of Negaunee,				8.00	"	"

These are the assessments on each side reduced to the acreage assessment, extending 80 rods on either side, across the first 40 on either side of the track.

The assessed values per acre on lands each side of the road, from the west limits of Ishpeming to Baraga County line, are:

Mile post. From—	To—	Value per acre.	Remarks.
172	173	$8.00	
173	174	7.00	
174	175	5.00	
175	176	5.00	
176	177	5.00	
Low Moor Farm		12.50	
177	178	7.00	
178	179	5.00	
179	180	7.00	
180	181	5.00	
181	182	15.00	Humboldt
182	183	7.00	
183	184	5.00	
184	185	5.00	
185	186	32.00	Champion
186	187		Champion Mine
187	188	5.00	
188	189	3.00	
189	190	4.00	
190	191	3.00	
191	192	3.00	

The figures I have given are Tax Commission figures; they were taken from the field books of the Board of Assessors. These figures were on the bare land. I couldn't say whether there were no
1120 structures, or whether there were some and they were excluded. There is a possible chance that those figures were changed. I cannot say that the figures on the field books are the figures placed on the assessment rolls.

Mr. Eldredge: The figures of witness may stand as the Tax Commission valuation, but I do not waive my objection to the competency of Tax Commission valuations to prove the true value of the land.

DAVIS.

Recross-examination.

By Mr. Eldredge:

I valued the lots on Church St. lying immediately north of the north line of D. S. S. & A., just west of First St., exclusive of improvements, at $35 a front foot; that covers all the lots on the south side of Church St., between Main and First Sts.

Lots 1, 2 and 3 of block 2, fronting on Main St., valued at $80 per front foot. This value includes lot 4, also. They were laid out originally facing Canda St.

From First St., on the west to Pine St., I placed an average value

of $12,000 an acre, and from First St. east to Third St., $8,000 an acre. I would value the land occupied by the D. S. S. & A. passenger and freight station, terminals and right of way between those two points at $8,000 per acre.

I valued lots 133, 134, 135 and 136, on Second St., sold to the Government for a post office site, at $35 a front foot, exclusive of buildings. My total valuation on the four lots was $6,000, and $3,000 on the buildings, making $9,000 on the property.

1121 In getting at my average of $8,000 in Ishpeming, I used the values on and adjacent to the railroad, abutting on it.

I valued lot 145 on the opposite side of Second St., at $25 per front foot; it is lower than on the other side.

DAVIS.

Redirect examination.

By Mr. Wykes:

The frontage on Main St., immediately north of the railroad and corner of Canda St., runs back across lots 1, 2, 3 and 4; that is the depth of these lots. I mean that these lots west of Main St. on the north side of Canda Street, which were originally platted to face Canda St., front on Main St., and run back the entire length of the four lots.

Back of these lots are lots 5 and 6, facing on Canda St. and continuing through to Pine St.; I placed $1,200 on lot 5 and $800 on lot 6. They are all 40 foot lots, fronting Canda St.

In block 3, I valued lot 1 at $1,000, lot 2 at $900, lot 3 at $900, lot 4 at $800, and lot 5 at $800. The lots are 40 by 120 feet, for all the lots fronting on Canda St., as far as Pine St., which is the next street west of Main.

The highest frontage price I fixed in Ishpeming was $200 a foot, on lot 75 of the original plat on the corner of Front and Main Sts. I fixed lot 81 at $175, lot 82 at $125, and lot 76 at $150 per front foot.

As to my valuation on lots on the south side of the railroad lands at Negaunee, I did not know exactly where the railroad line was, so I made an average valuation of $300 per entire lot, treating the lots where the road runs through and the lots adjoining those the same.

1122 I did not try to find where the railroad line actually was or how much of the lots the railroad used, and where there was a very small corner outside the right of way, as in lot 105, I did not intend to apply the $300 value there.

On April 25, 1914.

DAVIS recalled.

Further direct examination.

By Mr. Wykes:

In addition to those which I gave before, I have taken from the field notes of the Tax Commission certain of the average values fixed for assessment from the Alger County line to the east limits of the city of Marquette, through Marquette county, and have set them down in a table.

(Mr. Eldredge objects to the testimony because it has no tendency to show the value of the lands, is not competent, and because it allows no opportunity to show the truth in rebuttal, as it proposes to give averages.)

From the Alger County line to mile post 150, not including any of the additions around Chocolay, the average value per acre was $2.81. These figures were prepared for the tax roll by the State Board of Tax Commissioners in 1913.

From mile post 151 to mile post 151.92, the east limits of the city of Marquette, the average value was $5.32 an acre. I have not included from mile post 150 to mile post 151. That was the plat of Lakewood, which I did not take. I have a copy of the figures from which these averages were computed; that is the assessments and the descriptions by the Tax Commission.

(Witness handed detail figures to Mr. Eldredge for the purpose of cross-examination. Mr. Wykes stated that he has introduced simply the computation of the average, to save putting in each detailed description and each price.)

1123 (Mr. Wykes produced a duly certified copy of the Articles of Consolidation of the companies forming the D. S. S. & A. Ry. Co., which is marked Defts.' Ex. 54; also a duly certified copy of the Articles of Consolidation of the companies forming the M. H. & O. R. R. Co., which is marked Defts.' Ex. 55; also duly certified copies of the following Articles of Consolidation: M. H. & O. R. R. Co., marked Defts.' Ex. 56, Houghton & L'Anse R. R. Co., marked Defts.' Ex. 57, Bay De Noquet & Marquette R. R. Co., marked Defts.' Ex. 58, and M. & O., marked Defts.' Ex. 59. He also produced a duly certified copy of the various contracts and records of the State Board of Control of State Swamp Lands, which is marked Defts.' Ex. 60.)

1124 On March 26, 1914.

FRED M. TWISS, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live in Lansing; have lived there since 1899. At present, my official title is Chief Examiner of the Board of State Tax Commissioners in Michigan; have been such for three or four years. I was the first secretary of the State Board of Tax Commissioners, under the act of 1899, and held the place until Governor Bliss was inaugurated and a partial change took place in the Board. Since then, my duties have been the personal examination of property in the state liable to taxation under the general tax law and the supervision of men engaged in that work, when not actually engaged in making personal inspections. My entire time has been spent in that work. I have no other employment.

I have valued property in many counties and cities (naming nine cities of the state in which he worked). In these, I personally examined and valued properties for purposes of assessment or state equalization, and have superintended and examined the work of our field men in other districts. At present, I am in charge of the Tax Commission force engaged in ascertaining the value of Wayne County, including Detroit, for state equalization purposes. Since my first connection with the Board, I think the tendency of assessed values has been upward. Within the last year or two, the purpose has been to put property in the rolls at cash value.

The work in Marquette was as described by Mr. Horton. I was there while the active field work was being carried on—six weeks, altogether. Several years previous to that, I examined property there. I made an examination of South Shore, at Marquette, with special attention to valuing it, three years ago, I would say; it might have been early in 1912. Outside of the cities in which we re-
assessed property, I have a general knowledge of Upper Penin-
1125 sula land along the South Shore, and I think of all rural lands in the Upper Peninsula.

Referring to Complt.'s Ex. 1*b*, Riggs, I cannot place value on description 3 from personal inspection. Description 6, I value *as* $200 per lot. In description 8, I would value the lots at $100 per lot; in description 9, $100 per acre to cemetery and $25 per acre from there to city limits. In description 11, $9 per foot on Lake St.; in description 12, lots 41, 42, 43 and 44 at $250 each; lot 1, east half of lot 31 and lot 32 at $250 each; and lots 69 to 74 inclusive at $200 each.

I consider lots 41, 42, 43, 44, 1, east half of 31, and 32, facing on Genesee street, worth $50 per lot more than those facing on Mesnard St.

In description 13, I place $15 per foot for frontage on Lake St.,

and add $500 for the land in the rear—200 feet from Lake St. and facing Jackson St. In description 15, I value the corner of Baraga and Front Sts. at $90 per foot on Front St.; in description 16, $15 per front foot; in description 17, $30 per front foot, as average value; in description 18, $20 per front foot, on average; in description 24, $150 per front foot on east and west side of Front St., north of Main—the part on west side of Front St., south of Main, appears in a later description; $125 per front foot on east side of Front St. south of Main.

In description 26, on east side of Front St. immediately south of Main St.; I valued at $125 per front foot. In description 27, I made two computations. Assuming that the street was there, available for use, that the company had full possession of it and could dispose of it in fee, my valuation is $59,500; assuming that the plat is available for use only from Front St. and Third St., I placed a valuation of $42,840. If it is to be used from the two ends, without access from Main St. to middle lots, my value is $42,840. If Main St. can be put through and used as a street, I have assumed
1126 the depth of the lots on Front and Third Sts. as 124 feet, and have divided the part facing Main St. between those measurements into lots and valued them per front foot in reaching my $59,500 plus valuation. That valuation covers description 28, also; it would involve the use of that as a street, and render it impossible to use it for any other purposes.

I valued description 29 at $5,850; that does not include the cut 127 feet deep by 38 feet on Front St., which I valued at $150 per foot; I considered that as a lot, and included it in my valuation. I valued description 30 at $19,400, description 31, at $7,200, and description 32 at $18,000. I would not price lots in an unplatted tract without streets as high as individual lots after the tract was platted and was being sold, nor would a purchaser pay as much for lots in such tract as for such individual lots, in my judgment.

In description 33, I would place an average value of $50 per lot on that 7.15 acres, for platting purposes, lots 50 by 125 feet. From that point west, on the 5.74 acres, the values would diminish, in my judgment. In description 34, I would value the 72 acres at $100 per acre. I think I understand the location correctly; it is the right of way through the Harlow property.

I would value description 35 at $100 per acre; in description 36, through the West End plat at $100 per acre; on section 15 at $30 per acre; on section 10 at $50 per acre; on lots 3 and 5, section 11, at $100 per acre; on sections 2 and 11 at $160 per acre. These values are exclusive of any structures on the land, and are based on value of adjacent and nearby property, and also on business conditions in Marquette city, and probabilities of growth in different parts of the town, and the use to which I thought this property might be put. I made independent investigation as to land values in Marquette.

1127 I visited the properties I have testified to, and investigated sources of information, as rentals, etc., with regard to value. My knowledge of rents came from Mr. Horton and the employees

who had preceded me in making the investigation. I consulted with them, in the way of looking over their notes, and then I went around and visited the railroad and other properties, enough of them in the vicinity so I could judge whether my men were fairly doing their work or not; so I would be competent to judge of land values.

Twiss.

Cross-examination.

By Mr. Eldredge:

The prices I fixed on lands valued are not the same as those placed by Mr. Horton yesterday; they differ on the frontage on Lake St. and Front St., on the value of the passenger depot grounds, and of the land between Fourth and Fifth Sts. I don't recall other places now.

My value on item 24 is $150 per foot on each side of Front St. north of Main; that is not the same value I placed in my assessment on north property, but it is on south property, to Main St., I think.

In arriving at $59,500 value for depot property on Front St., I placed $150 per front foot. In valuing the parcel at $42,840, I valued entirely from values on Front and Third Sts. I valued the Front St. frontage in that computation at $210 per foot, 153 feet, and extending back half way across the block, 287 feet deep; on remainder of the block, which I valued as fronting on Third St., 153 by 287 feet, I placed a value of $70 per front foot, which made a total of $42,840.

In arriving at my $59,500 valuation, I assumed that the company had fee simple rights in Jackson cut, and took 183 feet front-
1128 age on Front St. extending back 127 feet, at $150 per front foot, 183 feet Third St. frontage at $40 per foot, and 326 feet fronting on Main, with depth of 183 feet, at $62.50 per front foot, making a total of $59,465, and I called it $59,500. The only difference between Mr. Horton and myself on that valuation was that I put $62.50 and he put $45 on the Main St. frontage under this second method of computing the value.

Under this second method the 183 feet frontage on Front St. would include the Jackson cut. I assumed that Main St. frontage was to be utilized for business purposes. I would face buildings on Front St. so that it came to the north side of the cut; I assumed that 30 foot street was a part of the property—the 30 feet north of the cut. Main St. is not used by the public as much as Front St.; it is 36 feet wide, outside of the Jackson cut. My computation included the facing of the Main St. lots on that 36 foot street; that was the most valuable use of the property I could think of.

I valued the land on the southeast corner of Front and Washington Sts. at $200 per front foot on Front St. for 50 feet; from there farther south, I think to Main St., at $150 per foot. South of Main, it ran from $125 down to $100 a front foot at Baraga Ave., as I remember.

I valued the southwest corner of Front and Washington at $200

per front foot on Front St., for 50 feet. I valued the Jopling lot, about 50 feet front on north side of Washington St., at $8,000, when I knew it had just been sold for $9,000, at about $160 a foot. I put the northwest corner of Front and Washington at $200 per front foot, for 50 feet I would say. I don't remember what I put the next lot at; the record and field notes don't show; they don't show the land and buildings separately. The ownership of this particular corner is all in one individual, or one ownership,
1129 and the value of that block was put in as a whole. Mr. Horton and I agreed, after gaining what information we could from people we thought competent, that these corners should be valued at $200 per front foot. I think I carried that valuation 50 feet each way, but am unable to tell how it was graded down from there. I think lots 5 and 6 belong to the Harlow estate, one ownership, as I remember. I can tell the total assessment of land and building on any lot.

In my judgment the property on Washington St., west of Front St., for about one-half or two-thirds of the first block after you get away from the corner lots, that is, to the west side of lot 8 inclusive on the north side of the street, and to the east side of lot 2 inclusive on the south side of the street, is more valuable than property on Front St. I think there should be a break in value for lot 7 on the north side. I know the property purchased by the Elks; it is lot 2, except east 25 feet, and east three feet of lot 3, 41½ feet.

Mr. Wykes: We treated it as 38½ feet when Mr. Horton was on the stand.

I think the assessment amounted to $125 per foot. I was the party who made recommendations to the Commissioners in cases of doubt; I did not assess the property, but had charge of work there. The Commissioners were in Marquette and viewed many properties there before the conclusion of the review. They prepared their valuation rolls as presented in these field books, what we recommended, but made some examination there before the tentative figures were decided upon.

I made such examination of residence property as in my judgment qualified me to pass value on it. I do not claim to have seen all of the property in the city, but paid particular attention to parts of it.

1130 I visited, with Mr. Horton, every plat in the city, but not every house. I could not recall block 12 of John Burt's Add. without looking at my notes; between Third and Front Sts., the south side of Washington St. is the more valuable. On the left hand column of the left hand page of the field books are the figures for real estate put on the rolls by the Commissioners.

The Tax Commission's assessed valuation of lot 3 of block 12 is $4,800; I only have my notes; there is no other record of that roll. We have no roll; our work is carried out on these field books, which are copied from the assessment rolls; then, when the review is held, the figures that the Commission depends upon for valuations are placed in a column provided for that purpose in the local assessment roll. There is no other roll except the local assessment roll.

As to the $3,500 assessment by the Commission on lot 9 of block 2 of John Burt's Add., the figures on the field book, checked off with a blue pencil, would indicate that that was the figure placed on the property. That is the only way I have of knowing that that is so. I did not attend the hearing at Marquette. Those notes made by one of the examiners indicate the owner paid $1,275 for the lot and $3,000 for the house, and that it would be a low valuation at $4,000, one of the verified sales. The Commission placed a value of $3,500 on it.

The east 75 feet of lot 6 of block 4 of John Burt's Add. was assessed at $6,000 by the Commission; the notes given to the Commission show it was a two-story brick building, occupied by the owner, and that he says he would not sell for less than $10,000; worth about $8,000; he has been offered $10,000; also a question mark in next column after the $6,000, and the word "woman" to the right of it, indicating to me that she was a lady whom the Commission did not think able to pay taxes on full amount of property, and gave it
1131 some consideration. I think the statute on exemptions can be construed to give any assessing officer the power to exempt any portion of the value of a piece of property that they choose. It is sometimes done. The Commission follows, largely, the action of the local assessing officers, who are familiar with the facts, and we very seldom disturb their action with regard to exemption, so long as we maintain the relative proportion between properties. (Sec. 3830, subdivision 7, Compiled Laws of 1897, set out in part.)

I think I remember lots 1 and 2 of block 5 of John Burt's Add., known as the Hargrave Flats. This property was assessed at $40,000 by State Board of Assessors, and the notes submitted by the men who originally looked over the property show it was a two story stucco flat consisting of 13 apartments of five rooms and both each, and that it was worth $42,000.

Lot 9 of block 5 was assessed at $3,900 by Tax Commission; I assume those figures are correct. In the judgment of the men who took the field notes reported to the Commission, the property was worth $4,500; it was not the judgment of Mr. Horton and myself. I cannot tell who took the notes. I remember Mr. Horton and I visited those, and where there were any changes made, unless something there indicates that the Commission changed them, they were the figures we recommended after examining the property. I won't say that either or both of us were always there. Sometimes the notes show changes made on review; sometimes they don't. Sometimes the original figures recommended by examiners are erased and Board figures written over them. I do not know who the examiner was here.

Lot 14 of block 5 of John Burt's Add. appears to be assessed at $3,000 by the State Board; the examiner reported it worth $3,500. I cannot recollect that particular property, and no one would
1132 know whether I visited it or not. The notes on that class of property were made by one of the examiners and afterwards examined by the man in charge of the work, either Mr. Horton or myself, or both of us, and all changes outside of those made at Board of Review, from testimony there, were made either by both of us or

Mr. Horton himself. There would be no way of telling definitely how any change came to be made, unless it might be property of which he had specific recollection. We look at so many pieces of residences that it is difficult to carry them in mind, unless some particular thing causes us to remember. We remember business property better than residence property after a space of time, because it constitutes a much smaller percentage of property in any community. I would say this particular reduction was made on the recommendation either of Mr. Horton or myself, so far as I can see the record in the field book.

I cannot tell who made notes on lot 13 of block 6 of John Burt's Add.; it was assessed at $2,500 by the Board, as shown by that book, and the examiner reported it worth $3,000. Some change has been made in that item since it was originally put in there, in the column from which the assessments were put on the roll; I don't know whether that was made by the examiner or by the Board of Review. The records showing the assessment roll will indicate the figures placed by the Board; they do not indicate the figures recommended by the examiners. The figures shown in the column immediately following the description in these notes indicate dollars. As to the two figures opposite each description, I am confused as to their order; Mr. Horton can tell about that, better than I.

In my judgment, residence property in John Burt's Add., has increased some in value in recent years. I think I covered a period of about 10 years in talking with different real estate men there. I think the values I placed in Marquette were true cash values,
1133 conservatively so, that is, those that went on the assessment roll. If there was doubt as to value, I gave it to the owner of the property. In each case where my judgment was called upon, I arrived at a conservative cash value; not a price that might be received for property by waiting eight or ten years, or one at which a man could sell at once.

I endeavored to put all property at its conservative true cash value, and I think I did.

TWISS.

Redirect examination.

By Mr. Wykes:

John Burt's Add., appears on Defts.' Ex. 6*a*, and is four blocks from station. I don't know how many descriptions there are in Marquette; it would run into the thousands, I think. I was not present at the time of the review.

In fixing my assessments upon the real property in Marquette, and in the work looking to final values placed by Tax Commission, I used my best judgment. If there was any doubt as to value in the cases I have stated, I placed the valuation favorable to the railroad company in such cases; that is, if there was a doubt as to whether it should be high or low, I believe I placed the high amount. I resolved the doubt the other way, where I assessed for taxation purposes.

1134 On March 28, 1914.

A. B. HUBBARD, a witness called by defendant.

Direct examination.

By Mr. Wykes:

I am one of the field men of the Tax Commission; I have been employed in that capacity four or five years. During that time, I have been in the office, now and then, for a short time, but on the field practically all the while. The field work has not been confined to placing valuations; I have gathered data for the State Tax Commission, for purposes of valuation, equalization, etc.

I have worked in placing values in Gogebic, Dickinson, Iron and Marquette counties in the Upper Peninsula, and in Van Buren, Clare and Charlevoix counties in the Lower Peninsula; perhaps in some others I do not now recall.

In Marquette County, I worked in Marquette, Ishpeming and Negaunee; I placed values on the Excelsior Iron Mining Company's plat, Nebraska Hill location, and several others, in Ishpeming, and on the Jackson Iron Mining Company's plat, the principal one near the railroads, in Negaunee.

In order to acquaint myself with values, I interviewed real estate men, bankers, etc., and gathered all the knowledge I could, investigated the sales, offers and bids, where I could find them.

The Jackson Iron Mining Company's plat in Negaunee adjoins the South Shore; it lies on both sides of the south line, I think.

It was my purpose, and I carried it out as fully as possible, to place the actual cash value on property for which I fixed values.

1135 HUBBARD.

Cross-examination.

By Mr. Eldredge:

I did not conceal the purpose of my visit to Negaunee or Ishpeming. I don't know that they knew what I was there for, but I never misrepresented my purpose when asked about it. The people I interviewed knew what my purpose was—the bankers and real estate men.

I think there were quite a number of transfers in the Jackson Iron Company's Add.; that is, within the last two years. They were placed on the field book, and I used them after they were placed there. I presume I was at Negaunee about six weeks, solidly. I was called away, at intervals, to different places, at Marquette and Ishpeming.

HUBBARD.

Redirect examination.

By Mr. Wykes:

I was not attempting to fix the value of any mineral, or anything of that kind—just surface values. In talking with people about the amount to be put on their own property, in using the figures they gave me, I always took into consideration the tendency to under-state values given to a man assessing property. I never, as a rule, fixed the value of a man's property at the price he said I should, but I took it into consideration, always using my own judgment.

1136 On April 14, 1914.

CHARLES M. WHITESIDE, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I am sixty years old, and have lived at St. Ignace ten years. Before that, I lived two years near Brevort Lake, which is 15 miles from St. Ignace and 3½ miles west of Allenville. My business in Mackinaw County has been surveying, land looking, and dealing in lands and timber. I was County Surveyor for two years, after 1904.

I have bought and sold lands in the western part of the county, northwest of St. Ignace, and am familiar with land values in St. Ignace and along the railroad outside. I know the lands of the South Shore at St. Ignace.

At St. Ignace the 1.36 acres which lies between High and Spring Sts., and is a part of description 3, would be worth $50 or $60, if the track was taken up and it was in shape to be utilized. My value is based on sales in the vicinity.

The triangular parcel of .63 of an acre in description 3 could hardly be sold at all in that shape. If it was square or rectangular, it might bring $8 or $10 a front foot on Spring St. There would be about three lots in that parcel.

Acreage property in St. Ignace is pretty cheap. Considerable has changed hands inside the city limits for from $1.50 to $6 or $7 an acre. The city limits extend out quite a long way.

The triangle on State St. at the south and east end of description 7, is too small to be good for much—big enough for a popcorn stand or something of that kind. If it had one hundred foot depth, it probably would be worth $20 or $25 a front foot, but it is worth considerably less than that in its present shape.

1137 The remainder of description 7, which is 3,170 feet of right of way about thirty feet wide, and colored green on Complt.'s Ex. 4*a*, is worth about $1 a lineal foot, for the bare land. There have been sales along description 7, some for more and some for less than the price I have named, as some of the land was improved. The un-

improved land there sold lately for rather less than my price. A lot on Goodrow Alley sold recently, but I don't know the price.

I base my judgment of the value of this land upon a general knowledge of the sales that have taken place there since I have been in the town. Not very much property has changed hands there, and everybody usually knows all about a sale.

The .72 of an acre on State St., which is directly opposite the coal and lumber dock, and crossed by the dock track, would be worth more than it is if it wasn't cut across by the track. In its present shape, $20 a front foot on State St. would be a big price for the whole tract. A three-story hotel on about 130 feet front adjoining, including going business, good will, and all, sold for $6,500.

The next property adjoining that, with about the same frontage, but not so deep, with a two-story hotel on it, and as a going business, sold for about $4,000, not long ago. If you deduct for the buildings and the good will, there would not be much left for the land.

You might be able to get $40 or $50 a foot for a lot off the corner next to that .72 of an acre, but the balance would be practically unsalable at any price, as it is a little three-cornered place, not big enough for anything. It has only a little front, and no other way of getting to it. I see it every time I am down town. The right of way across it is fenced in, about 18 feet wide, and it is also
1138 fenced off from the street. There are no structures on the balance of it, and it is used only for ornamental purposes.

Parcel 8, which is 49.81 acres, and takes in the gravel pit and part of the yard, and runs out to mile post 2, would not bring $10 an acre for any other purpose than railroad use, in its present condition, although the gravel pit has been worth considerable to the railroad. Land very near it, if not adjoining, was recently acquired by the State for taxes, and sold at public sale. That is inside the city limits of St. Ignace, and brought considerable less than $10 an acre at the sale.

The lands on the other side, to the east, are improved quite a bit, and have residences. The unimproved land there has been platted at some time, and lots have been sold for from $10 to $150. They have brought less, of late years, than they did 25 or 30 years ago. I had general information of such sales. People who own land there want high prices. They are "land misers" and want to hold it.

I am more or less familiar with the water front property at St. Ignace. For two years, I have had some for sale on claim 6, between State St. and the lake. There is about 200 feet on the lake, and about the same on State St. It lies a short distance north of Bertrand St. The entire piece has been for sale for $600. It is about 200 feet square.

We have considerable water front at St. Ignace. The price depends on how badly you want the particular location—what you are going to use it for—but quite a bit of our water front has been sold for taxes in the last few years.

Some water front between State St. and the lake, and about 80 rods north of South Shore water front, was offered for sale for taxes, but was not redeemed. I don't remember the amount of taxes.

1139 I should say that $5 a front foot would be a liberal price for South Shore water front, unless it was wanted for some specific purpose and no other location would answer it. There are three miles, or better, of water front in St. Ignace.

On description 7, which I valued at $1 per lineal foot for 3,170 feet, I based my judgment upon its location and the property adjoining, some of which can be bought for less, and some of which is worth more, where there is room to do something with it.

St. Ignace property moves slowly—not more than six sales there the last year. For the last ten years, sales have not been very frequent.

WHITESIDE.

Cross-examination.

By Mr. Eldredge:

I said that my knowldege of sales in St. Ignace was hearsay. The lot that the purser bought was the second from the corner, facing Spring, near Chambers St.

If the railroad were taken off of this .72 of an acre, it would be worth about $20 a front foot. Goodrow Alley is one of the principal thoroughfares of the city.

The lot which I said was recently sold was 50 by 100, and is the second from the railroad track, towards the Straits, on Complt.'s Ex. 4*a*, Riggs. That sale was over a year ago. One of the hotel properties—the Dunham House—sold last fall; the other within two years.

1140 WHITESIDE.

Redirect examination.

By Mr. Wykes:

I have sold 2,000 or 3,000 acres altogether. Besides buying and selling, I do surveying, land looking and timber estimating, principally in Mackinaw County.

1141 On April 14, 1914.

JOSEPH L. MCCHESKEY, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have lived at St. Ignace seven years. I am superintendent of the yards of the Warner-Newton Lumber Co., and am City Assessor, appointed about two months ago. I have investigated the value of city property for the purpose of fixing my assessments. I have attempted to arrive at the cash value, and have covered the part of the city in which South Shore right of way is located. I am familiar with the value of the land between Catherine and Graham Sts.

The owner of the Dunham House property held it for three years at $5,000, and tried to sell it. It had a two-story hotel, and about 130 feet frontage on State St. The lot on Goodrow Alley, mentioned by Mr. Whiteside, was sold by the Fairs for $500. It was on the north side of Goodrow Alley, and had a house, which could not be built for what it was sold for.

The frontage on State St. adjacent to the location of the green triangle, at the end of parcel 7, would be worth about $200 for a lot 50 to 66 feet wide, if the lot were vacant. I intended to leave the assessed value of this property at the same figures at which it now stands, as I don't think we can raise it, the way things are moving in real estate.

Any lot anywhere in the city along State St. would be worth $200, outside of the two hotels, which have good big buildings. I am assessing them at that figure, where unimproved, and I am assessing at actual value.

The .72 of an acre on State St., opposite the coal and lumber dock, would not be worth over $5 to $7 a front foot, if you were liberal, considering the value of property in St. Ignace.

1142 Unimproved lots near the Humphrey or South Shore lots sell for $50 to $125. I was offered any lot there for those prices last spring by McNamara, who holds that property. I think they are 50 to 66 feet front. I have bought only a house and lot in the residence part of the city, and have sold none.

1143 On April 14, 1914.

WILLIAM M. SNELL, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have lived in Sault Ste. Marie for 26 years; have been County Clerk four years, and Probate Judge 12 years. Since Jan. 1, 1913, I have been practicing law, and handling real estate and loans. Since 1895, I have dealt more or less in real estate, and now own property in Sault Ste. Marie. I own a half interest in the Gilmore G. Scranton Add., in the suburbs, and have an equity in the McGregor Add., which I purchased under contract. The latter is in the southeastern part of the city. I own various other lots, some purchased recently.

In the last year or two, I sold 28 lots in blocks 2 and 3 of Scranton and Robertson's Add. for $150 a lot, or $4,000 net. That was a low sale. I hold for sale that part of private land claim 4, south of Ridge and Spruce Sts., about 2½ acres, for $6,000. That is 208.6 feet on Spruce, 232 feet on Ridge, and 520 feet from street to street. It has been on the market for that price for two or three years, but I haven't been able to sell it.

I am agent for the Foss and Hyde property, which is right south of the Northwestern Leather Co.'s plant and near the Scranton Add. It is platted into lots, three of which I sold four or five years ago for

$150 each. That was the high water price, and we have been forced to revise our prices since then, as there is no demand. I have only sold about eight lots there in five years; the others were sold from $75 to $125 each. There are still about 100 lots unsold. The G. G. Scranton Add. has been on the market since 1901 or 1902. For about two years, we did quite a brisk business, selling a couple of lots a month, for $175 to $250 each, on the installment plan. Then the demand dropped away, and the sales have been very few and far between. I got $250 for the last lot that I sold, as it was a nice corner lot. The inside lots have sold from $175 to $200,
1144 easy terms. I discounted some of the contracts, to get them to carry them out. I sold lots 3 and 5 of block 2 of Scranton's Add. for $75 each. They were 40 by 125 feet. I have sold no lots in the South Shore or Foss and Hyde's First Additions. There seems to be no demand.

Algonquin, south to city limits. For a short distance immediately southwest of the curve, right at Algonquin, there is some fairly good territory which might be worth $150 an acre, possibly more. The Algonquin Add. is in there, and has some very nice lots and houses, while on the west side of the track there is Beadle's Add. Not considering that locality, I should say the strip from Algonquin to city limits would have an average value of $50 an acre. The further out, the lower the value, possibly $15 or $20 at the city limits. I would put $150 on the land from Algonquin to the west side of Hall's Add on the N. E. of the S. W. of 11.

The S. W. of the N. E. of 11 would be worth more, say $600 an acre, counting the lots at $100 each. At that price, there would be no immediate sale, but you would have to hold them for a number of years.

Description 8 on Complt.'s Ex. 3*a*, which contains 9.57 acres, is worth $500 an acre. That is a liberal price, and just exactly what I paid for this land now platted into Scranton's Add. The situation was even more favorable then than at the present time.

Description 7, 17.45 acres, and being divided into four parcels, is worth $350 to $400 an acre. That part of description 6 on Complt.'s Ex. 3*a* is the S. E. of the S. W. of 1; it is worth $250 per acre; that part east of the east line of that description, and west of 6th St., is worth $300 to $350 per acre. Descriptions 5 and 10 on
1145 Complt.'s Ex. 3*a*, and not including any water or riparian rights, is worth $500 to $600 an acre for sub-division. These values are based on sale of adjacent land.

Description 11, immediately south and adjacent to description 6, is worth about the same as 6. Descriptions 12 and 13 I would value a little lower than 6 and 7, because the latter are nearer water front.

The Union Station property immediately north of Private Land Claim 4 is a little more valuable than Private Land Claim 4, as it is the frontage facing the canal. When the station was located at its present location, land values in the Soo were greater than at present. Locating the station there stimulated values adjacent for a while. Although we have had a great slump in real estate values throughout the city, the value close to the station is greater today than when

they made the change. Property along Magazine St. has been greatly enhanced in value—some is worth two or three times as much.

Three or four lots in Emaline Wood's Add. sold for $500, for the bunch. I was offered two lots in Scranton & Robertson's Add., block 3, on Spruce St., for $125 apiece, but refused, because I was loaded. I think they were cheap at that. If you can buy the S. E. of the N. E. of 13 for $10 an acre, it is a good buy.

The corner opposite the new station was enhanced in value by locating the station there, possibly three times, and all property on Portage Ave., between Magazine and Ashum, was thus enhanced, as were lots in Emaline Wood's and Scranton & Robertson's Additions.

1146 SNELL.

Cross-examination.

By Mr. Eldredge:

I would value the land from Algonquin southwesterly to Hall's Add., which is N. E. of S. W. of section 11-47-1 west, at $150 to $200. Only certain portions of S. W. of N. E. are worth $600 an acre. Taking it as a whole, I wouldn't think that Hall's Add. was worth more than $100 an acre; possibly those blocks immediately adjacent to the road might be $150 an acre. From that point to the corner of section 15, the value is $50 an acre. From that point to the city limits, the average would be $15 an acre.

I sold the 28 lots in Scranton and Robertson's Add. for $4,200, and waived my commission, making them $4,000 net. I am now agent for the purchaser, and they are held at higher prices—$10 a front foot on any street on which they front. They run from 25 to 40 feet in width.

The railroad property southwest of the canal as far as Sixth St., I valued at $500 to $600 per acre. From Sixth St. west to the north and south quarter line of the section, I valued it at $350 per acre. The land in there adjacent to the water front is worth about 25% more than that farther away, but my average is $350 an acre.

From this quarter line to the next quarter line, my value was $250, and from there to Algonquin I again divided it, putting $350 on it to the next quarter line, and from the section line to Algonquin $500 an acre.

1147 On April 15, 1914.

CHAS. E. CHIPLEY, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I am thirty years old, and have lived 20 years in Sault Ste. Marie; all the time in real estate business, being now connected with Moffly

& Chipley. We conduct a business on both sides of the Soo. I have been in the general real estate business, making deals all over the city, and have purchased land for myself, and as agent.

We now have lands listed for sale by ourselves and others, and I am familiar with land values in the American Soo, and the right of way of South Shore from the tannery down, and know its value. The tannery is at Algonquin, on the lower part of section 11.

Within the last few years (April, 1913), I sold the parcel of land marked American Brick Co. on Complt.'s Ex. 3*a*, Riggs. It is a part of Private Claim 1, and contains 13.21 acres, all upland, and between 1,000 and 1,400 feet of shore front. It lies immediately across the highway, north from the railroad lands. The consideration was $10,000 for upland, water rights and all.

We have number 225 Magazine St., which is just south of Emaline St. extended east, for sale at $1,500. The lot is 35 by 225, and there is a store building on it easily worth $1,000. In June, 1912, I sold a lot 35 by 150, with buildings worth $1,000, for $1,250.

Lot 4, block 4, Emaline Wood's Add., 50 by 110, with two buildings, worth $500, sold in May, 1912, for $800. Lot 8, block 3, Scranton and Robertson's Add. 35.7 by 105 feet, a vacant lot, sold in April, 1913, for $357. The north half of lot 9 and all of lots 10, 11, 12, 13, 14, 15 and 16, block 2, sold in March, 1912, for $1,500. They were 35.7 by 105 feet. We tried, the other day, to sell lots
1148 17 and 18 of block 3 of Scranton & Robertson's Add. for $125 apiece; they are 25.7 by 105.

From Fourth Ave. extended, to center line of section 12, the land is worth $200 an acre. From center line of section 12, to south bank of water power canal, is worth about $400 an acre. I took the South Shore Add. as a basis. From north bank of water power canal, to west line of Grand Trempes Ave., is worth $1,500 an acre. From west line of Grand Trempes Ave. to east line of Magazine St., is worth $3,500 an acre.

We have the Iroquois Hotel site, with 143 feet on Portage Ave. and 416 feet depth, besides another parcel, 45 by 103 feet, making a total of about 64,000 feet, or an acre and a half. That is for sale for $8,000, and has been for two years, on easy terms.

We also have listed Private Land Claim 73, which is north of Portage Ave., just west of Ashmun St.

I am generally familiar with the South Shore lands as indicated on Complt.'s Ex. 3*a*, Riggs, and the values I have stated would apply to the full width.

CHIPLEY.

Cross-examination.

By Mr. Eldredge:

The 13 acre tract on the river, sold by Perry, was on the market three years at the sale price. Lot 4, block 4, of E. Wood's Add., which sold for $800, was bringing $15 a month income when sold,

in May, 1912; $800 was cheap for it. We can't sell unless we think property is worth more than we sell it for. In my judgment, its present value is $1,000 to $1,200.

1149 The 7½ lots which I mentioned sold for $1,500 net in March, 1912. The buyer, Mr. Olds, got about $1,700 for them, from the Pintsch Compressing Co.

From the line between sections 12 and 1 to the south line of the canal, I valued the land at $400 an acre, but wouldn't buy it at that and plat it.

From the tannery to the line between sections 12 and 1, I valued the South Shore land at $200 an acre. In arriving at these figures, I did not take into consideration the fact that a large tract of land would be thrown on the market, thereby decreasing values, but put a price on it that I thought would be fair under present conditions. My prices represent the speculating value on the present market if the town is improved. This applies on'y to the $200 and $400 valuations. From that point up to the station, the value of the land is more or less fixed by the Scranton & Robertson Add. prices.

CHIPLEY.

Redirect examination.

By Wr. Wykes:

The water front first spoken of as sold for $10,000 was part of a bankrupt estate. I do not know whether it was appraised at that by Stradley, Snell and Davidson, or not. The Soo Savings Bank was interested, and everybody was satisfied at that figure.

The kind of property represented by lot 4, block 4, which sold for $800, would have to bring 20% gross in order to net 7%.

I got the idea that the sales in block 3 of E. Wood's Add. to Mr. Stradley were for the railroad. The property adjoins the railroad land, and that was my personal idea.

1150 On April 15, 1914.

CHARLES RIPLEY, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have lived in Sault Ste. Marie four years. I am on my second term as City Assessor, and am making my third assessment. I have been Supervisor of Sault Ste. Marie township, and have assisted other assessors in making their assessments. I have owned, bought and sold land in the Soo; at one time, I owned Private Land Claim 94, of 19 acres, just the other side of the round house, which I sold to the railroad company in 1887 for $3,500. L. P. Trempes owned the next land claim, west, at that time. It consisted of 53 acres, originally,

but the shore washed off some of it. That was Land Claim 1, and I understood he sold it to the railroad for $10,000.

Mr. Gager owned 20 acres immediately east of that; the roundhouse now stands there. The railroad paid $3,000 for it, Mr. Trempes said. All three claims took such water front as was adjacent.

Compared with today, the land values in the Soo were high in 1887; that was the year of the boom. I paid $500 for that 19 acres in 1883; it wouldn't be worth $3,500 nor anywhere near that, for any other purpose than the railroad. I think that the sale at $3,500 was at double its true value.

(Objection, by Mr. Eldredge, to testimony as to assessed valuation of property, as having no tendency to show its value.) (Witness produced assessment roll, and testified as follows:)

1151

Section.	Description.	Acres.	Assessed value.	Remarks.
15	W. ½.....	309.53	$4,000	Except right of way.
	N. ½ N. E. ¼.....	71.88	1,000	Except 8.12 acres right of way.
	S. W. ¼ of N. E. ¼	33.45	400	Except 6.55 acres right of way.
	S. E. ¼ N. E. ¼...	40.	400	Except right of way.
10	E. ½ of N. E. ¼ of S. E. ¼.	20.	800	Exempt. Owned by Chippewa Co.

	W. ½ S. E. ¼.....	80.	2,000	
	S. E. ¼ S. E. ¼...	37.7	1,400	Except right of way.
11	S. E. ¼ S. W. ¼...	40.	1,600	
	S. W. ¼ S. W. ¼...	33.9	1,400	Except right of way.
	N. W. ¼ S. W. ¼...	37.19	1,700	Exempt. Owned by Chippewa Co.
	N. E. ¼ S. W. ¼...	Lots in Hall's Add.	10 ea.	
	Lot 3 N. E. ¼ N. W. ¼.	19.65	6,000	Has water front.
	S. E. ¼ N. W. ¼ N. of R.	35.15	4,000	Has buildings.
	S. W. ¼ N. W. ¼..	Lots in Bendel's Add.	20 ea.	Ten lots to acre.
	S. W. ¼ N. E. ¼ N. of R.	4.5	600	
	S. W. ¼ N. E. ¼...	21.	3,000	Except R. R. & part of Algonquin.
12	N. W. ¼ N. W. ¼..	12.40	2,000	Exempt. Owned by Soo Line.
	W. ½ N. E. ¼.....	80.	6,000	
	N. E. ¼ N. W. ¼..	21.5	1,600	Except right of way & Chandler's Add.
	N. E. ¼ N. W. ¼..	.27	50	Except right of way & Chandler's Add.

1152 Scranton & Robertson Addition.

Block.	Lots.	Assessed value.	Remarks.
1	19 and 20.....	$200 both	
	29 and 30.....	500 "	Small exception Standard Oil structure.
2	1 and 2.....	400 "	
	3, 4, 5, 6 and 7.....	800 all	
	8 and E. ½ of 9.....	300 "	
	W. ½ of 9 and all 1016 inclusive	1,800 "	Pintsch structure.
	17	200	
	18-24 inclusive.....	1,200 all	
	25-32	800 "	
3	1 to 7.....	700 "	
	8	300	
	9 to 16 inclusive.....	800 all	
	19 and 20.....	200 both	
	25, 26 and 27.....	300 all	
	34	100	
	35	600	Structure.
	36	400	House.
	37 and 38.....	200	Vacant.

In making these assessments, I have tried not to get anything less than 75% of cash value. I think a good many of them will run up to the full cash value—what they are worth today. I know of several that have sold for less than I have assessed them; lot 3 in section 11 sold for just what it is assessed for.

RIPLEY.

Cross-examination.

By Mr. Eldredge:

Since 1896, I have owned only the lot where I live; I have no other business than City Assessor. I previously sailed on the lakes, ran a ferry boat, and was in the mercantile business.

1153 The west half of lot 9, and lots 10 to 16 inclusive, block 2 of Scranton & Robertson's Add., where the Pintsch plant is, are assessed at $1,800. Before the buildings were put there, they were assessed at $1,500. The buildings and permanent fixtures are included in the assessment. They only had one, rather small, brick building at the time I made my assessment, and I put lots, buildings and all at $1,800. In my judgment, the building could be constructed for about $1,000. I treated the tanks as permanent fixtures, and assessed them as part of real estate. I didn't know what they were worth, and didn't ask anybody.

I assessed lot 4, block 4, of E. Wood's Add., at $1,000, and lots 17 and 18, block 3, Scranton & Robertson's Add., at $1,000. The Board of Review cut the latter assessment to $500 for the two lots. They had a dilapidated building, and were formerly assessed at $2,000, which I cut in two. The building had not been burned when the Board cut the assessment to $500.

In the South Shore Add., lot 4, block 1, is assessed at $250; lots 9 and 10, block 2, at $150 for both.

In Chandler's Third Add., lot 7, block 1, is assessed at $800. Lot 4, block 2, is assessed at $400; lot 2, block 2, same addition, at $50; I think there is a building on lot 4. I think there is a house on lot 7, block 1, from the assessment. The vacant lots in Chandler's Add. are assessed at about $50 a lot.

The vacant lots in the South Shore Add. are assessed at $75 each; some lots are higher, but there may be houses on them. Lots 1 to 18 are carried at $400 in Scranton & Robertson's Add., but they are exempt, and the values are not carried out. Lots 3, 4, 5, 6 and 7, block 2, are vacant, and assessed at $800.

1154 Lots 1 to 7 are vacant, and assessed at $100 each. Lots 18 to 24, block 2, are assessed at $1,200, including a building on one of them. Lots 26 to 32 are vacant, and assessed at $150 a lot. Lots 9 to 16, block 3, have $100 a lot; lots 19 and 20, block 3, same price, and all are vacant. Lots 25, 26, 27 and 34 are vacant, and assessed at $100 each.

In Foss & Hyde's Add., the vacant lots in blocks 1, 2, 3 and 4, are assessed at $50 each. In Foss & Hyde's Second Add., lots in block 1 are assessed at about $50 a lot. In blocks 2, 3, 4 and 5, vacant lots are assessed at $30 each. In blocks 6, 7, 8 and 14, vacant lots are assessed at $20 each.

In G. G. Scranton's Add., vacant lots in block 1 are assessed at $40 block 2, $50, and block 3, $40.

In the Algonquin Add., vacant lots in block 1 vary from $50 to $100, nearly all being $50; in block 2, the vacant lots are assessed at $50 each; in block 3, four lots are assessed at $100, for all four.

RIPLEY.

Redirect examination.

By Mr. Wykes:

In the several additions, many of the same lots are assessed to the same person. I have sailed as a master, and owned part of the ferry line between the American Soo and the Canadian Soo. I have dealt more or less in real estate, while in business.

1155 On April 17, 1914.

RALPH J. MACKENZIE, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I am 32 years old, and live 1½ miles southeast of Eagle Mills, in Negaunee Township, of which this is my second term as Supervisor. I have made one assessment. My business is farming. I have had 15 years' experience as a mining engineer, for the U. S. Government in the Philippines, and for myself in contracting in South Africa,

where I also did consulting and geological work. I have a diploma from Washington, given to me by a special board of examiners. I was born and raised in Negaunee, and have lived in Negaunee Township two years.

I investigated land values for the purpose of my assessment, going over the different lands to find out the value of the timber and the quality of the soil for farming. I think I am a competent judge of the value of lands in Negaunee Township, and am familiar with the land along South Shore there. I can give a description of almost every foot of it. It is mostly sandy and rock bluffs, those Diorite bluffs, which are of an igneous formation that is of no value for anything. There is no soil to speak of, at all.

On sections 24, 25 and 26, the land along South Shore is worth $4 an acre. I placed my valuation here according to what I thought it was worth and what I could buy it for. That is about the best price I could get for it. In section 24, there is only rock and high bluffs along the right of way. To the north, there is a farm, and sandy land. To the south, there is practically all sand, with underbrush and second growth.

In section 34, the land is practically all poor farming land. with sand hills; a good deal of marshy swamp adjoins the railroad,
1156 there; more on the north side. The land through that section is worth $3.25 an acre. As you go south from the railroad, the land is better. I am following the north line, and going west. The next section over the line in the city is 33.

I know the south line of South Shore into Marquette, and can value the land along it. From Eagle Mills down to Morgan Heights Sanitarium, which is about a mile, the land is worth about $4 an acre.

Going further east from Morgan Heights, there are only two or three sections within Negaunee Township. The land in that stretch is probably worth $4 or $5 an acre. It is a little better for farming purposes as you get away from the right of way, and there is a little second growth timber on it.

The values I have given represent the entire value. There are no mines in the township, and nothing of any value, at all, in the line of mining. All the lands I have valued are east of the ore formation.

MacKenzie.

Cross-examination.

By Mr. Eldredge:

It is a little over a mile from Eagle Mills to the west line of Negaunee Township, which is the east line of the city of Negaunee, and the value of the land running through there on the south side of the track is about $4 to $5 an acre; on the north side of the track along the right of way, and that swamp, the land is worth not over $3 or $3.50 an acre, under present conditions.

Within a quarter of a mile on either side of the station at Eagle Mills, the land on the north side of the track is worth about $6 an

acre, being pretty well cleared. On the south side of the
1157 track, it is worth $3 to $3.50 an acre. F. W. Read has a farm, which comes right up to the right of way in that quarter of a mile, which I value at $6 an acre. I value all of this land for its use for farming purposes. I didn't say that the iron ore formation did not extend into the township of Negaunee. According to my experience and knowledge, it runs diagonally through—just catching a small section of the township southeast of Eagle Mills. It doesn't go through the township to Marquette, but extends down through into Sands Township, and to the north side of Goose Lake, in Richmond Township.

I knew they had made explorations on the Harlow farm in Marquette, but didn't know the result. According to my knowledge, I wouldn't say that it runs to Marquette at all.

When exploring they have to have some formation in the vicinity. 90% of the farm at Eagle Mills is clear of stumps and could be cultivated; it is not under cultivation now; different ones have been cutting what hay is practically growing wild there. The adjoining lands around there are practically second growth poplar—underbrush. I value them at $3.50 to $4 an acre, and the cleared lands at $6. I think the land where the underbrush is could be cleared for $10 to $12 an acre.

MACKENZIE.

Redirect examination.

By Mr. Wykes:

That land is medium quality sandy soil. Part of that land would not warrant the expenditure of $12 an acre on it for clearing, and part of it would. There are old pine stumps scattered here and there on that farm which I have said was cleared. There are only a few farms in the township, and most of the farmers have to work in the mines, in order to make a living.

1158 These lands can be bought for the prices I have named. I have considered the land worth, to anyone, the amount for which it can be bought.

MACKENZIE.

Recross-examination.

By Mr. Eldredge:

I have inquired from the Cleveland Cliffs Iron Co., and got the prices on different land there, for myself and others. I never tried to purchase any piece of land that lay along the South Shore, anywhere.

I understand they cut between 17 and 20 tons of hay off of about 100 acres of that land at Eagle Mills, cutting wherever there was enough to warrant it. The hay is not wild but was put under cultivation when F. W. Read was there.

They were experimenting, recently, on three or four acres between

a quarter and a half mile from the track, trying to grow alfalfa. The Read farm has only a few acres on the south side of the track, where the right of way runs through, and that was practically all a sawdust dump. The farm runs from the track, back north, and extends about a quarter of a mile on the north on that side. If that farm was re-plowed and re-seeded, it might raise one-half to one ton of hay an acre, and the general average price of hay is $12 a ton.

They have not been farming there for four or five years. The cost of cultivating, seeding and harvesting the crop brings the cost of hay up to a good deal more than you could buy it for.

I was employed in China, by Jardine-Matthewson of London, and also by the Chinese Government, direct, Yuan Shukai, who
1159 is now President of China being the managing director. My duties were those of a mining engineer. I was in China two years, working for the government about 14 months, and for Jardine-Matthewson and the Pekin Syndicate the balance of the time.

I went to Mr. Townsend, the land agent of the Cleveland Cliffs Co., and asked him what they would take for those lands, and he said about $3.25 to $6 an acre—any of it. I wanted to buy three or four forties near Goose Lake, but he said they were in their timber shed, and were reserved. Then I talked it over with him about some other lands that I have had in view there, that we wanted to purchase for pasture lands and fence in, and he said that any of that land there was from $3.25 to $6 an acre. Those lands are even, adjoining the right of way, from the right of way right back through that flat called the Eagle Mills flat.

MACKENZIE.

Recross-examination.

By Mr. Eldredge:

Mr. Townsend told me this about two months ago. I didn't ask him about any particular acreage, but this price that he gave me was on any of that land through there. I asked him about the lands adjoining South Shore and L. S. & I. rights of way, and all the land in that neighborhood known as the Eagle Mills flat, and down around Morgan Heights, and south towards Goose Lake. He said he would be glad to get rid of it for $3.50 to $6 an acre.

I attended St. John's Military Academy, Delafield, Wis., for two years, being about 18 or 19 years old when I got through. During my vacations and after I finished, I was all over the country, getting practical experience. When about 26 years old, I took certain examinations and got credit at the Houghton School of Mines,
1160 but did not enter. At that time, I had been in the Philippines; had been with the Drummond interests of Montreal, in superintending their exploration work, where I stayed four months.

I was, next, an assistant to the geologist in the Department of the Minister of Mines, in Ontario, where I was six months in exploring and superintending. We did diamond drilling and test pitting for all the metals in the Rainy Lake, Port Arthur and St. Mary districts,

my headquarters being in Toronto. We had six or seven scattered prospects, and I went from one to the other, being in charge. My business was to go from one place to the other, make my reports, locate my holes, and superintend the work.

After that, I was in the Philippines seven months as a coal mining expert, under the War Department. I had previously been in China, where I went in 1904. I went to Ontario in 1907.

The first work I did after I left St. Johns was for George Maas, at Negaunee, where I worked as an assistant on a diamond drill. I next went to the Cleveland Cliffs Co., in Negaunee, where I did the same work. I next went to the Mesabe Range, where I did the same work. I next worked for the Republic Iron and Steel Co., at Negaunee, at diamond drilling, going from there to South Africa for geological work and diamond drill contracting for S. Nuiman and Company of London. I stayed there 22 months, returning in the fall of 1903.

I went to Houghton for those examinations when I was about 26. It was about the time I went to the Philippines.

After I returned from South Africa, in 1903, I went to China, in May, 1904, where I stayed about two years, where I was in
1161 charge of diamond drilling, and a coal mining expert. I did not personally run a drill. I next went to Canada. These different positions were obtained through the Sullivan Machinery Co., of Chicago. The drills used on the work were usually the Sullivan Diamond Drills. In the Philippines, I was coal mining expert, in charge, and acting as consulting engineer in all the work, with no one over me but the War Department. I was there for seven months, and spent about five months in addition for the Government, in Illinois, Michigan, New Hampshire, Pennsylvania, California and Colorado, getting my men and machinery for the work in the Philippines. I also went to Mexico, for the Mazapil Copper Co., doing diamond drilling and consulting work.

That is all my mining engineering experience, except that I have been consulted on geological formations and the prospect for minerals.

1162 On April 17, 1914.

WILLIAM PIERCE, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live at the National Mine, Tilden Township; I have lived in that Township 12 years, and in that vicinity 37 year-. I lived at the Lake Angeline location, south of and near Ishpeming, before I came to Tilden Township. This is my second term as Supervisor, and I have made one assessment.

I know the South Shore line as it runs through that township. It crosses sections 17 and 18-47-27. The lands along the railroad in those two sections are sandy, with no farms; it is mostly covered with undergrowth of poplar and scrub-spruce; there are a few pine stumps remaining.

In my judgment, the land along South Shore through those two sections is worth $3 an acre. I assessed them at $3 an acre, except the northwest quarter of section 18, which I put at $5. Those figures represent my judgment of the cash value of that land, and are my last year's assessment. The Tax Commission raised these values, but I don't remember their figures.

PIERCE.

Cross-examination.

By Mr. Eldredge:

I am a miner, and work at the Iron Mountain Lake Mine, for the Jones & Laughlin Ore Co. That is about three miles from the Lake Angeline property in Ishpeming.

I think the Iron Cliffs Co. owns all the land through there in sections 17 and 18. I never bought or sold any land in Tilden Township, and know of no sales in sections 17 or 18. I valued it principally on the character of the soil.

1163 On April 17, 1914.

CHARLES J. JOHNSON, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live at Diorite, west of Ishpeming, in Ely Township, of which this is my second term as Supervisor. I have made one assessment, and am about to make another. The South Shore runs through sections 13, 14, 15, 16, part of 17, 8 and 7, town 47-28, in that township.

I have been over the land adjacent to the railroad, often, and know its character very well. It has been cut over years back; there is a great deal of second growth on it, and one farm, along the track, called the Low Moor. It is on sections 16 and 9, and belongs to E. C. Anthony, of Negaunee. There are no other farms along the line of the road, except a few small patches at Clarksburg, which is on section 7. I know the value of the land along the line of the road through that township. In my judgment, it is $3 an acre, on the average. That is for the cut-over lands, and all the way through, alongside of the right of way. They are all cut-over lands, except Low Moor farm, which extends about a mile and a half along the track. That farm is now under cultivation. The Tax Commission placed values above mine. In my judgment, the values which it placed are too high.

JOHNSON.

Cross-examination.

By Mr. Eldredge:

I am a surface foreman for the American Boston Mining Co., at Diorite. 16 or 17 years ago, I bought 80 acres in section 10-48-28, which is away from the railroad. That is the only piece of land I have dealt in in Ely Township. I was summoned here as a witness. Before that, a letter was written to me from the Attorney General's office to make a report, which I did not do.

1164 I valued Low Moor farm at $3,200—buildings and all. I don't think that the buildings alone are worth that. I arrived at the valuation by former assessments, a great deal—used my own judgment, combined with the former assessment, which was the same amount. I have no exact idea of the value of the buildings. The land itself is worth about $3 an acre; I don't know the acreage, but it runs about a mile alongside of the railroad track, and is about a quarter of a mile wide in some places and a half mile in others, most of it being perfectly clear. In my judgment, it is no more valuable than the other land along the road, as it is in a big bog, and very seldom can any crops be raised on it. They get mostly marsh hay off of it; that answers for feeding purposes; I have bought it for $6 a ton, delivered.

The soil at Clarksburg is a sandy loam, and capable of cultivation, but it is all cut up into small parcels, 10 acres being the most which can be cultivated. I put that in at $3 an acre, as an average with the rest, and assessed it at $3. The land there that is cleared and can be cultivated lies along the railroad, and is more valuable than the rest. I think it is worth about $3 an acre; I valued it at the same figure, whether it was in one, forty or eighty acre pieces. That covered the land—not the house. I have never valued that separately. I couldn't do that. I have taken them all, as a forty or an eighty, and valued them all at the same figure. There is hardly any cleared there, with the exception of Low Moor farm, and some of those tracts at Clarksburg.

JOHNSON.

Redirect examination.

By Mr. Wykes:

In making my estimate, I put an average value on the forty or the eighty, and did not attempt to separate, in any case, the cleared land from the rest.

1165 On April 17, 1914.

JAMES KENNAUGH, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have lived 2½ years at Humboldt; before that I lived 22 years in Ishpeming. I now have charge of the Barron mine at Humboldt, and have been Supervisor of Humboldt Township for two years, having made two assessments. This is my third term. I am familiar with the right of way of the South Shore through that township, and know the character of the land through which it runs.

The main line goes through sections 1, 2, 3, 4-47-29. I am familiar with the value of the lands along the right of way in that township. I have figured up the value through the four sections, and think the average is between $6 and $7 an acre, on the main line, taking the average value on both sides through the township along South Shore.

In getting at this average, I placed the S. ½ of the S. E. ¼ of section 1 at $5 an acre, the N. ½ of the S. E. ¼ at $5 an acre, the N. ½ of the S. W. ¼ at $9.37 an acre, including mineral possibilities, the S. ½ of the S. W. ¼ at $15 an acre, including mineral possibilities, the N. ½ of the S. E. ¼ of section 2 at $6.50 per acre, the S. E. ¼ of the S. E. ¼ at $17.50, the N. ½ of the S. W. ¼ at $6.50, the S. E. ¼ of the N. W. ¼ at $3.25, and the S. E. ¼ of the N. W. ¼ at $6.50.

The land along the railroad throughout section 3 is swampy. In that section, I valued the S. E. ¼ of the N. E. ¼ at $3.25, the S. W. ¼ of the N. E. ¼ at $3.25, the S. E. ¼ of the N. W. ¼ at $3.25, and the N. ½ and the S. ½ of the S. W. ¼ of the N. W. ¼ at $3.50. I valued the N. ½ of section 4 at $3.40 an acre.

Land along the railroad in section 2 is also swampy. There is no timber on any of this land in these three or four sections.

1166 KENNAUGH.

Cross-examination.

By Mr. Eldredge:

None of the forties named cover the Baron mine. Possibly, in section 1, a small part of the Republic branch, where it leaves the main line, might be included. I have put the property on the assessment roll at the figures named.

I was a miner on section 16, at Ishpeming, before I went to Humboldt. I was elected Supervisor within a year after moving, and at that time had no particular knowledge of the values of lands in Humboldt Township. Since then, I have not dealt particularly in

land there, except adjacent to the Baron mine. In a good many instances, I followed the valuations put on land by my predecessors.

I had some knowledge of values, and made some changes, but none in the land along South Shore. In a conversation I had with you (Eldredge) I said I had no knowledge of a mineral formation along the main line of South Shore or just east of Humboldt. When I valued the mineral possibilities, I did so on the judgment of my predecessors, and not on my own. I had not changed any valuations on mineral land there.

The Baron mine is in section 11-47-29, as is the Republic branch of South Shore. The Baron mine is on the whole N. W. ¼ of section 11, and that 160 acres is valued at $51,000.

The South Shore passes over one forty. The Webber lands are in section 2, and the South Shore passes over two forties, which are valued at $12,000, on account of the presumed mineral values. That valuation was on the property before I came. I don't know what value I placed on the right of way across the Baron
1167 mine in a conversation I had with you; the Baron mine forty is the most valuable that South Shore passes through.

In assessing the lands of mining companies, I did not assess the property on which the mines were located and then have that include the value of the minerals, if any, in other lands that the company owned in the same township. Each piece of land was assessed separately. My valuation on the Baron mine property was $43,000. The State Board of Tax Commissioners raised it to $51,000. As a general rule, they raised my valuations, but not very much, and some they lowered a little. The valuations given by me in answer to Mr. Wykes' questions were my own, and as I originally placed them on the roll.

KENNAUGH.

Redirect examination.

By Mr. Wykes:

The Tax Commission got their values higher than I thought the land was worth—too high in some instances. The Baron mine assessment covers land, minerals and improvements. The Webber description, assessed at $12,000, includes mineral value, and many thousands of tons have been mined there.

The figures I have given represent my own judgment of value. I figured that on the Baron mine property my figures are high enough, and that the State Tax Commission is $8,000 too much.

(Mr. Eldredge takes witness out for a consultation, with a view to making him his witness, and states that it isn't the first time he has consulted with him.)

In my judgment, the value of the right of way of South Shore through the forty acres on which it crosses the Baron mine property

is just what the assessment roll says per acre on the Baron
1168 mine property and on section 2.

In our conference, Mr. Eldredge figured that the land was worth $75 an acre for a right of way over this property. On the sheet which Mr. Eldredge gave me, the $12,000 was divided by 80 acres, and $150 set opposite, as the quotient. He showed me that. There was on that sheet, also, $51,000, which was divided by 160, the quotient being $300, which he also showed me. Those assessments cover the land and the minerals, and the minerals do not belong to South Shore.

KENNAUGH.

Recross-examination.

By Mr. Eldredge:

I consulted with you (Eldredge) about the value of those lands, in your office months ago. When I said that the value of the right of way was $150 an acre, I really meant $75, as I told you in our consultation that the right of way was worth about half the value of the land and its minerals. In the same way, I told you that the value of this right of way across the Baron mine was about half the value of that mine, or about $150. That is the conversation we had, both in your office and in the hall. You simply asked me what I told you in your office.

KENNAUGH.

Redirect examination.

By Mr. Wykes:

I think it was Mr. Eldredge who first suggested taking one half for the mineral and one half for the right of way.

1169 KENNAUGH.

Recross-examination.

By Mr. Eldredge:

Of course, it was a verbal conversation, but I think you suggested it. In soft ore, the value of the right of way would be the value of the ore it would tie up. I told you that the Baron formation was hard, and wouldn't tie up more than there was under the right of way—perhaps not that much.

Q. The $75 and $150 you have given there is your judgment of the valuation, is it not?

A. When I come to think about it, and when you mention it, I know we did have a conversation of that description.

Q. Then whose judgment was it, yours or mine, that you are testifying to?

The Master: Do you understand the question?

A. I understand it. Of course, I don't know just what is was; it might have been a suggestion from you, in the first place; I don't say but what it was; it might have been; but I remember talking about that the right of way on the Baron mine was not a detriment to taking the ore out—not like soft ore mines.

Q. But the question is the value; whose judgment is that; is it your judgment that the value is as you have stated—$75 and $150 respectively?

A. Why I should say it would be $75 on that particular property.

Q. That is your judgment?

A. Yes.

Q. How about the other property—the same way?

A. All the Humboldt property is about the same formation—hard.

1170 KENNAUGH.

Redirect examination.

By Mr. Wykes:

We are now mining about 300 feet under the track at Humboldt. It is about 600 feet perpendicular, and so deep that there is no danger of a cave-in.

I never saw you before you came into the courtroom here, today, and you never talked with me about the values that I placed on this land.

I didn't take into consideration the fact that the right of way might be moved off, to a nearby location, when I said that the value of the right of way might be the value of the ore under it. That wouldn't be necessary at Humboldt.

1171 On April 20, 1914.

L. J. LE VEQUE, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live in Marquette, where I am in the real estate business. I am handling rural land, mostly.

I own the S. E. ¼ of the N. E. ¼ of 12, 47-23, near Sand River station, Marquette County, which I will sell for $5 an acre. It is worth about that.

I own the S. W. ¼ of the N. E. ¼ and the S. E. ¼ of the N. W. ¼ in section 3, 47-29, Humboldt Township, Marquette County. That is in a swamp, and I would consider it worth about $6 an acre.

I own property in the West End Add., in Marquette, and will sell it for just about what it is assessed at.

I have a one-half interest in the N. E. ¼ of the S. W. ¼ of section 15, in Marquette, 38.21 acres. I will take $50 an acre for my interest. It is in 15, 48-25.

I sold some lots in block 10 of Nester's Add., in Marquette, for $20 to $30 a lot.

I sold lots 1 and 2 in block 1 in the West End Add., on Washington St., at $115 each.

LE VEQUE.

Cross-examination.

By Mr. Eldredge:

I deal chiefly in timber land. Where I have cut-over land, it is generally where I have sold or removed the timber. In Humboldt Township, the lands that I own do not include the mineral rights.

1172 On May 4, 1914.

F. J. BURTLESS, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live at Lansing, where, for ten years, I have been Secretary of the Board of State Tax Commissioners and State Board of Assessors. I have been connected with the State Board of Tax Commissioners continuously for 14 years.

The Board has, every year since the law went into effect, employed a competent stenographer to report all testimony and statements made by the representatives of the different railroad companies upon review. This testimony has been transcribed and bound, and is a part of the records of the office. The attorneys are always sworn before they give those statements; it is the intent to have the statements made under oath. The stenographic report was made for each year, from 1902 until the present time. I think Glenn L. Williams was the stenographer each year until the last three or four years. He is now circuit court stenographer in Lenawee County. After the statements made on review are taken, they are always written up.

(Mr. Eldredge objects to the testimony as irrelevant and immaterial, and as having no tendency to prove the correctness of the notes, which cannot be proved except by the stenographer or some one who heard the statements.)

As Secretary of the Commission, I have the typewritten notes of those reviews, which are considered records of the State Board of Assessors. They are frequently referred to by members of the Board, and are regarded by the Commission and by the employees in the office, and by those called upon to use them, as nearly correct as it is possible to get them.

A transcript of the stenographic report does not show, in all cases, whether the representatives were sworn, or not, and there is nothing to show that Mr. Eldredge was sworn when he appeared before
1173 the Board, on Jan. 7, 1903. The law governing the assessment of railroad property provides the date upon which an as-

sessment must be made, and then provides that for a certain length of time these assessments shall be subject to review, during which time the representatives of railroad companies may appear and make such statements as they desire; it is these statements that are taken down stenographically.

BURTLESS.

Cross-examination.

By Mr. Eldredge:

It does appear that in some cases they were sworn.

1174 (Mr. Wykes produced a printed copy of the report of the land department of the D. M. & M. R. R. Co., being a cumulative statement from Feb. 1879, to Jan. 1, 1912, and asked to have it marked Defts.' Ex. 65. He stated, further, that he assumed plaintiff had a duplicate, or an authenticated copy, and called on plaintiff to produce it. Mr. Eldredge stated that he had no such copy, and knew nothing about any part of the report, except one item.)

1175 On May 4, 1914.

THOMAS MCCORMICK, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live in Lansing, where I work for the State Board of Assessors. I have access to the different reports of the railway companies to that Board, and have recently taken certain of the figures for operating expenses for different railroads from those reports and tabulated them; the tabulation is embraced in nine sheets. For the companies named in those sheets, I took off the operating ratio, the maintenance of way, maintenance of equipment, traffic, transportation, and general, expenses, and the total.

The first company named is the D. S. S. & A., for which I have two tabulations, the first being for the system and the other for Michigan.

For all the other railroads named the figures are for the system. In each instance, I kept the reports for the years 1908 to 1913 inclusive, except the Detroit, Bay City & Western, which has had but two or three years' operation, and the Soo Line, the 1909 and 1910 reports of which were not in the office when I made the compilation. Under the item of expenses in each instance, I have included another set of figures which represents the percentage which that item bears to the total. Everything else but those percentages appears in the reports. I computed the percentage, myself, and have checked all the figures, to see that they are correct.

(Mr. Eldredge objects to the introduction of the compilation, but admits he may be inconsistent if plaintiff has put in similar compilations to prove its case.)

(The compilation is set forth in full as follows:)

Year.	Operating ratio.	Maintenance of way.	Maintenance of equipment.	Traffic expense.	Transportation expense.	General expense.	Total.

1183 I have now the reports from which these figures were taken, and will produce for Mr. Eldredge any of them which he desires in order to get the figures that he says are material.

McCORMICK.

Cross-examination.

By Mr. Eldredge:

The figures given first are for the D. S. S. & A., entire system; next, for the same road in Michigan; next, the Mineral Range, which is entirely in Michigan; next, the Soo Line, which covers the system.

The Soo Line report for 1906 does not detail the mileage as to states. The total miles operated are 1,039.71, main line, but it does not detail as to states, and I do not know, of my own knowledge. The 1911 report gives main line, Michigan, 191.09 miles, Wisconsin, 262.80, Minnesota, 224.98, North Dakota, 361, and total owned, 1,039.87 miles; total operated 1,798.40. For the year 1908, the total expenditures for maintenance of way in Michigan was $163,342.84, which is 19.33% of the total; the maintenance of equipment expense was 19.40%; traffic expense, 2.92%; transportation expense, 55.91%; general expense, 2.41%.

We haven't a 1910 report. Mr. Parker gave me that figure of 56.03% for 1909. It was not taken from the records in the office. (Mr. Eldredge moves that the figure, 56.03%, being the ratio of operating expense of the Soo Line, for 1909, be stricken out.)

For 1911, maintenance of way and structures was 21.08%; maintenance of equipment, 20.09%; traffic, 2.97%; transportation, 52.74%; general expense, 3.17%. The 1912 report was missing; we will find it.

1184 For 1913, maintenance of way and structures was 16.87%; maintenance of equipment, 22.66%; traffic, 2.47%; transportation, 54.75%; general expense, 3.23%.

I do not know on what basis the Soo Line separates Michigan operating expenses from those for the balance of the system. For 1908, the total operating expense ratio for the Soo Line for Michigan was 75.85%; for 1911, 76.26%; for 1913, 72.36%. I will furnish the figures for 1912, if I can find the report. For 1908, the total main line operating mileage of the C. M. & St. P. was 7,516.33 miles. That was divided as follows: Michigan, 159.12 miles, Wisconsin, 1,774.12, Illinois, 413.45, Iowa, 1,869.95, Minnesota, 1,241.79, North Dakota, 152.76, South Dakota, 1,534.63, and Missouri, 140.27. For 1913, the total mileage was 9,321.99, divided as follows: Illinois, 411.92, Wisconsin, 1,765.09, Iowa, 1,868.30, Minnesota, 1,238.60, North Dakota, 378.85, South Dakota, 1,795.54, Missouri, 140.27, Michigan, 167.04, Montana, 818.04, Idaho, 197.31, Washington, 541.03. The gross revenue from operation in 1908 totalled $56,932,620.50, of which $830,684.07 was from Michigan. Its ratio of operating expense to gross revenue in Michigan is estimated at 87.76%.

I will prepare a statement showing for each year, from 1908 to 1913 inclusive, the gross revenues of the C. M. & St. P., its gross revenue in Michigan, and the ratio of its operating expenses to its gross revenue in Michigan, and divide the maintenance of way and structures, maintenance of equipment, traffic, transportation, and general, expenses, as I have divided it with reference to the system. I will do the same thing with reference to the C. & N. W. separating its mileage into the states through which it operates.

I have prepared the information for which you asked me with reference to the C. M. & St. P.; it is contained in the sheet which I hand you.

I have prepared the information for which you asked me with reference to the C. & N. W.; it is on the sheet which I hand
1185 you. It is stated in the report that the expenses are proportioned to Michigan on the train mileage basis.

I have also prepared the same information with reference to the Michigan Central, but have taken the information from the reports of that railroad to the Michigan Railroad Commission. I have prepared the same information with reference to the L. S. & M. S.

The Ann Arbor has very little mileage except that which is in Michigan. The Chicago, Detroit & Canada Grand Trunk Jct. Ry. is about 60 miles long, and a part of the Grand Trunk System; it runs from Port Huron to Detroit. The Detroit, Bay City & Western lies entirely in Michigan, it is a new road, which commenced operation in 1911, but was not assessed for that year.

The total mileage of the G. R. & I. is 522.51 for main line operated, of which 376.14 is operated in Michigan; 313.43 are owned in Michigan, and 53.10 in Indiana.

For 1913, the operating ratio for G. R. & I. was 79.18% for the system, and 77.67% for Michigan. For 1912 the ratio of operating expense was 77.84% for the system and 80.53% for Michigan. In 1913, they were the same, 87.47% for each. In 1910, they were almost the same on the system and in Michigan, there being .34 of 1% difference. In 1909, Michigan was .88 of 1% less than the system.

The Pere Marquette does not separate its operating expenses in Michigan from the system in its reports to the State Board of Assessors.

1186 On May 5, 1914.

EDWARD C. COOLEY, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have lived at Ishpeming about 27 years; I have been in the real estate and insurance business about 12 years, maintaining offices at both Ishpeming and Negaunee, and acting as agent, and buying and selling lands in and around those places. I have bought and sold lands of my own during that time. I am familiar with South Shore,

and the property along it, from the west limits of Ishpeming to the east limits of Negaunee.

From Winthrop Jct. west to the city limits of Ishpeming, I should judge that the land is worth about $100 an acre. I know very nearly where the city limits are.

From Winthrop Jct. east to the roundhouses shown on Complt.'s Ex. 15, Riggs, the lands along, South Shore right of way are worth about $200 an acre. From the roundhouses to the point where the line between sections 9 and 10 crosses South Shore, the lands are worth about $500 an acre. From that point to where the section line crosses the railroad to the first street shown on Ex. 15, the lands are worth about $500 a lot. There are six or seven lots to the acre; that land could be platted and used for residence purposes.

Between Spruce and Lake Sts., the land is worth about $800 a lot. Between Lake and Pine Sts., the land is worth about $1,200 a lot. Between Pine and Main Sts., the lots facing on Canda St. are worth about $1,400 a lot, while those fronting on Main St. are worth $150 a front foot. Between Main & First Sts., the short lots next to the railroad are worth $2,000 a lot. Assuming South Shore station property could be divided into lots, I should think that it would
1187 be worth about $3,000 a lot. The post office property, directly southeasterly across the track, contained four lots and a fraction, and sold for $12,000. I should say the station property was worth $3,000 for the same sized lots as those in the post office property, which were about 35 by 100 feet.

Just north and east of the station, the railroad is crossed by the line between sections 3 and 10, 47-27. From that point to the east 8th line in section 3, the land is worth $1,200 per lot. From the east 8th line of section 3 to the section line between sections 3 and 2, 47-27, is not a good location. The lots are worth $800 each. From the section line between 3 and 2 to the edge of the Jackson Iron Mining Co. plat, which is immediately east of the east 8th line of section 1, the land is worth about $250 an acre. Only one piece of land by Union park could be platted in that strip. Both ends could not be. Union Park is across the track from, and slightly east of, the Iron Duke, which is marked on the map. There is no uniformity of value through that strip, which is about 1¾ miles long. I have balanced the property near Union park against the balance, which is low and swampy, and cut by gullies and railroads, so that it is not possible to use it for either farming or residential purposes. I just lumped it, and called it $250 an acre.

Some portions of Union park are low; the larger portion of it is very level. The center there by Union park would have a considerably higher value than $250 an acre, taken by itself, while the ends would have a much less value, taken by themselves.

From the west side of the Jackson Iron Mining Co. plat, which is about on the east 8th line of section 1, 47-27, to Cyr. St., Negaunee, the land is worth about $300 a lot. From Cyr. St. to the east line of Pioneer Ave., the land is worth $75 a front foot on Iron St.
1188 The two lots lying between the railroad track and Lincoln St. and facing on Pioneer Ave. are worth about $2,000 each.

From the back end of those two lots east to the point where the new line intersects the old line of South Shore, which is near Healy Ave., the lots on Lincoln St. are worth about $1,200 each. The land on the south side of the tracks from that strip is level, and might be used for platting, but it is on the wrong side of the track, and is worth about $800 a lot. The Lincoln St. lots run back to the railroad on the west end, but not on the east. The lots on Jackson St. are worth more than the land behind them, where the railroad is.

From Healy Ave., extended to the track, to the line between sections 6 and 5, the land on the north side of the track could be used for dwelling purposes, and is worth $400 to $500 a lot. Immediately on the south side of the track is Ann St., which runs east and west. The lots on Ann St. are worth about $800.

From the line between sections 6 and 5, and following the railroad east for one-half mile, the land is worth about $200 an acre. From that point, which is the quarter line through section 5, going east 80 rods to the 8th line, the land is worth from $150 to $200 an acre. From the east 8th line of section 5 east to the city limits, the land is worth not to exceed $200 an acre. It is low and marshy; you can raise nothing on it but hay; it is too low for potatoes.

My values are placed without reference to mineral values, and represent only the surface values.

COOLEY.

Cross-examination.

By Mr. Eldredge:

1189 I have not dealt in lands to speak of, from Winthrop Jct. to the west city limits of Ishpeming; those lands belong to the mining company, and are not for sale. They have, however, in some instances sold the surface rights. Between Winthrop Jct. and the west city limits, there are no mine locations. From Winthrop Jct. east to the roundhouses, there are quite a number of locations. Right at the junction, they are quite thick; from there to the roundhouse, there are very few dwellings. North of the track and west of the cliff shaft, there are not very many houses; that is quite a ways north of the track. Around the turn from the junction to the C. & N. W. roundhouses, there are very few dwellings. Directly north of the roundhouse there are quite a number, but, before you get to it, there are not over six houses on the north side; they are right along the track, between it and the road. On the north side of the county road, there are a good many houses.

I take those locations right along the track into consideration when I fix a value of $200 an acre; there, it is poor for residence purposes—all cut up with tracks and rock piles, and low, marshy ground, and not suitable for lots. If the tracks were not there, that land could be utilized for dwelling purposes and would be of considerably higher value.

By "location," I mean a group of houses. Between Spruce and Lake Sts. I valued the lots as they are platted, at $800 each; they

are scarce and the buyer doesn't look at a few feet difference in frontage. The frontage on Main St. of the property where Tillson's drug store is, I valued at about $150 a front foot. It is one of the most valuable pieces of business property in Ishpeming. I am not certain about the size of those lots; I think they are 33 to 35 feet. I know of a sale of property on the corner of Main and Pearl Sts. It was the Gately lots on Man St. and sold for $7,500, according to the common talk. $500 would cover the price of the old frame building, so that the land brought $7,000 for 35 feet frontage; that makes $200 a foot.

1190 The frontage on Main St. of the Tillson property is just as valuable as the Gately property, for some purposes. Perhaps I told you that the Tillson property was worth $200 a front foot on Main St. I did tell you that they were of equal value and worth $200 a front foot, but I think that Gately paid an excessive price for that corner property; it was worth more to him for his purpose than it would be for other purposes.

The streets from the South Shore station west are First St., Main St., Pine St., Lake St., and Spruce St. I wouldn't want to put a value on that 12 foot right of way of the South Shore through that stretch, because I don't know enough about it; I don't know what it could be used for. The 12 foot strip, where it fronts on Main St., opposite Tillson's, joins the tract of land owned by the C. & N. W., and that land could be utilized all the way to the buildings on the south side of the C. & N. W. track, in case the South Shore track wasn't there. The C. & N. W. joins right onto the back end of the Jenks block. The C. & N. W. strip is a trifle over 100 feet wide fronting on Main St.

Looking at Complt.'s Ex. 15*a*, Beldon, I should say that the width of the C. & N. W. right of way on Main St. is a trifle over 100 feet.

Q. Is not the frontage of the C. & N. W. railroad on Main St. in Ishpeming, and the frontage of the D. S. S. & A. on that street, of as great value as the frontage of the business property on each side of it?

Mr. Wykes: Just a moment before you answer. I wish to object to it because the question does not present the title as it stands, the title being track rights in a street.

The Master: You may answer the question.

A. I don't think so.

1191 The South Shore property is corner property on the north side, but the C. & N. W. is not corner property. Combining the South Shore 12 feet, and enough of the C. & N. W. to make a 50 foot lot frontage on Main St., and on the corner of Canda, that lot would not be as valuable as the property next north of it. I should prefer to have Tillson's corner to that corner, because it is nearer the hotel; is a more prominent corner. It is right across the narrow street from the Tillson corner. Assuming that the 12 feet owned by the South Shore could be utilized for business purposes and made part of adjoining property, and that the lots were 35 foot front, it would be worth $125 a front foot. I think the lots are

usually 30 to 35 feet; the stores are sometimes narrower. I valued the property at that because it fronts on Main St.

Starting at the east end of Excelsior Iron Co.'s plat, which is the west line of Sec. 2, 47-27, the next property is the S. W. of the S. W. of section 2, 47-27, which is worth about $1,000 an acre, probably, for the most valuable use to which it could be put. I will modify that, as I didn't know what was included. From the section line across the forty I would put its value at $300 an acre; the street railroad runs across it; it is pretty well broken up. There is a large bluff on the north side and low land on the south side, and it is cut up by the tracks, and not as valuable.

The forty next west of Union park, which is the S. E. of the S. W. of 2, 47-27, I meant to value at $1,000 an acre; the S. W. of the S. W., which is the one west of the plat there last described, I valued at $350 an acre; the forty on which the Union park is situated is worth $500 an acre. The Union park forty is not as convenient to Ishpeming as the forty next west, which I valued at $1,000 an acre. Lots on the Union park forty which might be suitable for platting would be worth possibly $200 each, if 75 feet front
1192 by 150. As a matter of fact, none of the property can be purchased; it is held by the mining companies.

The land in the next forty east, which is the S. E. of the S. E. of 2, 47-27, would be worth about $100 an acre along the street railway track, north of the South Shore track. It could only be used for farming on the side hills, and not all of it for that. I did not have in mind the same forty which you had in mind. The forty next east of the Union park is pretty well broken up, and is worth $150 an acre. Part of it might be used for farming or pasture; part of it is fair, and the other, along the line of the South Shore, is really valueless, on account of the character of the land.

The next forty, which is the N. W. of the S. W. of 1, 47-27, is very poor land. The South Shore and C. & N. W. and L. S. & I. overhead crossing are on that forty.

The land in that forty where the South Shore runs through near the overhead crossing is low ground; that is right in the old Jackson Iron Co. location.

In my judgment, the value of the land adjoining the South Shore in that forty is not $50 an acre. It is all broken up and rocky. The road beds cut it up, and it couldn't be used for residence or farm purposes; I don't know that it could be used for any purpose. On the north side of the north line it is low ground and swampy; on the south side of the south line it is rocky bluff; between the two it is all broken ground, and the roads cut it through. The C. & N. W., the L. S. & I. and the two South Shore lines come in there. I certainly think that those railroads lessened the value, and base my price on the fact that the land couldn't be used for any purpose that I know of because of the way the railroads cut it up and the
1193 character of the land itself. If the railroads were not there and it was leveled, it might be used for some purpose.

The next forty is the S. E. of the N. W. of 1, 47-27. On the north side of the South Shore it is quite swampy, and worth about $50 an acre. The Power House of the Marquette Traction line is on

that forty, and right around it the land is fairly good. Right west of there it is very low and very swampy. There is a lake 200 or 300 yards west of the power house.

Lots 39 and 40, of Iron plat, commonly known as the Pendell plat, in the city of Negaunee, sold for $25,000. They were the Neeley lots, and had a brick building. In Negaunee, it is very difficult to buy lots of any kind for residence purposes. The property which is for sale for residence purposes is comparatively limited, unless you go outside of the now platted portions. There is very considerable demand for residence property there, and the town is growing rapidly. Three new shafts are being sunk, and it is expected that when they are opened they will employ a considerable number of men. It will then be difficult to get residence lots, unless they plat some more.

Because of the supposition that ore underlies the valley east and south of Negaunee, it is very difficult to buy land for platting purposes. I know Maitland Add. to the city of Negaunee, and should judge that lots were selling from $1,000 to $1,500 each. Ann St. lies directly south of the new line of the South Shore; I put the lots that front on Ann St. at $800 each.

The property of the South Shore between Peninsula St. produced north, and Cyr St. in Negaunee is in more of a residence portion than business portion. Between Silver St. and Gold St., it is in the business part of town north of the track, but not south of the track. The business buildings abut on the South Shore between Silver and Gold Sts. on the north side.

1194 That is also true on the north side between Gold and Cyr Sts. On the south side, the property is not for sale at all; it is held by the Cleveland Cliffs Iron Co. I valued the lots that are put on Ann St., south of the track, at $800 a lot, but don't want to value the land along the road from Pioneer Ave. east to Healy Ave., because I don't know what they could be used for.

From Cyr St. west to the end of the Jackson Iron Co.'s plat, beginning at the crossing of the South Shore and C. & N. W., I valued the lots at $300 each, for 50 by 125 feet.

COOLEY.

Redirect examination.

By Mr. Wykes:

In the course of my cross examination, when I was asked about, and answered with reference to, the fact that certain descriptions or areas were cut by the railroad, I meant that the presence of the railroad cutting through a description would, if the railroad stayed there, prevent the use of the entire description, together, either for platting or anything of that kind.

1195 On June 2, 1914.

MELVILLE W. THOMPSON, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I am 41 years of age. I am a specialist in railroad litigation, involving accounts and engineering; business address 111 Broadway, New York; formerly of Michigan. I am by profession an engineer, a certified public accountant, bearing commission from the State of Michigan, and a member of the Michigan bar; a member of the Michigan and American Societies of Certified Public Accountants, and of the American Economic Association. My professional work was preceded by about fifteen years' business experience; of which, three years bank clerk, and twelve years officer of, or partner in, manufacturing concerns.

My attention has been exclusively devoted to special professional work, in railway accounting and engineering, during the past ten years, the first five years of which, was in the service of Michigan, in the State's railway litigation, and the last five in private practice in New York City, in litigated railway cases and in examinations for financial people. The latter period also includes engagements by the Attorney General's department of Michigan totaling about one year's time; and between the two periods I was in the employ of the Interstate Commerce Commission.

The principal cases on which I have been employed by the State of Michigan are: Railroads vs. Auditor General (Michigan Ad Valorem Railroad Tax cases), Michigan Central vs. State of Michigan (Michigan Central Charter case), Attorney General vs. Michigan Central (Michigan Central Delinquent Tax case), and the present case.

1196 I was employed by State and City of New York in the Third Avenue Franchise Tax case, re franchise values, and depreciation.

I was special assistant to its Statistician and Accountant at the time when the Commission was formulating the present classifications of railway accounts under that amendment of the Interstate Commerce Act known as the Hepburn Bill, participating in all the work on the classifications of revenue, construction and operating expense accounts, and giving special attention to depreciation accounting, and accounts for outside operations.

My principal quasi-public cases in private practice in New York City were:

Central of Georgia Income Bond cases, a series of cases in which I was employed by the income bondholders to determine the true income of the railroad applicable to the payment of interest under its income bond mortgages.

Read et al. vs. Lehigh, in which I was, and now am, employed by the Stockholders Protective Committee of the Lehigh & New York Railway, a subsidiary of the Lehigh Valley, to determine the proper

distribution of revenues and expenses between the parent road and the subsidiary.

Appraisal of L. & M. S. Ry., in which I have been retained by the principal group of minority stockholders of the Lake Shore road to determine the value of its capital stock, in connection with the proposed merger of the Lake Shore and New York Central. Engaged in this work at the present time.

1197 Mountain Ice Case, a rate case in which I was employed by the Lackawanna Railroad to make separation between its costs of transporting passengers and freight.

Morristown & Erie vs. D. L. & W., a case which involves pro-rates between a trunk line and a lateral.

Syracuse and Baldwinsville vs. New York, a case which involves the determination of the capital value of a railroad's physical assets as affected by its income.

D. L. & W. vs. Kingston Coal Co., a case which involves the compensation of a coal mining company under an operating contract.

Report on the B. R. & P. R. R. Co., its value, its distribution of expenditures between operating expenses and betterments, its strategic situation in respect of coal traffic, and the value of controlled coal mines.

Report on the operating efficiency of the Lackawanna Railroad; subsequently employed to devise, and to superintend the introduction of, improved operating methods in its motive power department and repair shops.

Appraisal of the stock of the American Refrigerator Transit Company, a private car line controlled by the Missouri Pacific, Iron Mountain and Wabash railroads.

I. C. C. Express Rate cases, re cost of express service.

A number of other litigated cases and financial and engineering examinations.

1198 I may add that as my business in New York has grown I have built up an efficient organization of accounting and engineering assistants, experts in their several departments, a number of whom have been employed in extracting and assembling the details and compiling the figures presented by me in this case.

I was employed by the State for the purpose of investigating certain accounts of the D. S. S. & A., and of making certain assignments of certain of the expenses, and Defts.' Ex. 72 is the result of my work. It contains complete ratios and complete assignments and the final summary of my figures. The subject matter of pages 4 to 15 is a general description of the problem of attack, and of some of the principles directed toward its solution; also, in this portion of the Exhibit there is briefly discussed some of the methods which I considered to be fallacious that have been attempted to be applied by others to this or similar problems. Pages 17 to 25, both inclusive, contain an index of pages 26 to 43, both inclusive, the latter pages setting forth an explanation of the mode of determination of the several ratios of assignment used in deriving proportions of common accounts of expenses which should be attributed

to passenger or to freight, or to various components of passenger. That is, on pages 15 to 26 appears a statement of the ratios, and on pages 26 to 43, the details pertaining to those ratios. All of the various figures, etc., from which the ratios are derived are not set forth on these pages. I have compiled those in detail.

Pages 44*a* to 44*c* set forth a chart, or key, which makes clear in respect to each of the 116 operating expense accounts the several ratios, by number, which are used in assigning the common expenses applicable to such account, individually. To ratios
1199 which I determined, I gave a number, and pages 44*a* to 44*c* classify the application of those ratios to the different primary accounts. Upon pages 45 to 54 inclusive is set forth a tabulation, in semi-descriptive form, of the plan of my computation relating to each of the primary operating expense accounts, in detail, seriatum, an explanation in respect to each individual acount; the steps passed through to obtain final results.

On pages 54*a* to 55 is set forth a schedule of the five general accounts of operating expenses and the 116 primary accounts respectively subordinate thereto, by name. On pages 57 to 152 is set forth the actual computation by which there is distributed between the several components of the accounts those portions thereof which in my opinion should be assigned to the classifications which I have made of the expenses; that is to say, on these pages, account by account, is set forth the computation assigning common expenses to Michigan passenger, and the further subdivision of the passengers and baggage expenses to the interstate and intrastate, etc. Pages 154 to 161, are a summarization of the results.

Referring to page 45 of Defts.' Ex. 72, the table there represents my judgment as to the proper method of dividing the several expenses, described, between Michigan passenger and freight, in view of the material available to me. Taking into account the method in which the company kept its accounts, it is my judgment that this is a proper method. As to the division of Michigan passenger common expenses between passengers and baggage, mail and express and sleepers and diners, the method expressed in the table beginning on page 45 is my judgment of a proper method, and the same is true as to the division of passengers and baggage
1200 between interstate and intrastate.

When you ask me if this represents my judgment, and I say "yes", I mean it represents my judgment in view of the material available from the company's records. I do not say that, if I began at the beginning and went over a course of several years, having control of their accounting, I could not create more perfect records of the company's books, which would avail me to exercise my judgment to better advantage.

The first column sets forth the names of the accounts, with certain sub-primary subdivisions of the primary accounts. The second column, headed "Michigan Passenger," sets forth the method by which was determined the amount of each account attributable to the cost of carrying all passengers in Michigan. The third column headed "Michigan Passenger subdivided to Passengers and Baggage, Mail

and Express, Sleepers and Diners," sets forth the method by which the expense attributable to the cost of carriage of all passengers in Michigan has been distributed to passengers and baggage, to mail and express and to sleepers and diners. The fourth column headed "Passengers and Baggage to Interstate and Intrastate," sets forth the method by which the item "Passengers and Baggage," in the third column, was subdivided between interstate travel in the state, and intrastate passengers in the state.

Under the Maintenance of Way and Structures, Superintendence is divided between Michigan passenger and freight, on the results of the computation made in respect of the activities represented by the several accounts to which the superintendence was directed. These results are expressed in accounts 2 to 17 inclusive, and 22. I
1201 passed account 1, Superintendence, and obtained results from accounts 2 to 17 and 22. Then, having obtained results for the accounts last mentioned, I obtained the proportion that the several totals of their components bore to one another, and applied those proportions to account 1, Superintendence. The details for that division are on page 57. Supporting details are on pages 58 and 58*b*; further supporting details on pages 59 to 83 and 85. The primary details on which those figures are supported are set forth in an appendix, showing derivation from the company's records. That appendix is not part of Defts.' Ex. 72.

The method of division of account 1, Superintendence, between passengers and baggage, mail and express and sleepers and diners is the same as described for the division between freight and passenger. The division of the same item, between interstate and intrastate passengers, was made upon the ratio of the passenger mileage interstate and intrastate in Michigan, which is my Ratio 10.

In respect to account 2, Ballast, page 45, I found that the amount allocated to Michigan by the company for the fiscal year 1912, to which year all of my computations are directed, was excessive, relatively, to the amounts charged for the five years including and ending with 1912, and I computed an average for the five years past and used that average as the proper figure for 1912. Such average I subdivided between first, tracks exclusively devoted to passenger service, second, tracks exclusively freight, and third, tracks used by the passenger and freight services in common, my computation to obtain such results being upon my Ratio 2, equated tracks miles, Michigan, subdivided between passenger, freight and common, as set forth
1202 on page 28. I then divided the common expenses between passenger and freight on the basis of the gross ton miles respectively attributable to each, according to my Ratio 1, set forth and explained on pages 26, and 26*a*. In describing my computations, I confine myself to Michigan as to steps which succeeded the allocation of costs to Michigan.

Having obtained the total passenger expenses, I subdivided it into three groups, passengers and baggage, mail and express and sleepers and diners, upon the basis of the gross ton mileages respectively attributable to these three sorts of service, upon my Ratio 1*a*, set forth and described on page 27. Having obtained the sum at-

tributable to passengers and baggage in Michigan, I subdivided it between interstate and intrastate passengers in Michigan on my Ratio 10, set forth on page 36.

Having obtained my final results I carried them to the summary at pages 153 to 161, in which all of my final results are summarized. In all divisions of passengers and baggage between interstate and intrastate, I applied Ratio 10, with the exceptions of accounts 54, Outside Agencies, 55, Advertising, 106, Salaries and Expenses of General Officers, 107, Salaries and Expenses of Clerks and Attendants, 108, General Office Supplies and Expenses, 109, Law Expenses, 113, Stationery and Printing, 114, Other expenses.

With reference to Ballast, I refer to Ratio 2, equated track miles, Michigan. This is subdivided between passenger exclusive, freight exclusive, and common. My method of determining this ratio was as
1203 follows: The main tracks in Michigan, being main line and branches, traffic spurs was classified as passenger and freight common, and freight. The freight was further subdivided into merchandise and ore. The second track was designated as main track, passenger and freight common. The sidings were classified into passenger exclusive, freight exclusive, and passenger and freight common, and the freight sidings were classified into merchandise and ore. The mileage of each class was taken from the Riggs appraisal. Changes in mileage during the fiscal year 1912 were ascertained and one-half of the net increase added to Riggs' figures. The mileages of the main and of side tracks were then equated on the basis that one mile of main line is equivalent to three miles of side track. Having obtained the totals of the several classes, in terms of mileage, by the method explained, the proportion existing between them as expressed in terms of percentage; i. e., treating the total as 100 per cent. I found that tracks used in the passenger service exclusively amounted to .09% of the whole, tracks used exclusively in freight to 13.32% and in common passenger and freight to 86.59%.

The purpose of Ratio 2 was to ascertain the track mileage in Michigan and the use to which the track mileage was devoted, in order that certain expenses might be assigned against the classes of traffic to which they should be charged. The purpose was in part to facilitate the setting off to exclusively-used track the expenses appertaining to that track.

I set forth a general description of Ratio 1, on pages 26 to 26*a*
1204 which will explain the general method of determining this ratio. The purpose of determining the ratio was to discover the proportions in which expenses of maintenance due to mechanical wear should be apportioned between the classes of traffic to which such wear was attributable. In my description of Ratio 1 on page 26, the term "tare weight," is the weight of the car with no load. The term "live weight," or "live load," means the load carried in the car. The passenger train load was assumed as ten tons, meaning the total weight of the passengers, baggage, mail and express matter carried on a passenger train. I estimated that the average weight would not exceed ten tons, and think that a safe estimate. Ten tons is more than the actual average weight, and would tend to increase the pas-

senger percentage and the charge against the cost of carrying an intrastate passenger.

I applied the gross ton mileage ratio to Ballast, because in my opinion the renewing of ballast is attributable in greater part to mechanical wear by the passage of trains than to any other agency, as the effect of time, in the sense of weather stress, causing erosion. I have in each of my several computations taken as the determining factor which decided me in the use of one ratio as against another, e. g., the gross ton mileage ratio, which reflects mechanical wear, in contradistinction from the time ratio, which affects decay attributable to the passage of time. Thus, while I recognize that a portion of the cost of replacing ballast follows erosion due to the elements, I consider that the cost of replacement is in far the greater part attributable to the mechanical wear caused by the trains. Therefore, following my plan, I have in each case taken the principle proximate cause and made my computations on the basis of that controlling element.

1205 The ratio of mechanical wear as between passenger and freight and the ratio of time use of tracks are so nearly alike that the use of either in place of the other for any portion of one of the accounts, would not produce a material difference in the final result.

Ratio 1 subdivides between passenger and freight, and Ratios 1*a* and 1*b* subdivide passenger into passengers and baggage, mail and express and sleepers and diners. Ratio 1*a* contemplates all trains on the plaintiff's tracks, whereas Ratio's 1*b* does not take into cognizance trains of other companies on plaintiff's tracks, but does include plaintiff's trains on the Mineral Range July, August and September, 1911. Those variations were made for application to different items of expense.

The method of obtaining Ratios 1*a* and 1*b* are set forth, on pages 27 and 27*a*, in sufficient detail to be understood. The purpose of these ratios was to determine what share of expenses attributable to passenger trains should respectively be assigned against passengers, and their baggage, on the one hand, and against mail and express and sleepers and diners.

I do not regard the cost of haulage of mail and express or sleepers and diners as any component part of the cost of transporting intrastate passengers with respect to a given statutory rate of fare applying to the latter.

The method applied to the division of the items, Ties, Rails, and Other Track Material, Under Maintenance of Way and Structures, is

1206 the same as that described for Ballast. My judgment is that the predominant cause of the expenditure is the mechanical wear. I apply the gross ton mile ratio to the division of those expenses which result from mechanical wear because it is my opinion that the destruction of track structure is a function of the gross ton mileage passing over the track; that is to say, the weight of the trains is the main determining factor causing injuries to the track which require repairs and consequent expenses expressed in these accounts. The wear varies with the gross ton mileage, though not exactly. I think the wear due to freight trains is greater in proportion to the ton

mileage thereof than that attributable to passenger trains in proportion to their ton mileage. I have not weighted my ratio by any factor expressing such variance, but have taken what I believe to be a minimum. If I had weighted my ratio according to what I have just said, I would have thrown an increased amount of expense against freight and a decreased amount against passenger. Ratio 4, time, is described on page 31, Defts.' Ex. 72; its purpose was to determine the proper distributions between passenger and freight of those costs which run to time and are not effected by mechanical wear. In respect to costs that are effected by mechanical wear, it is my opinion that they should be charged against the service producing the wear, but in respect to costs not effected by mechanical wear it is my judgment that they should be assigned against the several traffics in the proportion of the time through which these traffics avail of the facilities afforded.

The time ratio expresses that as between passenger and freight. Time ratio 3 expresses the like in respect to subdivisions of passenger
between passengers and baggage, mail and express and
1207 sleepers and diners. When I say "passengers and baggage,"
I pluralize the "passenger" and mean the intrastate and interstate passengers, not in sleeping cars, in Michigan.

I have applied this time ratio, in general, to all expenditures which are the result of time and the elements and deterioration due thereto. Where I considered the majority of the number of dollars expressed in the account to be so attributed, I applied the time ratio to the total account. I reduced these different elements to ratios, in some cases because the company's records were insufficient (notwithstanding the fact that they might have been made sufficiently precise to avoid the necessity of computation by percentage assignment), but in other cases because the costs in question are not of a sort that can be reduced to precisely itemized accounts and require to be assigned between different services by methods of computation. What I mean by that is that respective wear of rail heads, for instance, caused by freight and passenger trains cannot be carried in the accounts item by item for the train, for each rail, and therefore has to be determined in a scientific manner by engineers and accountants and computed as between the respective services.

In getting at my time ratio, I computed the delays caused to freight trains by passenger trains and obtained the percentage thereof to the elapsed time of the freight trains between terminals, and I found that the delay so caused was 2.75 per cent of the whole time of the freight train, and I decreased the freight train time of occupancy accordingly. I did this for all of the trains on a series of representative dates to obtain from a series of dates results that
1208 would be approximately the same as would be obtained by a
computation for the whole year. I took seven days, 15 days apart, namely, March 30th, April 15th, April 30th, May 15th, May 30th, June 15th, and June 30th, all in 1912, which I thought sufficiently representative.

The figures in Defts.' Ex. 72 are all for the fiscal year July 1st, 1911, to June 30th, 1912.

Ratio 3, by which I divided certain expenses under Roadway and Track, and similar items between passengers and baggage, mail and express and sleepers and diners, was applied for the same reason as expressed regarding Ratio 1*a*. My reason for applying Ratio 3 to certain cases instead of Ratio 1*a* is that Ratio 3 applies to elements which proceed with the passage of time, whereas Ratio 1*a* applies to elements which proceed with mechanical wear, and the application of that ratio proceeds upon the basis that the amount of time occupancy of a car used in carrying express, or baggage, or mail, is the equivalent of the car carrying passengers. In my judgment, it is a proper cost accounting to so divide such expenses.

In item 7, under Maintenance of Way and Structures, Removal of Snow, Sand and Ice, I divided the common expenses between Michigan passenger and freight on the basis of Ratio 4, based on time of use. Before applying Ratio 4, I applied Ratio 2*a*. Ratio 2*a* is one of my equated track mile ratios; it is similar to my basic track mile ratio 2, but different in that exclusive ore tracks are excepted in Ratio 2*a* and I applied Ratio 2*a* to the equating of track mileage in respect of the removal of snow, sand and ice, because an investigation of
1209 that account indicated that but a small amount is charged to months of ore business.

In Account 7, Bridges, Trestles and Culverts, I divided common expenses on Ratio 4, expressing time-use as the expenses of their maintenance in the main run with time, and not mechanical wear. Under Michigan passenger, for that item, I adopted the company's own allocation; in fact, with very few exceptions, I adopted all the company's allocations of expenses to geographical localities or to distinct services. For accounts 11 to 14 inclusive, the plan of assignment, as stated by me on pages 45 and 46, expresses what I did and what I regard as proper.

Item 16, Buildings, Fixtures and Grounds, is subdivided by the company into several primary and sub-primary accounts, as set forth on page 76. We assigned the common items attributable to each of those several divisions on bases we thought appropriate to the several cases; thus, sub-division A, Shops and Storehouses, being maintenance of the railroad's repair shops, in which the equipment is repaired, and storehouses, in which supplies are carried, we subdivided on the same basis as account 24, Superintendence under Maintenance of Equipment.

The reason was, we considered the use of the shops and storehouses would substantially follow the superintendence, applied to operations conducted therein.

The sub-account Roundhouses and Turntables we subdivided between passenger outside and within Michigan on the basis of the total of our subdivision of accounts 72 and 81, Enginehouse
1210 Expenses, Yard and Road, it being our opinion that this form is a suitable basis of distribution of the expenses. Having obtained, thereby, costs attributable to Michigan passengers, they were subdivided between passengers and baggage and mail and express on Ratio 1*a*, which in our opinion was a suitable ratio for application at this point.

The next item, sub-account C, is station buildings and grounds. The common expenses were distributed between passenger and freight on the basis of occupancy of the buildings, as determined by an analysis of the station payroll, Ratio 17, page 43. The next subdivision of account 16, being sub-primary account B, Section, Hand Car and Other Houses. The Michigan total was distributed against passenger, freight and common on equated track mileage, Ratio 2. The common expense thereby determined was distributed to passenger and freight on gross ton miles, Ratio 1, as, in my opinion, the expenses attendant upon the section houses, etc., followed the principal division of the expenses in respect of the track laborers, which followed the wear on the track. We then subdivided between passengers and baggage, mail and express and sleepers and diners on gross ton miles, Ratio 1*a*.

Subdivisions E, Coal Sheds and Trestles, and F, Water Tanks and Pump Houses, I distributed on the same basis as accounts 73 and 82, Fuel for Yard and Road Locomotives, my reason being that coal sheds and trestles handle coal consumed in the several services, and should follow like distribution. Water tanks and pump houses supply water which is evaporated upon the burning of the coal, and should follow like distribution. The next subdivision on ac-
1211 count 16 is sub-primary account G, Track Scales. This is all attributed to freight. Sub-primary account H, Fixtures, I have distributed in the same proportion as the total results of my distribution of sub-accounts A, B, C, D, E, F and G.

Account 17, includes charges against the Marquette ore and merchandise Docks, which are exclusively freight, and assignable thereto. The remainder of account 17 is St. Ignace, merchandise and slip docks. This is mostly freight, and entirely incident to the Mackinaw Transp. Co., under outside operations, and no part is chargeable to intrastate passenger.

I distributed accounts 18 to 22 inclusive in the same manner as Superintendence, already explained. These accounts are of a general nature, and the same principles that apply to the distribution of superintendence expense apply. They should follow the distribution of the charges for the work done to which they were incident.

Account 23 is a credit to, or reduction of, accounts 2 to 16, and I apply the credits in the same proportion in which I applied the charges against those accounts.

Item 24, Superintendence, Maintenance of Equipment, divided on the basis of the results for accounts 25, 31, 34 and 43, being Steam Locomotives—Repairs, Passenger-train Cars—Repairs, Freight-train Cars—Repairs, and Work Equipment—Repairs, and of the account for sleeping, dining and special car repairs included in outside operations. Item 25, Steam Locomotives—Repairs: Ratio 13, set forth on page 39 of Defts.' Ex. 72, was arrived at from an actual inspection of the time books of the switching and
1212 locomotive men for the entire year. Ratio 13 subdivides the total switching service in Michigan, into passenger and freight, and, Ratio 13*d* subdivides in Michigan and extra Michigan the total system switching.

Ratio 14, applied in the division of item 27, is revenue passenger locomotive miles of the system, subdivided between Michigan and extra Michigan, and is a computation based on Mr. Delf's figures.

Accounts 31, Passenger Train Car Repairs, and 33, Passenger-train Cars—Depreciation: In the subdivision of total passenger, between passengers and baggage on the one hand and mail and express on the other, we arbitrarily adopted the respective percentages of 85 per cent and 15 per cent, as, in our opinion, the repairs and depreciation to coaches and baggage cars constitute a larger proportion of the whole than do the same for mail and express cars, relatively to the proportionate mileage of the two classes. They are percentages which would show a larger amount to passengers and baggage and a smaller amount to mail and express than would be developed by the computation of the car miles of the two classes. The car mileage percentage in respect of mail and express cars would be about 20%, whereas I have taxed their operations with about 15%.

Account 61, Superintendence, under Transportation Expenses: I have taken the system total subdivided it into Michigan passenger, following that of the passengers and baggage, mail and express and sleepers and diners, and then subdivided on the ratios produced by the sum total of all allocations and distributions of all of the other accounts under Transportation Expenses, being accounts numbers
62 to 105, except 94 and 97, which are distributed on the same
1213 basis as account 61.

Continuing through my plan for subdivision of expenses, beginning with account 62 and ending with 116, I think, if those items are read in conjunction with the detailed explanations which appear on pages 114 to 143 of Defts.' Ex. 72, they are self-explanatory.

Pages 30 and 31, Ratios 3*a* and 3*b*, are variants of Ratio 3. Ratio 3 subdivides passenger train car miles in Michigan, on D. S. S. & A. tracks only, into the three groups, passengers and baggage, mail and express and sleepers and diners, and is intended to base its distribution on the factor of time of use of the tracks by the several constituents of the trains.

Pages 4 to 15 inclusive of Defts.' Ex. 72, which I in general described this morning, was prepared by me. It represents a short statement of my views.

On page 159, Defts.' Ex. 72, the first entry in figures is to be read as follows: Operating expenses attributable to intra Michigan passenger traffic, 1912, total $209,422, that being the amount which in my opinion should be attributable to such expenses.

The amounts stated at the foot of the recapitulation on page 158, under the columns "Sleepers and Diners," "Mail and Express" and "Passengers and Baggage," express my judgment of the cost of doing those several classes of business in Michigan.

The amount $534,799, under "Michigan Passenger," is the amount
that I arrived at as the Michigan passenger expense, meaning
1214 thereby the total passenger expense in Michigan of all classes, including therein intrastate and interstate passengers. The

figures in the recapitulation include the assignments which I have made and the allocations of the company which I have adopted.

The workk was done by me and a staff of my employes. The principles upon which the work should be done were established by me, following conferences with my men and following examinations into the records, for the purpose of determining the extent of perfection or imperfection thereof. The actual extraction from the company's records of figures, being entered on our working papers, became a part of our records, was done by individuals in my employ and under my direction, and under the immediate direction of one of my engineers, in charge.

The figures appearing in Defts.' Ex. 72, offered in evidence, are immediately derived in all cases either from exhibits placed in evidence by the plaintiff in this case or from figures appearing upon the compilations from the company's records. They can be traced back either to the plaintiff's exhibits or to the supporting figures in my own compilations, and through the latter to the company's records. The starting figures used, are in all cases based on the company's records. The computations therefrom are based upon the company's records, but are worked out according to principles which I approved or constructed. The aggregate of each of these items of account which I have subdivided are the same as the aggregate furnished in Mr. Delf's exhibit for the same period. In respect of the account Ballast, instead of taking Mr. Delf's figures for 1912 alone, I took the average for five years. I eliminated from the account General Expenses the directly-charged expenses attributable to this case.

1215 The elimination of the St. Ignace docks and wharves expense I have already mentioned.

I considered the propriety of the use of the revenue train mileage basis for the purpose of dividing common expenses between passenger and freight. I think it is not a proper basis. My reasons in general are because the train mileage basis is a single measure applied to a complex set of circumstances, and this fact alone is sufficient to condemn its use.

In connection with what I have just said, I may say further, Mr. A. Hamilton Church in his book entitled "Production Factors in Cost Accounting and Works Management," which presents an elaborate explanation of the author's views as to the methods of apportioning indirect expenses, at page 172, he expresses himself in language which I desire to adopt as expressing my views in respect to the question I am now answering. He says, referring to his analysis, "It will probably be objected that this is a very complex and formidable way of presenting costs." He then goes on to say, in respect of so-called simple methods of attaining the desired end: "The answer is that in actual practice it (the detailed method) is not as difficult as it looks, but a still more complete reply to the objections is that no method that fails to provide the information in this detailed form is anything more than a sham. No facts that are in themselves complex can be represented in fewer elements than they naturally possess. While it is not denied that they yield no good results, it must still be recognized that there is a minimum of

possible simplicity that cannot be reduced without destroying the value of the whole fabric."

1216 The same author uses somewhat similar language in his book entitled "Expense Burden," at page 114, which I also adopt as expressing my views on this subject: "A few final observations may be offered on the subject of works accounting generally. Modern methods have taken their rise in the growing complexity of modern industry. They, like the industry itself, tend to become more complicated in proportion as the numbers of their factors increase. The snare of the simple system must therefore be avoided. * * * And just as the whole science of navigation hinges on higher mathematics, so the management of a considerable business turns upon intricate principles which are the horror of the rule-of-thumb men and sheet anchor of the progressive men of business." In final answer I say that in my opinion the use of the train mileage basis is a generalization not applicable to the facts here, and it does not produce a result which approximates the truth.

The truth of the results produced by the train mileage basis, or the degree with which the results of that basis would approximate the truth, would vary with the train loads, and with train constituents and with weights, the number of wheels and wheel impacts, and all of those various items, and with a cumulative condition of such circumstances it would vary greatly.

It is my opinion that the two classes of train miles (freight as compared with passenger) are not similar in cost or expense to produce, and I am of the unqualified opinion that, on the average, the freight train miles on this road are more expensive to produce than are the passenger train miles.

1217 In my judgment, the greater speed in the passenger service has more tendency toward the effect of making the passenger train mile cost greater, but it is not sufficient to offset greater freight cost due to certain elements; nor is it sufficient, when taken in connection with the other elements which might fairly be placed on the same side of the scales, to offset the elements which belong on the freight side.

In my judgment, and directing my reply to track structure of the plaintiff's road in the condition in which it is maintained for the freight service as well as for the passenger, variations in speed of passenger trains below 30 miles an hour do not produce a sensible variation or augmentation of injury to the track. I think that at speeds exceeding 40 miles per hour the damage to the tracks becomes sensibly augmented. At a speed above 40 miles an hour the damage to tracks produced by the element of speed, and described by engineers as due to the dynamic augment of the static load of the train, begins to increase noticeably, and increases very materially at high speed, say, speeds 60, 70, 80 or 90 miles an hour, but those speeds are not made on this railroad, with rare exceptions in the case of 60 miles, for short distances. Between 30 and 40 mile speeds, there exists an intermediate condition; in some instances there might be an appreciable difference in the injury to the tracks between 30 and 40 mile speed and in other intsances not. depending upon the condition of the equipment and the condition of maintenance of the tracks at different seasons of the year or on different stretches of

the road. The average speed of passenger trains is about 27 miles an hour, and freight about 16 miles an hour. Those are the result of computations I have had made, and they refer to the
1218 actual speed per hour when the trains are moving.

On this subject, I have caused the Library of the American Association of Engineers, in New York, and other libraries to be carefully searched and all discoverable information on these subjects extracted and furnished to me, I have caused the subject to be analyzed mathematically, I have discussed the subject personally with, and obtained all the information that I could from, a number of engineers who have devoted themselves to the subject of maintenance of way and to the strength and destruction of track structures, and I have come to my conclusion as the result of my own analysis from all of the information on the subject that I have been able to gain through these sources.

Q. Now another one of the elements which appears in the testimony in this case as causing the passenger mile to be more expensive is that greater refinements of track are necessary to meet the needs of the passenger service, in that the roadway and rails must be kept more smooth.

A. The point would be well taken if this were a road running fancy trains at high speeds, like the Lake Shore, but it doesn't run such trains. I think the point is not well taken on this road, given the speeds at which it does run its passeger trains; i. e., I think the necessary refinements of track required to prevent the freight traffic from being unreasonably destructive to the track are sufficient to provide for the requirements of passenger trains running at the speeds of the passenger trains on this road, which, as I have stated, average 27 miles an hour and exceed 40 miles an hour in comparatively few instances, and then only on short stretches of track.

1219 The Master: Would you say, then, that if there were no passenger service on this road, the road would have to be kept in as good condition as it is now, merely for the freight service?

A. I think substantially so; if not exactly, then very nearly so. It is the opinion of practical maintenance men whom I have consulted that up to passenger speeds of 40 miles an hour the condition necessary for the maintenance of the freight service is sufficient for passenger service.

Q. Another element claimed to make the passenger train mile more expensive is the super-elevation of the outer rail at curves to meet the needs of the passenger service, the elevation being claimed to be too high for the necessities of the freight service and so high as to cause extra damage to the curve and track by the freight train; what can you say as to that point?

A. I think the point is raised on theoretical, rather than on practical, grounds. It is manifestly true that where the outer rail is elevated for passenger speeds, and the freight trains run around the same curves at lower speeds, the freight trains tend to ride more heavily on the inner rail than on the outer rail. This riding on the inner rail manifests itself mainly in the imposition of greater weight upon the top surface of the head of the rail, which tends to cold roll the rail, and harden it, rather than to wear it. The fact is that the

greater wear of the rails on curves on this railroad is to be found on the outer rails, not on the inner rails, this wear appearing particularly at the inside edge or side of the head of the outer rail, due to
1220 flange cutting; this is caused by the tendency of the wheels and trucks to continue on the tangent rather than to follow the curve, commonly referred to as the "nosing" of the rail. The wear of the rails on curves, relatively to the wear of the rails on tangents, will average about as follows, namely, that the wear on outer rail on the curve will be about 20 per cent, and the inner rail five per cent, above the wear on the tangents, being a ratio of four to one of wear on the outer rail as against the wear on the inner rail.

Q. Would the elevation of the outer rail, be the cause of greater wear of that rail by freight trains, or would the wear be equal if there were no elevation?

A. If there were no elevation, the wear would be greater on the outer rail because of the tendency of the moving body to continue in a straight line. The car wheels are immovably attached to their axles and as the train passes around a curve the outer wheels travel over a greater distance than the inner wheels. The result is that one set of wheels or the other slips on the rails, and those wheels slip in respect of which there is the least resistance. The tendency, in the way the tracks are constructed, is for the wheels to slip on the outer rail, and to grind off the upper surface of the head of the rail and wear on the same caused by slippage, as contradistinguished from the flange wear on the inner edge of the head of the outer rail caused by nosing.

The curve causes the slipping; the elevation has nothing to do with the fact that slipping must take place; the slipping might be transferred from the outer rail to the inner rail, if the outer rail were depressed.

1221 It is generally considered better practice to elevate the rail for the maximum service. The elevation of the rail simply restores on the curves the level condition of the straight tracks; i. e., the two rails being level on a piece of straight track, and the outer rail being elevated on a curve for a speed of 60 miles, the effect then, as the train passes around that curve, is that the track is relatively level.

It is the practice, after the outer rail has become badly worn on the inner side of the rail head, to exchange the rails on the curve; i. e., put the outer rails on the inside and the inner rails on the outside of the curve, thereby getting the benefit of the unworn condition of the inner rail.

Q. Another element claimed to make greater cost per train mile for passenger service is the removal of snow; it is said that the needs of the passenger traffic, and the fact or claim that the road must be kept open for passenger traffic, necessitates the putting on of snowplows and keeping it open for the passenger service, when that would not be done for the freight service?

A. I do not agree with that. If the snow is permited to drift and pack in the cuts, the trouble and expense of removing it becomes much greater. Therefore, the economical method of removing the snow is to get busy with ths snowplows, as soon as it begins to snow, and keep the track clear. It is my judgment that the cheaper prac-

tice in respect to main tracks is to keep the snow off as it comes, and keep the road clear and open; that is the only feasible prac-
1222 tice, and would be followed if there were no passenger trains, if the highest economy were desired.

There is a good deal of work removing snow that requires to be done by hand, in any event, i. e., the removal of snow by shovel from the switch points and the frogs. This cost is greater in freight than in the passenger service, because of the greater number of switches devoted to freight service. It is greater also relatively to the train mileage.

Q. There is an element which has been claimed to make the passenger service more expensive, in that the trains running on a single track must pass each other; the passenger service, being preferred, the freight trains must take the siding and wait for the passenger, and that that expense should be borne by the passenger service. What can you say as to that?

A. I think the argument is a good one; I think it is sound, and remains a question of fact; I found that on this road it is a fact. Not all the delays occur for the reason that you speak of; there are delays of a contrary nature, although much less in number. I, however, recognize the fairness of this point, and computed the amount of delay in freight trains attributable to the necessity of granting superior running rights to the passenger service. I found that this amounted to approximately 2.75% of the running time of the freight trains. The result of my general study of the subject is that I think this factor is not sufficient to offset the contrary factors (elements of greater freight cost) and thereby cause the train miles to be a suitable measure of division of common expenses.

1223 Q. Incident to the freight train taking the siding for the purpose of permitting the two trains to pass, it is claimed that there is wear on the track structure and equipment and use of fuel. What can you say as to that?

A. This cost is a necessary incident of operating passenger and freight trains on a single track. It is manifestly necessary for one or the other of the trains to take the siding, but the costs incident upon its taking the siding are no more chargeable against the one service than the other; they should be equally apportioned between the two.

Q. It has been shown that a considerable amount of company material moves in freight trains, the exact extent of which is not shown. Are there any offsetting elements on the passenger side which would tend to equalize the cost of carrying company material in freight trains?

A. The cost of hauling expedited shipments of company material for use in freight service and in common service, which are carried in passenger trains; furthermore, the cost of hauling employes in passenger trains, to the extent that these employes are regularly employed in freight service or in common service. Free carriage of employes not on company business is granted by the company, because by such granting of free transportation it obtains the services of such employes at lower wages than it otherwise could, which is the universal reason advanced by railroad companies in favor of the

granting of free passes to employes and in favor of the exchange of passes with other railroads for their employes. Analogous, is the transportation of employes of other companies upon official
1224 business and on pleasure trips or their personal business, and also the free transportation of certain government officials in passenger trains, the same being a charge against all classes of service; likewise the transportation of officers of ele-mosynary institutions and the hauling of private cars of officials of this or other roads.

Q. Now, referring again to the question of speed, it has been claimed that the greater speed of passenger trains causes a greater impact on the bridges than the freight trains, and that there is a cost which is greater per passenger train mile than per freight train mile. Is that, in your judgment, true?

A. It is my opinion that the greater impact upon bridges due to greater speeds is immaterial, in respect of bridges of longer spans than 50 feet, but that, in respect of bridges of shorter spans than 50 feet, the increased dynamic effect attributable to speed becomes material, at speeds of 25 miles per hour. But, on the other hand, it is my opinion that the cumulative effect of trains composed of many units is greater than the effect in respect of shorter trains; that is to say, that the bridges are less affected by the impact of the wheels under short passenger trains than by the repeated impacts of the wheels under long freight trains, which latter not only cause a cumulative vibratory effect, but also cause an additional effect in that the repeated shocks overcome the inertia of the structure. The greatest impact is that of the locomotive; in the case of long freight trains with heavy loaded cars, there is a succession of impacts that sets up a cumulative vibratory effect.

Q. Are there, taking the other side of the proposition, certain elements or things which weight the freight side of the problem and which make the revenue freight train mile greater in
1225 cost than the passenger train mile?

A. I will state them, and having done so, I will explain those that you desire to have further elaborated:

(*a*) The greater tonnage of freight trains.

(*b*) The greater number of wheels and wheel impacts of freight trains.

(*c*) The greater weight, on the average, and the greater tractive force required, of locomotives of freight trains.

(*d*) The fact that wheels, trucks and parts are not kept in as good condition on freight trains as on passenger trains.

(*e*) The greater axle loading of freight train cars.

(*f*) The greater time through which the property is used by the freight trains, because of their lower rate of speed.

(*g*) The greater wear on track, both in the straight and on curves, attributable to the fact that freight train trucks are more rigid than passenger train trucks.

(*h*) The fact that a greater number of derailments and injuries to the track, ties, etc., occur in the freight service.

(*i*) The differences in the types of the passenger and freight loco-

motives. The principal differences in these, both of which tend on the average to increase the expenses attributable to freight traffic, are, first, the higher center of gravity of the average freight engine used on this road, which increases the rocking of the engine upon its springs and augments the dynamic impact upon the track, and second, the greater number of drivers in the freight locomotive, which produce a cumulative effect in respect of the dynamic
1226 augments due to imperfect counterbalancing and to the increased weight of side and main roads.

(*j*) The carrying of persons free by the passenger trains in respect of employes in both classes of the service, and also in respect of employes of other roads carried on exchanges of passes, and the free transportation issued for civic and charitable reasons.

(*k*) The hauling of business and private cars by passenger trains.

(*l*) The sustaining through the passenger expenses of services not remunerative in the sleeping and dining car service.

(*m*) The exclusive use by the freight traffic of large amounts of mileage of line, sidetracks, and spurs not used in the passenger traffic.

(*n*) The greater use of yards and terminals by the freight traffic in switching.

(*o*) The presence of some degree of double and triple tracking supplied to meet the necessities of freight service.

(*p*) The use of the main tracks by the freight service in switching operations, in greater proportion than in passenger service.

(*q*) The more frequent starting and stopping of freight trains in road switching.

(*r*) The fact that switching done by road locomotives is not represented by road train mileage, nor until one hour is reached in each instance does such mileage appear in the switching records.

(*s*) The fact that expenses which would peculiarly follow
1227 the train movement, and which have been allocated, do not follow the train mileage ratio.

(*t*) The expenses of the car accountant's office, which would follow the number of cars, rather than the road train mileage, and likewise the cost of inspection of cars at interchange points. Furthermore, although there are but 67 passenger cars, whereas there were 3,003 freight cars on this road, the expenses of the car accountant not only would not apply upon the ratio of the revenue train mileage but they are also greater per car for the freight cars than for the passenger cars, as the freight cars travel all over the United States, as it were, and have to be kept track of everywhere, and this is not the case in respect to the passenger cars.

(*u*) The greater length of passing tracks, which must be maintained to accom-odate the greater length of freight trains, because freight trains must pass freight trains as well as pass passenger trains.

(*v*) The greater cost of maintenance of the main line due to the frequent presence of freight switches. This also applies to common sidings from which freight tracks lead off.

(*w*) The greater number and the greater use of switches on freight sidings.

(*x*) The greater cost of switch ties, in connection with the use of switches for freight traffic only.

(*y*) The higher center of gravity of freight cars, and particularly of ore cars.

(*z*) The stational cost of freight movement, in the sense that freight cars are moved superfluously in the switching move-
1228 ment of other cars.

(*aa*) The greater damage due to track and equipment caused by the greater number of flat spots on freight car wheels than on passenger car wheels.

(*bb*) The greater injury to the tracks due to the reciprocating motion of the engine, sideways, which is caused by the fact that the power is alternately applied through the cylinders on the two sides of the engine, and this element of injury varies with the tractive effort expended by the engine, and is greater at slow speeds than at high speeds.

Q. Taking all of these things which you have said weight the cost of producing the revenue freight train mile, and taking into account also the things which are said to increase the cost of producing the passenger train mile, and which you have analyzed, which in your judgment is the more expensive revenue train mile to produce?

A. It is my opinion that the freight train revenue mile is more expensive to produce on this road than the passenger train revenue mile. I think it is considerably more than twice as expensive to produce the freight train revenue mile than the passenger train revenue mile.

The imperfections of the equipment devoted to the freight service constitute the principal cause of difference in expense, over and above the differences in the train weights. I think the element of train weights is the first main element, and that this element can then be multiplied by some of the other elements, of which the most important one in my opinion is the relative inferiority of
1229 design and of perfection of maintenance of the freight equipment. There are several such differences; the car wheels in the freight service are not run with their axles as nearly parallel as are the car wheels in the passenger service; that is to say, the freight trucks get out of square, as the Master Car Builders use the term, and the effect is to injure both the tracks and the wheels. The principal effect, however, of the trucks getting out of square is a great increase in the nosing of rails. The construction or the design of the freight trucks is inferior to that of the passenger trucks.

Another element which is responsive to the question is this: The wheels under the freight cars are all chilled iron wheels, whereas the wheels under the heavy passenger cars are mainly steel-tired wheels; steel-tired wheels are turned to approximately a true round, a true circle, but chilled iron wheels cannot be turned after chilling, and they are eccentric, they are egg shaped, and vary from a true circle. One of the principal deleterious effects of this varying from a true circle is that the irregular wheels are more apt to freeze in the brakes, and to slide on the tracks. This causes what are called slid

spots, both on the tracks and on the wheels, and produce- further injuries both to tracks and to equipment. Along the same line, although not directly due to the imperfections of the wheels, are the circumstances that the system of suspension on springs is quite primitive under the freight car and is elaborated under the passenger car, and thus the shocks both against the equipment and against the rails are greater in respect of the freight equipment, and that the freight trucks do not turn as readily upon the centers as do
the passenger trucks, this being due to two general causes,
1230 the first being that the construction of the passenger trucks at and near the king bolt is such that they revolve more readily, and the second being in the side bearings; i. e., the points where the sides of the car bear down upon the trucks when there is a list of the cars. The passenger cars usually have roller side bearings, whereas the freight cars do not, and it is of frequent occurrence that the loads in the freight cars shift and cause the freight cars to come down on the side bearings, and the result is that the freight trucks cannot swing as they otherwise would, and this increases greatly the nosing of the trucks under the freight equipment.

There are a number of items of cost in respect of which the relative costs attributable to the interstate and intrastate passengers vary, one with the other; that is to say, in some regards there are larger costs attributable to interstate passengers, relatively to passenger mileage, than to intrastate, and in others the reverse condition obtains. I think that the principal element of the addition to cost of carriage of interstate passengers and intrastate passengers, both relatively to the passenger mileage, is to be found in the conditions on the Western Division of the road, where the interstate business is much greater than the intrastate business, and where the total of the passenger business is light and the expenses correspondingly large. There are factors which go to increase the expense of intrastate or interstate business respectively, but the company has no records which would permit me to work this up. I did find, in examining the company's statistical records of passenger miles, that the average length of haul of the intrastate passenger was decreased, as shown by the records, below what it actually should have been in instances
where the same passengers and the same trip pays two fares;
1231 that is treated as two passengers making two trips. I also found that the average length of passenger haul was somewhat decreased by reason of the company's performing what is substantially a suburban street car traffic between Marquette and Dead River.

There are other items of expense which are relatively different in the two services, but in respect of which there is no record, as, for instance, the relative cost of selling tickets. There are more tickets sold per passenger mile in the intrastate traffic than in the interstate traffic. These tickets are largely card tickets, although card tickets are also sold in the interstate business, particularly between points on the company's own lines. The cost of selling interline tickets is greater in some respects than the cost of selling card tickets and interline tickets tend to be sold more largely in the interstate busi-

ness than do card tickets. The cost of accounting for interline business is considerably greater than for tickets for passengers on the company's own lines, alone, and these costs tend toward interstate and away from intrastate, business. There are a number of other items of this sort which are individually without great weight, and in respect of which the particulars for determining the exact facts do not exist, because in order to determine such facts an accounting of the statistical system will have to be devised in advance in such a manner as to reflect these facts, and to allow an analysis thereof.

Q. And I gain also from what you have said that you think the excess cost in interstate passenger business on the Western Division would offset any possible excess of cost in intra passenger business on the other division.

1232 A. I think that, in view of the expenses that have to do with more expensive car service (sleepers and diners), the item of excess would be offset.

The Master: Is it your judgment that the expense of the interstate passenger on the Western Division is greater than the expense of the intrastate passenger, based on any capitalization?

A. Yes sir. The effect of a greater volume of traffic in a particular service is to produce less cost per unit relatively to the cost upon a smaller volume of traffic.

Q. What, in your judgment, is the proper method to be applied in dividing the commonly-used property between passenger and freight services?

A. I think that the capital division, or the division of capital invested in the property respectively against different traffics, as for instance, against passenger traffic and freight traffic, should be made upon a basis of the use of the property by the several classes of traffic, in point of time. I am speaking now of property used in common. I think the capital should be attributed to the several traffics in respect of time through which these traffics avail of the use of the common property.

THOMPSON.

Cross-examination.

By Mr. Butler:

On the subject of division of costs between passenger and freight, the Interstate Commerce Commission has no complete set of rules or regulations for the ascertainment of passenger cost; it has some rules which tend to a partial determination, being the classification of accounts, but they do not enter upon the problem of ascer-

1233 taining passenger cost or freight cost at all.

I was employed in this case a year ago last winter, and have had charge of the accounting features of the defense in respect to the separation between passenger and freight costs.

I gather that Henry C. Adams entertains the opinion that the cost of doing the intrastate passenger business in Michigan cannot be assigned with any reasonable degree of approximation, but I disagree with him in that. I do not entertain the view that it can be

shown with certainty, particularly upon the basis of the accounts as kept by the company. I think that, were the accounts designed in advance for the purpose of making such a showing the showing could be made with substantial accuracy. The term "arithmetical accuracy" I undertsand to designate accuracy within maximi and minimi in respect of which the variation from absolute accuracy would be immaterial.

I think that, if there were no legal complications that affected definition or constructions of the components, it could be done. I do not hold to the view that I can do what I have undertaken to do here with arithmetical accuracy. I think the general opinion among railroad accountants is that the thing cannot be done at all; mine is that it can be done with sufficient accuracy for the purpose of litigation of this character.

I do not intend to imply any adverse criticism of the manner of keeping the accounts of the plaintiff. I think they are well kept in accordance with the orders of the Commission. I had full access to all the records of the company, and obtained every-
1234 thing I asked for that they had. I never asked for the keeping of any accounts or the installation of any system for the purposes of my work, as I did not conceive it to be within the purview of my employment to ask to have particular accounts kept.

I should think that the aggregate time spent on this case would be the equivalent of the labor of one man between two and three years, including myself. My services were particularly as an accountant, but in this particular kind of work it required what may be called engineering accountancy also.

The density of traffic has a bearing upon cost per unit, and, in a general way, I have looked into some of these figures. I am of the opinion that the density of traffic on the South Shore road is light when compared with the St. Paul and the Northwestern, and Michigan railroads generally.

I have not looked into the traffic density; the question is too general to be answered. It bears upon the cost per unit and is a most important consideration. That is true both as to freight and passenger. The number of persons per passenger car and per passenger train on an average is important.

I think that in determining the cost of transporting intrastate passengers on this road in Michigan the density of traffic on some other road is utterly immaterial. The density of the freight traffic on the South Shore road might be material in determining the cost of the intrastate passenger business. It would depend upon where it
was. The general effect would be that the great density of
1235 freight business would reduce the cost of passenger business, but I am hardly prepared to testify as to universal rules.

There are some items of cost which properly should be divided between passenger and freight on the basis of relative amounts of passenger and freight business; so with the interchange item of cost, the road with the greater density of freight traffic in its cost account should assign a larger portion of this interchange item to freight than to passenger.

I ascertained the density of the freight traffic of this road, and the earnings and tons moved, and tons per mile, but I did not take

the trouble to make a comparison. It was immaterial in my work what other roads did.

I have had nothing to do with matters of earnings, but have reported solely upon matters of cost. I was not asked to determine that point, and paid no attention to it. I have made no attempt to testify to determining the earnings from any class of traffic. I have devoted myself solely to costs, and I did not require to know earnings to determine costs. The matter of earnings has been one of indifference to me. The costs are not dependent upon earnings.

I have discovered the general fact that the dining cars are operated at a loss. I cannot tell you the figures; I do not know, and cannot approximate it from memory. I testified to a distinct loss on dining cars and sleeping cars and mail and express.

I do not regard the cost of haulage of the mail or express or sleepers and diners as one of the component parts of the cost
1236 of transporting intrastate passengers. My figures are all based on that hypothesis, and I have apportioned cost to those dining and sleeping cars. I think that should be paid for; I do not think it is included in the rate of fares, so much a mile. I have included it within the general cost of passenger business, but I laid it aside in respect of the cost of transporting intrastate passengers in Michigan in respect to a given rate of fare per mile, because I considered that it has no relation thereto. I think the people who ride in the sleepers and diners should pay for it, but not as a rate per mile.

I did not undertake to say that if this company discontinued its dining and sleeping car service it would save out of the operating expenses the whole $112,603, or what part could be saved. I have no opinion on whether this company ought to do any such thing as that, as a business proposition. I do not know that, if it did do that, its other expenses would not greatly exceed the $112,603, for eating houses, delayed trains, stopping for people to eat, and running in the day instead of at night. I did not indicate the view that the company ought not to have the services of dining and sleeping cars.

I should think that the sleeping car rates probably were low. I think they are as high as similar rates in the vicinity. Nothing came to my attention to indicate that they were lower than they ought to be, or that the charges in dining cars were lower than they ought to be. If they abandoned the dining cars, I think they would have to stop the trains to feed the people. I intended to suggest that I think the custom of running expensive dining cars, and serving meals in imitation of expensive restaurants, is a wasteful practice in railroading, in general. As to sleeping cars, I think the rates are too low, generally, in the country.

1237 I think that the difference between transportation charges, as stated, and sleeping car charges as stated, leaves the sleeping car charge too low. I cannot say that the charges for the service of passenger trains, including the sleepers, diners and transportation, are too low generally in the country. My expression in respect to the rates of sleeping car fare was directed toward the general subject, not upon the South Shore road, and what I volunteered had to do with the general subject, and not with the South Shore.

I have endeavored to do what I was employed to do, namely, discover the cost to the plaintiff of transporting interstate and intrastate passengers in Michigan. I eliminate from that cost the cost of the dining and sleeping car business.

I do not think I should exclude the proper portion of the dynamo cost, to light the train. If the dynamo was used in part to drive fans and for lights in all the coaches, and in part to drive the fans in the sleeper, I think it well might be subdivided between them. I think all the expenses of the sleeping cars should be charged against the people who pay for sleeper accommodations.

Q. Let us now speak generally of railroad business: Assume that, by an increase of the service, expenses would be increased a given sum, which we will say is X, but revenue would be increased twice that sum, 2 X; can you tell us on that whether or not the increased service resulted in a profit or a loss?

A. In general, I should imply that the increased service would result in a profit. I think that the question is not as simple as it appears on its face.

1238 I find the 1912 expenses of the sleepers and diners to be $112,603. Complt.'s Ex. 48*a*, Delf, sheet 2, shows it to be $55,180.43. I make no attemp- to show whether it results in a net gain or loss. The reason for my increased cost over Delf's comes from apportioning common expenses to the sleepers and diners. If I was wrong in my assumption, that the expense of the sleepers and diners ought not to be taken into account, but in truth and fact it should be taken into account and all treated as a passenger charge, the result would be very much more favorable to the company.

By my plan of apportionment I take out of the passenger operating expenses $112,603. If I left it in, the operating expenses of the passenger business would have been increased that much. I don't know whether or not that might control the decision in the case. I have directed my attention at finding out as nearly as I could what the cost was, regardless of the result.

Whether or not there be precedents for this deduction I cannot say; I did not attempt to look them up. It seemed to me to be a matter of simplicity. I do not know of any accountant that ever did any such thing, and do not know of any court that ever held any such doctrine. As to whether any commission ever held any such doctrine, directly or impliedly, I remember that there was a very considerable argument in the conference between the Interstate Commerce Commission and the accountants representing the railroads in respect of the proper basis of casting up sleeping car and dining car expenses, and my recollection is that the results adopted had to do solely with the conformance by the railroads to the customs that the Pullman Company had set up for itself as a matter of convenience. As far as

1239 I know, that idea is a new idea in this problem; never before put forward in any litigation, rate hearing or controversy that I know of, and so far as I was guided in arriving at this decision, I arrived at it myself.

All questions that came up in connection with this work formed a subject of discussion between myself and all of my assistants, and it

would be impossible for me to say at this date who originally suggested one or the other. I cannot tell who invented the idea. It may have been me, and it may have been some of my assistants; it was not any of the lawyers in the case.

In arriving at the cost of Michigan intrastate passenger business, I necessariiy had to examine into certain of the ore costs. I did not report on it, further than as contained in my Defts.' Ex. 72. I did not attempt to separate interstate and intrastate freight in Michigan, or between Michigan and out of Michigan. I made some attempts to examine Mr. Delf's work, but the amount of it was so great that I never was able to get all through it.

I read Mr. Adams' testimony with care; I don't know that I said I did this with approximate accuracy. I said that I did this with approximate accuracy in view of existing records; that is an entirely different story.

I would not go beyond saying that, given such accounts as the company had as a basis for me to go on, I think my result is as near right as could be had; what I mean is, I did the best I could with the material at hand.

I did not set aside the expenses of the dining and sleeping cars on the theory that the intrastate passengers did not eat and sleep
1240 in them; I did it on the theory that they should pay for those services specifically, and not as a part of their transportation rate. It is not for me to say they should pay enough to cover the amount of expenses I have apportioned; that is a matter of company policy.

Upon whether they ought to pay enough to pay operating expenses and a ratable portion of the profit, I haven't any opiniou. I set aside this $112,000 because I don't think that the cost of operating sleepers and diners is a part of the service for which the passengers pay when they buy a ticket to transport them between two points. They have to pay for their food and for their sleeping besides. My idea is that it is not a proper incident to the passage.

I am trying to produce a cost account, and that is all, and I said that this was not a proper element to take into consideration in this rate case, to test these rates.

Reading, as I have for the first time today, my testimony on that subject, I think perhaps it would be suitable for me to leave out my remarks about a given statutory rate of fare, and amend my answer to say that I do not regard the cost of haulage of mail or express or sleepers and diners as any component part of the cost of transporting passengers; that has to do with the rate per mile of passenger fare paid by them. I have not attempted to express my opinion that the service of dining cars or of sleeping cars on this road should be discontinued. If they discontinued the dining car and sleeping car in this territory; I take it, as to their passenger business as whole, that they couldn't do it. I am not expressing an opinion as to what would ruin them. I think it would be bad business.

1241 The Master: If it would, then the expense of the diners and sleepers would be a necessary part of the cost of transporting passengers?

A. No, sir, I don't think so at all.

I suppose they have newsboys on their trains, I cannot remember any activity that the company has exerted in that respect, other than to let out a contract to a news company. I did not undertake to ascertain what proportion of the total expenses of the passenger department should be assigned to the space and weight occupied by the news agent. It might be done. That is not a proper expense to include, to ascertain the cost of hauling intrastate passenger; it should be charged against the revenue derived from the sale of news.

I hold that the diners, the sleepers, the newsboy, or the expense of maintaining these or rendering this service, ought to be excluded. As to the dynamo that furnished the fan, in the coach, I should think that the cost of that would probably go along with the cost of maintaining the springs underneath the coaches for the comfort of the passengers, and as to the plot of grass by the station at Marquette, I think that is largely a question of company taste. In such matters as cost of mowing and keeping the grass clean, I haven't attempted to cast up the propriety or impropriety of the acts of the management of the company, but have taken them as I found them, and have endeavored as best I might to put them in a proper position.

Ratio 4 is a time ratio; it expresses a relation of the time that the freight trains are running to the time that the passenger trains are running. I take into account that they stop to take on and let off passengers while en route, and compute time from terminal to
1242 terminal; that is, from the beginning to the end of the run. That is also true as to freight trains, with the exception that, in respect to delays of freight caused by meeting passenger trains, that time has been taken out.

I took the total time from the beginning to the end of the run on the assumption that the amount of track respectively relegated to the use of a passenger train and of a freight train over and above the amount of track actually under the train was the same. I assumed the passenger train would occupy the space between two passing tracks, except in those instances where a passenger train leaving a passing track in advance of a freight train, it would be followed by the freight train, and I computed out mathematically the effect of that relation and found it did not change the original assumption by any material amount, and the same as to freight. That is, it was from passing track to passing track, and that distance would vary on different parts of the line; I assume that it averaged. The length of the train or the weight of the train cuts no figure; the speed of the train does. A freight train making a hundred miles in 10 hours, which is the standard according to the wage schedule, would occupy the track or be entitled to twice the allowance in getting this ratio that the passenger train would that made the run in five hours, eliminating this allowance that I have made.

That factor (4) was used by me to apportion certain common expenses between the freight department and the passenger department; generally speaking, that class of expenses were those not caused by mechanical wear. Expenses due to mechanical wear I divided on an-

other basis defined as Ratio one. The time ratio was used to apportion the weather stress items between the two departments.

1243 I didn't group decay and obsolescence together. I apportion obsolescence to the two departments of service on the basis of wear. I think that in that respect my apportionment of the accounts of depreciation is subject to criticism, but such information as I had at the time when I cast up those figures led me to believe that the depreciation charge on this road reflected wear, rather than obsolescence, and I did not find it convenient to attempt to analyze into those figures and see whether it would be requisite to change the basis that I used in respect of the assignment of depreciation charges from wear to the time element, and the reason that decided me not to attempt that labor was that the difference in the result which would have been produced would have been immaterial, according to my figures. It happened by accident my time percentage and my wear percentage were the same, so it didn't make any difference whether I made a mistake in principle or not. I discovered after I had cast up my original figures that the company was making some replacements of equipment, apparently because of obsolescence rather than destruction by mechanical wear, and had it made any material difference in the result I should have recast the account in that respect.

I am of the opinion that the expenses due to obsolescence, including inadequacy, should be divided between the freight and passenger business on the time basis. It was wrong in principle not to apply the time basis to obsolescence and inadequacy. I want to point out that the accounts of depreciation do not make it clearly determinable what portion has to do with one or the other, so I didn't have the bases.

1244 The result expressed in figures is that, if the freight trains on the South Shore ran faster the passenger business would cost more directly in proportion, as the speed of the freight trains was increased, the cost of the passenger department would increase. If the power of the State would compel this company to run its freight trains slower, they could thereby reduce the passenger rates more than they otherwise could; it might seem to have that effect. It perhaps might have the opposite effect elsewhere. So far as common expenses are concerned, that have to do with time ratio rather than mechanical wear, that would be true.

For the purpose of illustrating the application of this Ratio 4, following your assumption that there was a snow storm and that $100 was expended by the company in snowplow service to clear the main line for use of revenue trains, that a passenger train followed immediately after the track was clear and made the 100 miles in 3½ hours, and a way freight following along after it made it in ten hours, 3½ of which was standing on the main line and loading and unloading freight at various stations of way freight, this method then would charge about 35/135ths, or $26, to the passenger train, and the balance to the freight train. It would charge as much to the freight while it was standing in front of the platforms as I charged to the whole passenger run—3½ hours. I think that is a correct cost accounting principle. So far as I know, or knew at the time, I originated that scheme, but I afterwards discovered that it had been in-

dependently originated by Prof. Friday. I think Friday invented it in his own mind at sometime unknown to me. When I told him about it he told me that he had thought of it. I was delighted to find such intelligent support. I don't think it has ever been employed in a case before, but I am satisfied that the principle is irrefragible.

We will say that on a hundred miles of road there are 10 crossings guarded by flagmen; if a passenger train ran the hundred miles in 3½ hours and a freight train took 10 hours, that block of ex-
1245 penses would be divided about $26 to passenger and the rest to freight. As to these items which I divided on the time basis, neither the length, weight or consist of the train makes any difference; if the speed of the freight and passenger trains was the same, a straight train mile basis would be the same as the time ratio.

I determined the proportion of the time use of each to the sum total of the two. The sum total of the two is not the sum total of time through which the tracks might carry trains. The difference between the sum total and a possible total is waste, and I apportioned the waste on the same ratio as the actual use. I don't know how much of the time was waste and how much actual use. It cannot be ascertained from the figures I have. I thought of the matter very carefully, and I concluded that, as it was my intention to apportion the wasted time upon the same basis as the utilized time, it would be wasted labor to discover the actual or definite amount of utilized time and wasted time.

Ratio 4 expresses the relation of the time used by passenger trains of 29.12%, and freight of 70.88%, to the total time used by passenger and freight trains. Freight trains, total time of occupation for the year, 4,630,398 minutes, being 70.88% of the total; total time in minutes 6,532,075. The periods of observation are the first seven days in each of the months, July, September and November, 1911, and January, March and May, 1912. I did not make the experimental determination of how much the tracks would hold.

The unit of occupation varied according to the distance of the passing tracks from each other, in individual instances; I assume that the average was the same where one train would be in a longer stretch at one time and another time would be in a shorter stretch, or vice
1246 versa. I let it stand as it was; it made no difference. I took the elapsed time, on the assumption that they were the same; it was unnecessary to use a multiplier. I never heard of the method being used except by me. It is one of my most important ratios here.

The actual number of passenger train minutes during the 42 days in question was not 1,901,677, but was as a matter of fact 234,543. That number of minutes last stated was divided by the number of train miles corresponding to the same period, to produce an average time per passenger train mile of 2.49 minutes. That average time per train mile was then multiplied into the total number of passenger train miles, giving a total of 1,901,677 miles. In respect to the freight trains, the computation was made in the same way. What I call minutes was a computed number of minutes per mile, multiplied into the total number of train miles. The number of passenger train minutes during the 43 days was 234,543.

That figure, divided by the total number of minutes in 42 days, which is 60,480, gives approximately 3.85 train minutes, per elapsed minute. It is an average of four trains over all the track; the figure is a statistical average.

I find that my sheets do not show the number of trains; they show the total number of miles of passenger trains which ran during each day on each division, and the elapsed time consumed. I did not observe trains at all; I took these figures from the dispatcher's daily report to the auditor. I made observations concerning trains moved by the date. I cannot tell you how many trains were moved on any day.

The figure, 1,901,677, is derived by the application of the total train miles of passenger trains in Michigan, D. S. S. & A. operations, which was 723,874 train miles, to the average time of 2.49
1247 minutes per train mile, to produce the result of 1,805,342 minutes of track occupancy, to which last mentioned figures there was added a similar figure in respect of C. & N. W. and C. M. & St. P. operations on South Shore tracks and obtained in a like manner, producing a total for the last mentioned subdivision of 96,335 minutes, which, added to the previous total, gives 1,901,677 minutes of passenger train occupation on the track. That covers a period of one year, through which 723,874 train miles of D. S. S. & A. trains were made, and 31,325 train miles of St. Paul.

I have arrived at the conclusion that the passenger train occupancy of the track in minutes was 1,901,677; if we divide that by the number of minutes in 365 days, that will give us the number of trains on an average for the year, which is slightly less than 4. This Company had only four passenger trains occupying its track in Michigan on the average each day of 24 hours in 1912. If the trains were only on the tracks half a day, there might be eight trains running 12 hours, making four trains 24 hours. Approximately 8.85 freight trains on the average per day. That is on the assumption that these 42 days represent a fair typical average of all of the time. It would be right to call the space between passing tracks the unit of occupancy. The units of occupation, or the distances between the passing tracks, vary in length. My recollection is that the average distance is, between passing tracks, about six or seven miles.

I assumed that each train, freight and passenger, occupied the same space on an average. Sometimes it may be said that trains occupy more than one stretch. On this road, the traffic is not sufficiently dense so that this suppositious case would be of great weight. Compared with such roads as the Michigan Central, density
1248 of train movement is light. Compared with some divisions of the Pere Marquette, I should say it is not. I do not like to make a general comparison. The train movement on the South Shore is light compared with some divisions of the St. Paul, and it is not light as compared with others.

I think it is obvious that there is lots of room for more trains on the South Shore road in Michigan, but could not give you any opinion about how many the road could accom-odate. I have no

doubt that it could accom-odate twice as many, but to take that proposition and continue it and say it could in turn accom-odate 3 times, 4 times, 5 times or 10 times, as many, is a proposition I am not going to attempt to answer without studying that problem itself.

I did not know how much waste time there was and did not even form an opinion as to whether there was two or ten times as much waste time. I have divided my waste time on the basis of the used time. I think there is but one sound view on that subject, which is universally held by cost accountants, namely, that, in respect of discovering costs in the past, it must be done, and I have done it. So far as I am aware, the subject of waste time has not been generally carefully examined into by those who have made computations of this sort. So far as I know, the problem has not come up until I, myself, brought it up. I never conferred with any accountant on the subject outside of my own force, except Mr. Friday. Mr. Friday, who worked on this case under Dr. Adams, when I stated to him my own views in respect of time use or occupancy of the tracks, stated that he, himself, had independently come to the same view before I spoke to him about it, and that it had been suggested to him by reading your (Mr. Butler's) brief in the case, page 41, in respect
of the exclusive use of the tracks by the one service or the
1249 other. He entertains the same view about dividing the waste
time that I have applied here. This time ratio was never used before, so far as I know, except that there is something in the Minnesota Rate Cases, in the decision of the Supreme Court, that might indicate that the Court had something of that sort in mind.

For each $100 of fencing that is spent, I charge the freight $70.88; that is true for expenditures for watching crossings, bridges, work about the embankments, cuts, ditches, drains and maintenance of crossings and crossing signs, and it becomes an element in the factors used for the division of superintendence, etc., so it has much to do with my result. It would not require a great deal of research to ascertain just to what extent the use of this factor affected my result. This ratio of 29.12 to 70.88 represents the elapsed time, rather than speed, between termini, of the passenger train to the freight train. It follows that, if passenger trains would go slower, their operating cost would be more. If you abandon the dining cars and stop the trains to let the passengers eat, it would not increase expenses for keeping up the fences. If the passenger trains occupied more time and went slower, stopping for the people to eat at the stations, it would thereby cost the passenger business more for keeping up fences, cleaning out ditches, putting in bridges, watchmen at crossings, superintendence, stationery, and all the other things into which this time enters as an element or a factor for division; that ratio, arrived at by comparing the time or speed of the different classes of trains, does not take into account the weight or the length of the train, except as those affect time in transit. According to this scheme, out of $100 for fences, $29.12 charged to the passenger business.

1250 I charge some of that to mail and express, according to Ratio 3, passenger train car miles in Michigan, and the sundry sugdivision- thereof. So of that, $29.12, I would set aside to mail and express about 14½% and 26.36% to sleepers and diners. Ratio 3 was intended to be the nearest approximation to a time ratio that could be had. I insisted that the apportionment between those three classes must be made on the basis of time. The mail and express car and sleepers and diners make precisely the same time over the road enroute as the rest of the passenger equipment. The ratio between different parts of the car is the ratio of the linear space of the two ends of the car, or two needs of the car, one to the other; that is a time ratio in respect of the problem under examination. It is a car mile and a space ratio, and becomes for this portion of the problem a time ratio. The car mile basis, when it comes to the division between passengers and baggage and mail and express is called by me time, and the car mile basis is the right basis for that division.

In the classification of accounts by the Interstate Commerce Commission hitherto, dining cars and sleepers have been classed as outside operations, and the South Shore has followed that classification. Assuming sheet 2 of Complt.'s Ex. 48*a*, Delf, to be correct under the classification during that year, operating expenses were $55,180.43. It was only the net that was taken into account, $1,413.48. That is, the operating expenses of the company, when stated, would not include these operations. In my work here, I have ascertained the cost of sleepers and diners at $112,603; that should be added to the $55,180.43. My figure has to do with the transportation and maintenance expenses, etc., of sleepers and diners not included in

1251 outside operations. I do not claim that if the Company did discontinue the service they could save the $167,000 in operating expenses. Undoubtedly there would be some considerable saving, as to fuel and such things, but whether the total saving would equal the revenue shown on Delf's Exhibit, $56,593, I cannot say. I would not expect it would amount to that much. I think that, leaving things as they are, all other things being equal the company is as well off by continuing the dining car and sleeping car service as it would be if it discontinued the service. I think it would be very foolish and absurd business policy for it to discontinue the dining or sleeping car service. Undoubtedly, the competition, even in some parts of the northern peninsula, is very active. The principal points served by this road in Michigan are the points in the Copper and Iron countries, and they are highly competitive to the C. & N. W. and C. M. & St. P. but they are mostly monopolistic to the South Shore. The South Shore monopolizes the business at its own end—the business that moves from Detroit, for example. The Northwestern is a pretty strong competitor to the South Shore, or the St. Paul and Michigan Central. The whole territory up there is in competitive territory, both freight and passenger In respect of general competitive conditions, it is true that there is competition although the territory of the South Shore itself is in good part non-competitive.

Marquette is hardly competitive, except for steamboat traffic in summer, so far as passenger business is concerned. I should expect that freight rates are controlled by competition, and measurably, passenger rates. I think that if the company would suspend its dining and sleeping cars it would be a losing proposition.

1252 Mr. Butler reads "Classification of operating revenues and operating expenses of steam roads prescribed by the Commission. Issue of 1914, effective July 1, 1914." The introductory letter contains this paragraph: "Accounts are provided in this classification for the revenues and expenses of operations which heretofore have been classed as auxiliary or outside operations. The purpose in merging these accounts has been to secure a statement of revenues and expenses in connection with the operation of all physical property, the cost of which is includable in the accounts for investments in road and equipment."

It is becoming quite customary in this country for railway carriers to furnish dining and sleeping car service, and it has become a usual incident of transporting persons that way. It is a necessary incident of the service, in view of the state of civilization and the public demand.

I think the sleeping car fares are too low, generally speaking. The railroad companies should have the money, instead of the Pullman Company. What I mean, of course, is that, if the rates were raised to $5, I did not think the increase should go to Pullman; it should come back to the railroads, for their cost of hauling the cars. I think, generally speaking, that rates of sleeping cars should be raised in this country. I have not any opinion as to the general propriety of raising or lowering passenger fares. It is only sleepers and diners that I want to express an opinion on. I agree that sleeping and dining car service is a necessary incident of the transportation of persons for hire by rail, and I express the opinion that the charges were too low. I do not think that I am competent to answer as to whether a two cent passenger rate is too high or

1253 too low on the South Shore road.

I haven't examined into its mail and express rates. I paid no attention to revenues whatsoever. I did not separate the cost between the sleeping and the dining cars, so as to show the cost of each. I don't think that they are a necessary portion of that service which is to be given to the passenger for the fare he pays for transportation between two points. Nobody else does either. I excluded it because I think that is something that should be paid for separately and its cost should be charged against the separate payment, but I do not undertake to say, as a practical matter, that this company could make charges which would give it $167,000 and more. That is its misfortune.

A person engaged in any large business, like a factory or a railroad, is justified in taking on an incidental business whenever the returns exceed the increased cost. That is probably a rule that is generally good. I would say that the principal business of the South Shore road was the transportation of freight and persons for

hire, and that the transportation of mail and express was in a sense incidental to it.

Q. And would you also say from your knowledge of such matters that the increased cost of hauling the express and mail matter is very slight?

A. I hardly like to subscribe to that. People take on new units of business on the theory that it doesn't cost much more to handle, but when they get through they find it has borne its share of expenses. I do think that the mail and express business increased the cost of operation of the passenger trains of the South Shore; I don't know how much; I haven't endeavored to find those things out. I have made no attempt to determine the increased
1254 cost due or chargeable to the mail and express business over what the cost would be without them.

So far as the records furnished the information, I can state approximately what it does cost to haul mail and express and what proportion of the total cost is justly assignable thereto. Assuming that the records are true, insofar as they purport to be true, my results are true, so far as the records are responsive to furnishing information required to be had. They are not directly responsive to the cost of hauling the mails at all, only upon sundry computations.

I assume, and have no reason to doubt, that the things that are marked down in Mr. Delf's records are true, but the situation is not analyzed, or the scheme of accounting is not made as I would make it, to ascertain the cost of mail or express. I don't know what I would do to have the books kept in such manner as to show the cost, but, so far as the books are responsive to digging out the truth I think I have got it approximately correct; so far as they do not afford the basis for a correct computation, to that extent my computation is in error.

I say that they may or may not be true. I further say that they are as near the truth, approximately, as can be learned from the existing records, and the existing records are the only evidence of what has happened. I also say that the existing records were not kept so as to enable anyone to ascertain the truth with precise accuracy with respect to the subject. I now say that in some regards I think my conclusions are approximately correct, and that in other items I couldn't say. I did not mean in respect of any one account; I meant this or that stage of process. The mail and express
1255 is all carried in baggage cars. They would have to provide space at any rate for the baggage.

I suppose, in a sense, this mail business is kind of incidental to the main business, but, since you began talking about incidental businesses, I find it rather difficult to give my assent to the notion that the railroad is run for any one particular business; I think it is run as a composite for all of the businesses—freight, passenger, express and mail.

I think there is no ratio I have used that is established with mathematical accuracy. In my scheme of apportionment, especially of maintenance of way expenses, mechanical wear expense is divided

on methods different from the expenses due to other causes. It is impossible to tell with accuracy what is due to mechanical wear, and what is due to ballast or decay. I classified according to where the majority of the dollars fell; if the majority in a single item fell to wear, I classified one way, and, if to the weather side, another way. There is a great diversity of opinion as to what proportion is weather stress and what proportion is wear; Ratio 2 is founded on the proposition that it costs three times as much to maintain one track as another. Ratio 2 is important, because it has the effect of taking out 13.32 per cent of maintenance and it is quite important to know whether that is arrived at correctly. I took the basis from an exhibit of Mr. Riggs.

The increased cost to the company of hauling its employes free on its passenger trains over what that cost would be if they didn't haul them, I don't think is a figure susceptible of determination at present. Cost accounting might reach it, but I don't think
1256 the figures exist here to show it. That comes under the class of things which you start in by saying "it doesn't cost any more;" finally when the facilities become more or less filled up, it requires more facilities and does cost more.

I think that on the average the cars were less than half filled, including the help that is hauled free. I haven't investigated whether it increases expenses any substantial sum to haul its employes in its regular passenger trains free. It is not trifling with common sense to say that there is a substantial element of expense in permitting the employes to move from place to place upon the trains, any more than the similar trifling with common sense, to offset which, that element of cost was brought out *be* me. I am rather disposed to think that there has been a great deal of attempt to make hairs into tons. I don't think it is a humbug to claim that it costs anything to haul coal, ties, timber and supplies that are hauled on revenue freight trains, to operate and maintain the road.

Q. Did you give the reasons specified and lettered *a*, *b*, *c*, etc., as reasons why the total train mile cost of the revenue freight train was greater than the total train mile cost of the revenue passenger train, as the language purports, or did you mean that the proportion of common expenses of the freight was greater than of the passenger, for the reasons enumerated?

A. I meant the proportion of common expenses, of course.

Q. I observe again this question: "Mr. Thompson, taking all of these things which you have said weigh in the cost of producing the revenue freight train mile and taking into account also the things which are said to increase the cost of producing the passenger
1257 train mile and which you have analyzed, which in your judgment is the more expensive revenue train mile to produce?

A. It is my opinion that the freight revenue train mile is more expensive to produce on this road than the passenger train revenue mile.

Q. Have you any judgment as to how much more?

A. I think it is considerably more than twice as expensive to produce the freight train revenue mile than the passenger train revenue mile."

A. At that point I mean in respect to the division of common expenses. I was answering questions that counsel asked me, and did not then, as I sometimes do not with you, see all of the things that might bear upon it when it has been running along on a particular line.

Q. Now, if that is true, what relevancy to the subject does the reason (*n*) have? The reason is "The exclusive use by the freight traffic of a large amount of mileage of line sidetracks and spurs not used in the passenger traffic."

A. The relevancy of that is that the question, as I understood it, was directed, not to my own computation, but to Mr. Delf's computation, in which he had treated as subject to a division as common expenses some things which I myself had laid aside and excluded.

Mr. Wykes: Those all appear in the common expenses.

Q. Reason *l*, "the sustaining through passenger expenses of services not remunerative in the sleeping and dining car service?"

A. That also was directed, as I say these questions had to do with the division on the train mile basis that had been made by Mr. Delf, in which he included as common these expenses you just mentioned.

1258 Mr. Butler: I offer in evidence the Classification of Operating Revenues and Operating Expenses of Steam Roads, prescribed by the I. C. C., effective on July 1, 1914. Marked "Complt.'s Ex. 94, Thompson."

I do not recognize that a revenue train mileage basis might be a proper basis for the division of the common maintenance expenses on other roads and in other cases. I can conceive of a case in which it would chance to bring out the same result, but that would be a mere coincidence. I think it is no measure of the fact, and is not supported by reason. I think it would produce a highly inaccurate result. I do not intend that all of these alphabetical reasons have general application to all of the items.

Q. These reasons are not alleged as reasons why you did not use train mileage on the basis you analyze this proposition, but are alleged as reasons why it was wrong to use train mileage as the company used it, is that right?

A. I think both. They are advanced as reasons why it was improper for the company to use the train mileage basis, and why it would be improper for me to do likewise.

Q. You think it would be better, do you not, to separate the terminals from the line and divide the terminals on the best basis you could and the line on the best basis that you could?

A. I think so, yes.

Q. And that the adding of switch engine mileage to the train miles, well, it is scarcely logical anyway is it?

1259 A. Well, I think in respect of that last point that it would tend to reduce the error which would be involved in using the line train mileage only—this switching mileage for the freight exceeds the switching mileage for the passenger almost uniformly.

Q. So then it follows, I take it, that you are of the opinion that the train mileage basis assigns too much of the maintenance expenses to passenger, and that if you would add the switching mileage it would reduce the error; that is the idea that I gather?

A. I think it is extremely rough in either case, but I think in the present case the addition of switching miles would tend to reduce the error.

The expenses of the car accountant's office would follow the number of cars rather than the road train mileage, and likewise the cost of inspection of cars at interchange points. Furthermore, although there are but 67 passenger cars whereas there are 3,003 freight cars on this road, the expenses of the car accountant not only would not apply upon the ratio of the revenue train mileage, but they are also greater per car for the freight cars than for the passenger cars, as the freight cars travel all over the United States and have to be kept track of everywhere, and this is not the case in respect of passenger cars.

I found car accountant's expenses included within general expenses, and I subdivided general expenses upon the basis of an average of all of the previous determinations. It might not be exactly right, but the margin of error would be reduced. If I was wrong in all my previous determinations, the extent of error therein and thereby would be increased.

1260 When you speak of accuracy I am not quite sure, and you have apparently used the term in different ways, and I want to be sure that I get myself properly understood by this Court. When you say accuracy, if you mean absolute correctness, in terms of five dollars or one dollar or one cent, then I answer that I do not attempt such accuracy, but if you mean accuracy in respect of substantial accuracy, and a minimum degree of variation from error, then I say that my results are substantially accurate. Percentages of variation that my be included within accuracy would vary in different items. My limit is the nearest determination of the fact that can be made from the existing records. That is the best possible then. Substantial accuracy means the best possible.

So far as the engine alone is concerned, I think the wear on the ties increases materially at speeds exceeding 40 miles an hour; I think at speeds below 30 miles an hour the difference in speed is not material in respect of the wear. It would be a greater injury to ties and rails at a speed of 30 miles than standing still, at 30 than 20, or at 30 and 16, or 27 and 16. I want you to let me get through with that; I consider that the difference between the injuries at zero speed and at some low speed immediately above is not great. There is wear due to movement, and speed affects the wear; wear of some sort is greater when the speed is greater than when the speed is less. I think that the total wear is greater at high speeds than at low speeds; I think it greater at 40 than at 16 miles per hour. I think, all other things being equal, wear at 27 miles would be somewhat greater than at 16; perhaps 15%.

The passage of a train over a track produces impact, because of the necessary imperfections in the track and in the equipment.

That impact is not measured by the square of the speed multiplied by the weight. A moving train has momentum, and the
1261 extent of that momentum is weight by speed; a moving train imposes impact, and that impact is measured by weight by the square of the speed, but it is not the whole weight of the train which is multiplied by the square of the speed, but the equivalent in weight of the blow caused by the imperfection mentioned. The impact of an engine would not increase as the square of its speed. Its momentum would increase as its speed, directly. If you drove that engine against a bumper at the end of the track and tried to measure the impact, it would increase as the square of the speed; but we were not discussing that impact.

The amount of impact upon the rail depends on many conditions. A train entering a curve will produce an impact upon the side of the rail if the outer rail is not elevated. Assuming a six degree curve and the passage of an engine around that curve at 10 miles an hour with a flat track and rails level, there will be impact; with the rails elevated to the proper degree of elevation for that speed, no impact different from that on straight track. The passage of this locomotive over a straight track would produce impact, and would produce impact on a curve. The impact on the straight track, and also on the curve, would vary—be greater as the speed increased on the straight track.

Square of the speed would be a very small element in the determination of the amount of the impact in both cases, because the impact is caused in the main by certain other causes which have not been mentioned, the speed of whose movements *are* not directly related to the speed of the train. Impact increases with the speed of the blow and where imperfections exist in the track and in the engine with the speed of the passage of the engine over a track whether it is straight or curved. Imperfections always exist
1262 in both to some degree. It is uniformly true that impact results by the passage of the train and increases as it passes either over a straight track or a curved track.

I think that there is necessarily some slippage one way or the other, of one wheel or the other, going around curves. I have observed it to take place, and I have heard it. I may be mistaken in respect of the coning or non-coning of wheels being the practice; in respect of the slippage, I say that it necessarily follows that there must be, through considerable part of the time, a slippage. Coning cannot be made perfect so as to prevent slippage. If there is coning, it would tend to reduce the amount of slippage, of course, and, under conditions that were real, at least, it would prevent it; that would be the purpose of the coning.

The total amount of the accounts which were apportioned between passenger and freight on the basis of wear was $238,904., resulting in attributing to passenger 28.88% or $69,019. If these accounts had been divided on a time instead of a wear basis, it would have increased the charge to intrastate passenger service by $907.84, if the small account of exclusive passenger tracks be neglected. The total of the accounts apportioned by me to passenger and freight

on time was $93,554, the passenger proportion being 29.12 per cent, or $31,183. Had these accounts been divided on the wear basis, the charge to intrastate passenger would have decreased $355.51, the net result of the two being that the cost of intrastate passenger business would have increased $552.33.

The figures just read show the effect of the time basis or wear basis on accounts which were specifically divided on those bases, but not of the amount of superintendence, etc.

1263 I want to say that I have looked further into a subject and discover that I was mislead in accepting a statement of Mr. Russell, to the effect that the wheels were not coned, and that my previous belief in that regard, derived from many sources to the effect that the wheels were coned, was correct. I was right, in the idea that the wheels were coned, up to two or three weeks ago, when I accepted the statement of a man I thought knew what he was speaking of, that they were not, and, in accepting that statement and speaking because thereof, I made a mistake. My work requires me to go over a great many fields; when I get into a subject where I am directly told by a man whom I believe ought to know such and such a thing, which is contrary to my previous belief, if I am greatly pressed for time, as I was on that occasion, I may be mislead then. If the weight were sufficiently greater on the wheel on the inner rail, the slippage would take place on the outer rail; it would slip backwards. The wheels, when new, are coned; they wear, and the cone shape no longer exists, and they become cylindrical. The general effect is that freight car wheels that have been considerably worn have the conical shape largely worn from them.

In the Lackawanna Case I apportioned maintena-ce of way expenses on revenue train mileage. There in Roadway and Track, Balast, Roadway Tools and Supplies, Work Equipment—Repairs, Renewals and Depreciation, and Removal of Snow, Sand and Ice, the common items on the line tracks used by the freight and passenger trains was divided by me on the train mileage basis.

"Signals and Interlocking Plants.—Block and other signals apportioned entirely to Line; assigned to Freight, Line, on basis of

1264 Freight train mileage. * * * Interlockers, terminals, so apportioned, assigned Terminal, Freight, on basis of freight switch engine mileage; interlockers, line, so apportioned, against line, freight on basis of freight train mileage."

"Over and Under-Grade Crossings—Apportioned between Terminal and Line by Bridge Department; Terminal assigned Terminal, Freight, on basis of freight switch engine mileage; Line assigned Line, Freight, on basis of freight train mileage."

"Tunnels.—All Line; assigned Line, freight, on basis of freight train mileage."

"Bridges, Trestles and Culverts.—All Line; assigned Line, Freight, on the basis of freight train mileage."

"Maintaining Joint Tracks, Yards and Terminals—Taken as all Line; assigned Line, Freight, on basis of freight train mileage."

It was my purpose, in preparing Defts.' Ex. 72, Thompson, to adopt the allocations as between states made by Mr. Delf in his work.

I did not adopt the allocation made by him in account 62, "Dispatching Trains."

In the Lackawanna Case, "Dispatching Trains" apportionment between Terminal and Line on the basis of 25% and 75% (estimated 25% of the whole amount being applicable to instructions as to terminal placing of cars, etc., etc.). The amount so apportioned to Terminal assigned to Terminal, Freight, on the basis of Freight switch engine mileage, on the basis of freight train mileage.

Station Employees: In the Lackawanna case, I had an estimate prepared in respect of each station, for a given month, as to the
1265 amount of time relatively attributable against passenger against freight, and applied those results to the year. The apportionment was made by the direct examination of the payroll for each station for a month, and the determination, as to whether each employee exclusively on passenger or on freight business, and if his work was common to both services an estimate was obtained of the relative portion of his time put in on each service. I considered each man's wages separately, and ascertained the amount of time he spent in passenger and the amount he spent in freight, and divided his wages.

I went over this property between St. Ignace and Marquette, and have been over portions of it before. I inspected it with a view to determining whether it was well kept up. In my direct testimony, I expressed an opinion as to the standard of maintenance; in this particular case I was guided by the reports given by my assistants, who inspected all of the line, and I formed an opinion of the condition of that which I went over. That is to say, I rode on the hind end of the passenger trains, watching the track. I should think the train ran from 25 to 35 miles an hour, perhaps 45 some places. I made several trips over this part, I saw it all in daylight.

I said, on direct examination, that the maximum elevation of the outer rail on this line was eight inches. I do not know what degree of curvature you would find eight inches on this road; the point intersecting me at that moment was covering the maximum.

From my own observation, I claim to have enough knowledge to pass upon the standard of maintenance of this road betwen St. Ignace and Marquette. It is a good road, well maintained, up to the standard of single track roads in this part of the country of like
1266 class. So far as I have seen it, its main line is in first-class condition; I think it is suitable for the kind of traffic it has, and good for 40, 50 or 60 miles an hour, so far as track is concerned, and so far as I observed the equipment. I never meant any criticism upon the standard of maintenance of your main line common tracks.

In respect of three miles to one mile, I have assumed that the cost of maintaining side tracks was one-third of the cost of maintaining main tracks. The 13.32% is affected by the 3 to 1 I have spoken of in respect of side tracks.

So far as I have seen the road, I have testified from my own observations and knowledge, beyond that from the reports of my assistants. I testified that, if there were no passenger business at all, this road would have to be maintained to its present high standard. The spur

tracks to mines and son on are sufficiently maintained for the freight traffic. I did not say that on an average the maintenance of the main line costs 3 times as much. That has to do with side tracks.

These traffic spurs were included with the side tracks, and not as main tracks. My memory is incorrect; I had forgotten the fact. I say that I think that heavy traffic spurs to mines should be included as main track, and to that extent then my 13.32% exclusive — freight is an error. Other things remaining unchanged in the application of my method, evidenced by Defts.' Ex. 72, the greater the percentage of freight exclusive in Ratio 2, the less there would — in common, the less in passenger, and in intra passenger. If there be an error as to that, it is aganist you; the amount would be, however, small.

1267 In the Lackawanna case, I divided a portion of the train supplies and expenses between freight and passenger on the basis of train miles.

"Injury to Persons was apportioned between Passenger and Freight on the basis of train mileage; amount apportioned Freight assigned 50 per cent to Terminal, Freight, and 50 per cent to Line, Freight."

'Crossing Flagmen and Gatemen,—Apportioned entirely to Line; assigned Line, Freight, on basis of freight train mileage."

Drawbridge Operations: "All Line; assigned Line, Freight, on the basis of freight train mileage";

Damage to Property, Damage to Stock on Right of Way, Operation of Joint Tracks, Net, in the same manner.

The Master: Do you answer from memory or belief that the brief is right?

A. I am answering from the fact that it appears in this brief in respect of a number of these items that I cannot remember.

General Expenses. "The total of amounts assigned Terminal, Freight, and Line, Freight, in all of the foregoing accounts are respectively divided by the grand total of all items as reported for all such preceding accounts, and the resultant percentages are respectively applied to the total amount of General Expenses and the resultant amounts respectively assigned Terminal, Freight, and Line, Freight."

Fixed Charges. "Total of Fixed Charges in the Nature of Taxes, interest and Rentals. To this total are similarly applied those percentages last above described (and those last above described are under General Expenses) under operating expenses, General Expenses, and the resultant amounts similarly assigned to Terminal, Freight, and Line, Freight."

1268 In that case, the respective train mileage, freight and passenger, became factors, or elements in the factors, which were used to divide, not only general expenses, but also the fixed charges, in the nature of taxes, interest and rentals.

In the division, in this case, of account 2, Ballast, the amount used was the average of five years ending 1912, and being, Michigan $3,989.50. The average for the six years ending June 30th, 1913, would be about $7,500.

Q. It would be quite as reasonable to average for the last six, wouldn't it?

A. Not if you put on $25,000 worth of Ballast in 1913. The inference would be that you were perhaps putting some capital improvements on your road at the cost of maintenance, I should think. Ballast can be made a capital improvement. The addition of a considerable quantity of ballast over and above that which is on the road is, in my opinion, the nature of a capital charge. My understanding is that under some cases the road can treat ballast as a capital charge. I was answering, not upon the strength of what may or may not appear in the Interstate Commerce Commission's classification, but on what I believe the proper practice. I believe the proper practice in addition of new, but not in renewal of, ballast may be to add it to capital.

There is no reason why six years' average instead of five might not be taken here for ballast. I should think that the figure indicated some change of policy on the part of the road.

Q. You think it is too big, so you took the five?

Mr. Wykes: I wish to object to that inference contained in the question, because, when Mr. Thompson's allocations were made, the 1913 figure was not available, and, in the figures that Mr. Parker has put into the record for 1913, six years were used, and the larger figures that you are talking about were used for that year, and the first time they became available.

1269

A. If I had been aware of the amount and had known that it was the mere renewal of ballast, I should have taken six-year items. I don't think any other course would have been allowable.

In the divisions by my gross ton miles, Ratio 1, I have disregarded speed entirely. I believe the speed of the passenger trains in this case causes more mechanical wear than the freight trains, but that the amount is a small percentage, and probably not over 15 per cent due to speed alone, and that that figure is offset by other figures or other inferences upon the other side. Therefore, the additional element of damage due to speed alone would be counteracted and offset. Speed is an element affecting wear. The speed of the passenger trains wears the track, and the things that wear, on the average 15 per cent more than would the same trains if they moved at the freight speed. I fixed it as the opinion of eminent engineers that, the rate of speed becoming very high, the damage to the track becomes less. On the same principle as a man skating over thin ice, the static load is, in effect, decreased. "Static load" means the weight supported by the track when the train is standing still.

I said that the dynamic augment did not pass the limit of the elastic resistance of the track structure until speeds of 30 or 40 miles were reached. "Dynamic augment" is the increase in the weight upon the track due to elements that come into being when the train is moving. They are due in large part primarily to the imperfect counterbalancing of the main and side rods of the engine, rather than to the

movement per se, but they take place when the train is mov-
1270 ing; as compared with static, it means it is moving?

The conception of the elastic limit may be very simply stated, as follows: If a body be stretched or bent or otherwise deformed to an extent that is within its elastic limits, it will spring back to its original form. If, however, the deformation passes the elastic limit, it will not completely return. (Counsel reads previous questions and answers of witness.)

Q. Having called your attention to that testimony, I want to say that it did not give me the impression, and I don't recall any testimony in your direct examination which did give me the impression, that you are of opinion that the average speed of the passenger trains increases the wear of the parts that do wear 15 per cent over and above what such wear would be by such trains if those trains moved only at an average rate of 16 miles an hour, and I understand that as just stated is your opinion?

A. Yes, it is. Static load is the weight of the engine—let us confine ourselves to an engine standing standing on the track, that load is augmented by movement, and increases, other things remaining the same, when the speed increases, but not directly with the speed. Other things being equal, the speed is a very important factor in determining wear. It is so important that, other things being equal, a speed of 27 miles per hour would damage the track 15 per cent more, in my opinion, than a speed of 16 miles an hour. That 15 per cent represents the result of a series of experiments conducted on a railroad by T. M. R. Talcott, an engineer and operating railroad man whose headquarters are at Richmond, Virginia. His experiments were re-
ported in a book written by him on the subject. I don't re-
1271 call the title at the instant. So far as I know, that is the only comparative record on the subject. I thought it bore the indicia of being truthful and correct. I do not now recall of having stated this truth in my direct examination; I only answered the questions that were asked me, and answered them as fully as occurred to my mind at the moment. It was not my intention to give the impression that speed ought not to be taken into account as one of the elements of the whole problem.

I was of the opinion that the amount of power availed of to move the trains would measure, in a reasonable sense, the wear upon the tracks, and I am firmly of opinion that the difference in speed from 16 to 27 miles an hour would increase the injury, taken as a whole, resulting from the use and passage of the train, at least 15 per cent.

Well, I have to say that there apparently do not exist a great number of experimental determinations of this sort, and I availed of those which I could, together with such experience as I have, and my reasoning power to such extent as I have that. I should expect that the relation would be greater in case the speeds were increased to 20 and 40, and that the damage at the 40 would be somewhat more than 15 per cent in excess of that at 20. I am not able to say, offhand, how much greater. I think that the injury at 50 would be markedly greater than at 20; it would be more than the 15 per cent.

I divided ties all on the weight basis, because a majority of the

dollars were expended because of wear, and not decay. If the proportion due to wear and that due to decay could be ascertained, it would be more exact and scientific to divide each proportion by its appropriate factor.

The cost of repairing damage that is caused by any particular traffic should be charged against that traffic, and those costs not
1272 caused by any particular traffic, but which run with the lapse of time, should, in my opinion, be charged against the several traffics ratably with the proportions of time through which they use the property. I do not think there is any other basis at all, except the time basis, appropriate for dividing the weather stress items.

Repairing a washout is weather stress, and ought to be divided on a time basis. Washouts occur at unknown and variable intervals through a series of years; the cost of repairing them has to be borne by the property as a whole, and I think it should be charged against the several classes of traffic in the porportion in which they avail of the property. If the fence is out of repair, and a bull gets through the fence and derails a train and breaks down a bridge, I think the bridge ought to be restored on the basis of time, because, to carry your suggestion to its logical absurdity, in the course of so many years so many bulls would break through so many fences.

I don't think the speed of trains has anything to do with it. I have in my answers endeavored to point out that whereas you use the speed of trains in connection with my time ratio, I refer solely to the elapsed time during which the trains avail of the facilities. The speed of the passenger is 27 miles, and freight 16; that makes 43, added together; 43 into 16 will give about 36%. I should think that the excess of about 7 per cent is due to the additional time that the freight train is at the station over the time the passenger is at the station.

I recognize, of course, the distortion of my views into your hypothetical case; I recognize also what you say logically follows, but I don't think that destroys the value of the views.

1273 Q. Now, I am trying to ask you what relation to that subject the excessive time of the freight train at the stations between terminii has to it?

A. You carry in your question a very nice little inference, which is that the freight trains are standing in front of these stations, whereas, in considerable part, they are switching on the main track, the sidetrack, etc., and are availing of properties in respect of bridges, probably the fact is that there isn't very much switching done over bridges; to that extent your argument is reasonable.

Q. It appears from one of the Delf exhibits that 32.2% of the time of the freight trains with certain exceptions, is spent at stations, and that much of that time so spent at stations is spent on tracks that have been assigned by the defense here, and by you, to exclusive freight uses; now I want to ask you what relation has the time spent on sidetracks assigned to freight, by freight trains, to the problem of dividing the cost of renewing a bridge, or the ballast between stations, or the fences between stations?

A. It has none, whatsoever.

Q. Or maintaining ditches, or embankments, or slopes?

A. It has none, and were the figures capable of sufficient refinement to extract these elements of error, I should say that they should be so extracted.

I stated that the average speed of the passenger trains while moving was 27 miles per hour and freight trains 16 miles per hour while moving. What I did was: I made examination of the dispatcher's reports for March 30, April 15 and 30, May 15 and 30, and
1274 June 15 and 30, 1912; the examination covered 42.5 miles out of 198 on the Mackinaw Division, between Marquette and Wetmore, 45.9 miles out of 94 on the Houghton Division, between Marquette and Nestoria, and 35 miles out of 99.6 on the Western Division, between Covington and Bruce's Crossing. It is possible that, if a complete examination was made, those figures might be varied one way or the other, but I don't think the variation would amount to much.

I think the damage to track caused by a train running 60 miles an hour is considerobly more than that caused by a train running at 10 miles an hour. I cannot attempt to state how much more, offhand; an opinion of that sort, given offhand, would be of no value. "Critical speed" is a term used by engineers. The use of the term "critical" by engineers is that which indicates the change from one set of results to another set, occurring distinctly at a given point as in the matter of speed, a given rate of speed or a given degree of temperature in some other problem; 27 miles an hour might be a critical rate of speed on some structures. I think that would depend entirely upon the nature of the structure. The critical speed varies with conditions.

Railroad managers recognize that speed is an important factor as to strain on bridges and the requirements of strength and the like, by limiting speed on bridges that are weak. I think it clear that the movement of a train at as low a rate of speed as 27 miles an hour, or even 10 miles an hour, over a bridge imposes more stress upon the bridge than with the same load standing still. I think that the difference of 10 miles an hour is very slightly perceptible, and 20 miles is considerably perceptible. It goes up pretty fast when you get 20 miles an hour, and along 30, 35 and 40 it goes up fast. I don't think it is true that freight trains never reach 35 or 40 miles on this road. I think they frequently run as
1275 fast as the passenger trains. I think they frequently run 40 or 50 miles. I think you would need just as good bridges and structures for the freight trains at their speeds as for the passengers at their speeds.

The size or weight of the train did not make any difference in the time element, except if the trains were of great length it would probably increase the time required to get over the road. Within the limits of 30 cars compared to an engine and a caboose, it wouldn't make any difference.

Q. The Geological Survey department of the Government of the United States is accustomed to use the railroads of the country, with their consent, to get over, and to use these little velocipedes, sometimes called "speeders"; They don't go very fast at times. Under this time theory, assuming the Government was to pay its share of the weather stress items, there would be chargeable to this speeder,

going over the road at 4 miles an hour, as much as there would be to ten passenger trains at 40 miles an hour, on the average?

A. Yes, I recognize the conclusion that follows from your assumption, but I think as a matter of fact the speeder would have to get off of the track and out of the way.

Q. Assuming there was no train coming, as is the case nine tenths of the time on all parts of the South Shore road, the track is idle, and a speeder goes by on an average of four miles an hour, for a hundred miles, under your theory it would be justly chargeable with as great a proportion of the weather stress items as ten passenger trains over the same hundred miles at 40 miles an hour, would it not?

A. I see that that apparently follows from your assumptions.

1276 Whether or not a careful examination into the components of the hypothesis would make me say yes after I had so examined, I don't know; it is one of those things that appear to be perfectly simple on the surface but may not be when analyzed.

Q. You think, do you, that, as far as the weather stress items of maintenance of a toll bridge is concerned, the child trundling across it with her doll at two miles an hour should be charged ten times as much as the automobile spinning across it at 20 miles an hour?

A. If the cost is made the basis of the charge for the service and the child and the automobile respectively had exclusive use of the bridge, I think that that conclusion follows.

Q. And that would be true even though there was nobody to use the bridge for that week or month except the child and the automobile, because the idle time for the rest of the month should be charged ratably to the time occupied by the child wheeling her doll across the bridge and the time occupied by the automobile spinning across at 20 miles an hour, each being a use exclusive of the other?

A. I think that follows. We are of course endeavoring now to find costs that have taken place in the past. It is not a new plan; it is very old; the application of it to railroad practice is the only thing new about it.

The Master: With regard to apportionment of waste time you were speaking of the other day, what is the connection between time wasted and time used that makes it proper to apportion time wasted on the basis of time used?

A. It has this connection; if statistics are being compiled for the

1277 purpose of ascertaining how cheaply the service can be performed, with the intent to get enough business to keep the facilities full all the time, then your statistics should be cast up without regard to idle time, because the idle time can be availed of, in the event you can sell your goods so cheaply that you can get enough business to completely avail of your facilities, but if, on the other hand, you are trying to find out what it did cost you in the past to make two different things, it is good practice and customary and standard cost accounting practice to charge to the two things the idle time on the same relative proportions as the availed of time.

The Master: The road is holding itself in readiness for the freight traffic and passenger traffic, one as much as the other, when it is not being used, isn't it?

A. Yes.

The Master: Why shouldn't it then be apportioned equally, if at the time it is idle it holds itself in readiness for either branch of the traffic?

A. We are trying to determine what happened to it in the past. Now, if, as a matter of fact, in the past, let us say 90 per cent of the time used was in freight business and 10 per cent was in passenger business, but the sum total of these was only 50 per cent of the whole available time of the road, then it would be quite clear, I think, that the expectation of the road, looking toward filling up the other 50 per cent, would be to get 90 per cent freight business and 10 per cent passenger business; not that half of the other 50 would come from freight and half from passenger when 90 per cent of that which had been used was used for freight and only 10 per cent for passenger; I think it would be an unreasonable expectation.

The Master: I am unable to see why, in regard to the past,
1278 the unused time should be apportioned on the basis of used time. It would seem to me, if it is apportioned unequally, that it should be in the inverse ratio rather than the direct ratio.

A. No sir, I don't think that would be reasonable. What happened; what were the conditions existing in the territory? It would be perfectly good accounting to say that the wasted time should be charged neither against the passenger nor against the freight. You can say it should be charged against neither, and should form the subject of a fiscal charge, or general loss, against the capital of the company, but it wouldn't be good accounting to charge it equally.

If the company has gone into a business in which it has established a plant vastly greater than can be availed of by the goods it can sell, then the cost of maintaining that plant or the excess part of the plant may be in the nature of a charge against the fathers, if you please, of those who built up such a big plant. That is the only place it could be charged, unless it is distributed ratably between the services on the basis of the actual availment by each, and that principle is universally recognized in cost accounting, and can be found stated in many books written by authors of standing. This time element is used as a factor to divide weather stress expenses related to the main line, merely because that is the common portion that is to be divided—the main line and passing tracks ancillary to it. The principal part of the amount that I have distributed on the weather basis is the maintenance of the main line and operation of it.

I don't intend to criticize anyone at all, but it may be you over-built if you built any railroad at all. I certainly meant no reflection upon the policy of your company, but it might be that you had a railroad where there was no business for a railroad
1279 whatsoever. I do not intend to imply any criticism as to the location of this road, or claim that it is over-built; I am merely connecting up your question with my remarks to the Master. It might be that you people may have built a railroad where there was no business for a railroad, but that is not within my province.

Q. I would like to have you give attention to the question closely, because I have written it out almost entirely. It appears that the

density of train movement is very light on this road, and that many more trains could be run. Now, assume that a freight train moves 6 miles between passing tracks in 30 minutes, but does not interfere with or delay any other train, why should it be charged more on account of the weather stress items, like fences, bridges, etc., than if it made that six mile run in six minutes? I would like to have all of your reasons for that?

A. My view on that is this: The items of expense which run with time and have no relation to mechanical wear caused by any particular service, should be charged against the services in relation to the time through which the traffics availed of the facilities. Thus, the freight traffic, were it carried in common equipment, would be chargeable with the expense of such equipment during the time that the freight was loaded in it, and likewise in respect of the time that the freight trains are availing of the tracks. That seems to me to answer your question, but, if it is not in sufficient detail, I should be glad to go further.

Q. I am satisfied with it, if you are.

A. Well, you have the advantage of me, of having seen your question written out; I have not. If, after I see this in writing, I want to expand it, I should be glad to avail of the opportunity. I think of nothing further at the moment.

1280 Mr. Butler: I would like the record to show that you have had full opportunity to give all of the reasons that occurred to you at this time, and also that you be insured opportunity to expand your reasons if after reading your answer you would like to do so.

I did not ascertain what the operating percentage on the total passenger business in Michigan would be on the basis of my determination of its cost after eliminating the amount that I assigned as the cost of the sleeping and dining cars. I made no attempt to get any figures in respect of revenue. My own view is that the operating ratio is a comparative figure only. That is to say, its principal use is in comparing one year with another on the same road.

The Interstate Commerce Commission statistics show it, and they make the comparison one road with another, possibly, but, whereas that comparison is very frequently taken by people to indicate the degree of expensiveness of operating, as a matter of fact, it does not necessarily show that, because one of the elements is the amount of money received, which would be affected by the rates, regardless of the cost of operating.

Q. By taking from Complt.'s Ex. 48, Delf, sheet 3, the revenue of $805,532 for the passenger, and $9,634 for baggage, giving a total of $815,166, and dividing it into your operating expense after eliminating the $112,000 which you assign to the dining and sleeping car, there is left $364,809. Also, eliminating the $57,000 odd which you assigned to mail and express, it is disclosed that the operating percentage for the total passenger business in Michigan on the

basis of your calculation is 44.7%. Is that a high or a low percentage when compared with other roads generally?

1281 A. It is a very low percentage when compared with other railroads generally. But, in making this comparison, it is necessarily made with figures which are not comparative; i. e., in the expenses of roads generally, the cost of hauling sleepers and diners and mail and express is included. Including that, and making calculation on the same basis, the operating percentage is 57.7. It is a low operating percentage. The conditions on the South Shore, especially the sparsity of traffic, the few persons per car and per train, and all that, make for high cost to earn a dollar.

I would expect a much higher cost on the South Shore than I would on the New Haven, the Pennsylvania, the Baltimore & Ohio, or the Norfolk & Western, which is perhaps the best Southern freight road. I do not know whether the South Shore would be able to earn a passenger dollar any cheaper than the Norfolk & Western. I know there has been an application for increase of rates in the east. I have followed the application for an increase of rates by eastern railroads, and know of the Government's employing Louis D. Brandeis, a very eminent lawyer of New England, to represent it in those matters. I remember newspaper comments on his argument on April 30 and May 1st, before the I. C. C. I read the article in a daily paper.

Q. That argument is abstracted in the Railroad Gazette of May 22, 1914, page 1133. It is there indicated that the roads have been unable to introduce in the passenger department economies that have been introduced in the freight department, and that in consequence the expense incurred in the passenger service has increased much more in proportion than the earnings from passengers, mail, and other passenger train business, that on all roads in the eastern territory which try to allocate their freight and passenger

1282 expense, the passenger business is being handled at a loss. I want you to assume for the purpose of your answer that the statement I have made, as taken from Mr. Brandeis' argument, is true in point of fact, and then ask you whether or not on that assumption you do not readily reach the conclusion that your determination, that it costs only 44.7 cents in Michigan for the South Shore road to earn a dollar in the transportation of passengers is wrong?

A. No, I do not reach that conclusion, and there are reasons for that, one of which I would like to state.

Q. It is also stated in Mr. Brandeis' argument that Harold Elliott, of the New Haven road, reported to the stockholders, according to Mr. Brandeis, and "He said more than 50 per cent of the revenues comes from passenger trains and for passenger trains the cost of operation is so great as to leave nothing whatever for taxes or investment." Now, I want you to assume that that statement concerning the New Haven road is true, in fact, and ask you whether or not that would in your mind tend to shade any doubt whatever upon the correctness of your determination, that the South Shore road, in Michigan, can earn a passenger dollar on the one basis you have used for 44.7 cents and on the other basis for 57.7 cents.

A. No, it would not.

Q. It is also stated in this abstract of Mr. Brandeis' argument, that: "The science of railroad cost accounting is almost in a rudimentary state, but Mr. Willard"—meaning Daniel Willard, president of the Baltimore & Ohio, "an experienced and efficient railroad manager, when he came upon the Baltimore & Ohio Railroad in 1910 recognized that an attempt must be made at once to separate passenger service from freight service so far as cost accounting was concerned, and we have, beginning with 1910, an attempt to allocate expense between passenger and freight. A considerable success has been attained, in allocation specifically of 70% of the total, leaving only 30% to be apportioned. Taking these figures subject to all of the criticisms which we know they must be subject to owing to the limited perfection in the comprehension of railroad science, and what do we find. We find taking the figures for the first full fiscal year which we have, the year ending June 30, 1911, and comparing them with the figure for June 30, 1912, exactly what we would have expected in respect to traffic under Mr. Willard's efficient administration because the broad ratio of operating expense has been reduced in that two year period from 68.16 per cent to 66.44 per cent or nearly two points. At the same time what do we find in regard to the passenger traffic? We find that the passenger cost in those two years, according to these figures, has increased from 82.39% to 106.23%, showing according to those accounts that the passenger traffic in the year ending June 30, 1913, absolutely cost the Baltimore & Ohio Railroad six points above, that is 6%, without taking into account capital charges. Applying that upon the total passenger revenue we make the increased operating expenses for the passenger train service of over four million dollars more, as a matter of fact, than the total amount that the 5% advance upon all the freight rates would amount to taking the year 1913 as your basis."

1283

Now, I ask you to assume that the statements which I have just read are true, in point of fact, and then ask you your opinion whether or not they shed any doubts or questions upon the correctness of your determinations, first, that on one basis the South Shore road in Northern Peninsula of Michigan can earn a passenger dollar for 44.7 cents and on the other basis for 57.7 cents.

A. No, they do not, to my mind. I did not consider them comparative.

Q. Mr. Brandeis also is here reported as making this statement concerning the Pennsylvania:

"On the Pennsylvania system it is not a new thing to separate the accounts. They have been doing it for just half a century. Every year the Pennsylvania road has given to its stockholders a statement showing the separation of freight and passenger earnings and expenses. It shows exactly the same trend which he found on the Baltimore & Ohio. The figures are somewhat different the spread is somewhat different. And it may be because of difference in the efficiency of management. But what do we find? We find that in 1907 the operating ratio of the Pennsylvania for freight was 71.6 per cent. In 1913 its operating ratio was 73.4 per cent. There is a

difference of 2.2 per cent. In these six years you have had no doubt ten or more per cent increase in wages; you have had an in-
1284 crease in taxes and you have had those increases in legislative burdens; but the efficiency of the Pennsylvania management dealing with its freight has enabled it to keep down these operating expenses to 2.2 per cent and keep them down there in spite of that liberal charge of maintenance and equipment and maintenance of way on which Mr. Lyon and Mr. Thorn have spoken. In 1907 the passenger ratio was 74.4 per cent. It differed there very little from the freight, which was then 71.6 per cent, an increase in these six years of 18.2 per cent whereas the freight ratio had risen 2.2 per cent."

Assuming that the statements that I have just read to you concerning the Pennsylvania are all true in point of fact, are you still of opinion that the South Shore road in Michigan can earn a passenger dollar for 44.7 cents? I want you to assume that your figures when divided by the proper amount of revenue, disclose that fact, to-wit, that, on the basis that you have used, a passenger dollar can be earned by the South Shore road in Michigan for 44.7 cents, and then ask you, assuming the statement concerning the Pennsylvania to be true, whether you are of the opinion that the South Shore can earn a passenger dollar in Michigan for 44.7 cents; that is the opinion I want.

A. My opinion in this case is the same as that stated by me.

Q. Are you of opinion that the South Shore road, in Michigan, in 1912, did, in point of fact, earn a dollar in the passenger business, on the basis you employ, for 44.7 cents.

A. I have no opinion about that, because I do not know what they earned. Assuming that your statement of the earnings are true, I think they did, and feel pretty certain about that.

Q. Concerning the Norfolk & Western, it was said by Mr. Brandeis, as reported in the Railway Age-Gazette, as follows:

"To the south of the Baltimore & Ohio was another railroad which everybody recognizes is peculiarly well managed; allied with
1285 the Pennsylvania and having in Mr. Johnson an extremely competent president, the Norfolk & Western. Its conditions are different. They too have undertaken to separate the passenger and freight service. They have done it since 1907. Apparently when they started they took as their basis the same operating ratio for the two, which was 64.8 or 64.7, the operating ratio of both freight and passenger. What has the movement been? In freight but slight increase. It increased from 64 to 65, an increase of a little over one point, but in the passenger service the increase has been 64 to 72."

Now, I ask you, assuming that the same method for the determination of the operating ratios, freight and passenger respectively, was on that road followed from 1907 down to and including 1913 and applied to the results of each year, whether or not in your opinion the cost of doing the passenger business has been advancing in the last 6 years?

A. I think that that would indicate that the cost has been so advancing.

Q. Now, I want to ask you whether or not in your opinion, assuming the statement concerning the Norfolk & Western, the Pennsylvania, the New Haven and Baltimore & Ohio, which I have read to you in this morning's examination, to be true, and assuming further, that the methods for the ascertainment of the operating ratios, freight and passenger respectively, were well adapted to disclose the actual truth, and the best that could be devised by skilled accountants familiar with the property concerning which they keep the accounts, the South Shore road had an operating ratio in its passenger business in Michigan in 1912 of 44.7 per cent, on one basis you have stated, and 57.7 per cent on the other? Assume that derived by dividing your operating expenses by the proper amount of revenue? I would like to have you answer it, in the interest of saving time, affirmatively or negatively, and then explain
1286 your answer, and not only that answer, but give the reasons which you asked permission to give sometime ago and which I asked you to defer until I had concluded on these matters?

A. Yes. In response to that portion of your question which directed me to go back and state some reasons that I was about to give in explanation of one of my earlier answers, I will now say that I consider that the conditions of operation of the roads that you have mentioned, and the expense items that came into their accounts, are wider than from those which appertain to the South Shore road, and among these are the facts that a number of these eastern roads have very expensive passenger terminals, the cost of whose upkeep is admittedly an expense which is out of proportion to any additional revenue that might be derived because of the expense of such terminals; that of the Pennsylvania, in New York, I am informed cost so much money that the charges for depreciation and interest on it amount to about $1,000 a year per mile over the whole system. The cost of upkeep would include depreciation and operating expenses attendant on maintenance of the buildings, and I have not now before me any figures which separate these from the interest charges. I was also intending to refer to the expenses of terminals jointly used by the B. & O., Pennsylvania and the Norfolk & Western, in Washington, and the expensive terminal of the B. & O. at Baltimore, and others. Further, these railroads run large numbers of heavy, high speed trains which are made up largely, and frequently entirely, of sleeping and parlor cars, and the earnings in these trains, which frequently carry but a small number of passengers proportionately, are low relatively to the large train expense; and the expenses that these roads charge against the cost of passenger service include all expenses of hauling such cars.

The New Haven is not comparable with the South Shore, for several reasons. One is, the New Haven does a large com-
1287 muter business, with low rates, running about 6 miles. They haul more people in a car than the South Shore.

One of your questions assumed the same methods of accounting had been in vogue during all the period mentioned, and others did not make that assumption, and if as a fact changes in methods

of accounting took place during the period, they might materially affect the results shown, and further one of your questions assumed that the method of cost accounting was the best that could be devised, but other questions did not make a like assumption.

Q. I want you to answer on the assumption that the accounts were well kept and the best that could be devised to show the truth?

A. And I will continue to answer as before I was interrupted. That is, as a matter of fact, these systems of accounting were not so devised as to show the truth; the error well might become cumulative through a series of years.

Q. My question requires that you assume that they are the best that could be devised to show the truth?

A. On that assumption, I gave full and complete answer as I was requested to, "Yes," and then I paused to indicate I had completed my answer and I made no attempt to qualify or modify my answer, and then I stated, I think very clearly, that I would continue, as I had been directed to do, to give an explanation of the reasons why I was going to modify an earlier answer, and those reasons I was giving when I was interrupted.

I am advised by counsel that, where I have begun to answer a question which was made to me upon the record and have answered a part of it and opposing counsel instructs me to modify his original question, I should proceed to answer the original question
1288 as I was answering, unless the entire record be stricken from the stenographer's notes, and in view of that instruction from counsel I will now continue to answer the earlier question as it was originally put, as I understood it, just what I was doing when I was interrupted, and I will go on to say: That this is also involved in the figures introduced in the Eastern Rate cases, namely, the possibility that if the rates of passenger fares had been reduced the passenger earnings as a whole would have increased and the profitableness of carrying passengers might have increased. That completes my answer that I was endeavoring to give to the question at the time I was interruped. A number of these eastern lines, some of them especially, are exposed to active competition in the passenger business from interurban electric railways.

Q. On page 19 of Defts.' Ex. 72, Thompson, there is a ratio called Ratio 2, and part of that is freight exclusive 13.32. Is that 13.32 correct, and if it be not correct, give us the correct figure, if you are ready, and if you are not ready, say so?

A. It is correct, as I intended to make when I made the exhibit, because at that time I did not have the information that some sidings were maintained by the individuals. I am prepared to furnish the figure which will express the subtraction from sidetracks and the like and those which are maintained by the individuals, and the result is to decrease the figure of 13.32% by 62/100ths of one per cent, leaving the figure 12.70%, with a like increase, of the figure 86.59%, by 62, to 87.21%.

I stated yesterday that if it were the fact that mining spurs which I included as sidetracks were heavy traffic spurs requiring

1289 large expenditures for maintenance, in such case I thought it would be requisite for me to transfer those spurs from sidetracks, where I had grouped them, to main tracks. Since the session of yesterday, I have looked into the subject and have discussed it with Mr. Hone, my engineer, who was more familiar with it than myself, and I have also read certain portions of the record in this case in which plaintiff's witnesses testified that the cost of maintaining these ore traffic spurs is about 25 per cent more than the cost of maintaining the sidetracks, and also the testimony of plaintiff's witness, Delf, to the effect that the cost of maintaining sidetracks as a whole is about a third of the cost of maintaining main tracks, and in view of these things I think I do not care to adjust my percentages further by carrying the mine spurs from side to main tracks.

In respect to account 63, "Station Employes", I adopted Mr. Delf's figures so far as he had allocated them, and then I divided the common on the allocation.

I agree that if, at the Soo, St. Ignace, Houghton, Ishpeming, Negaunee or Marquette, there were no exclusive passenger employes and only one or two on the line, it wouldn't get right results to make the division by the allocations, because it would take all the common into freight, practically.

Of the sum total allocated by Delf to passenger and freight, passenger exclusive amounting to about 15 per cent and to about 85 per cent of the total, assuming that Negaunee and Ishpeming would be fairly representative, then it would charge too little against passenger. The Soo is a very important station, and the fact that it has no exclusive passenger up there, because of the Union depot arrangement, would have some bearing upon the cor-

1290 rectness of dividing the common on the basis of the allocations. If it be a fact, for example, at Houghton, that the exclusive freight employes are engaged in handling freight, that doesn't affect the work at the intermediate stations on the line. That would also tend to impair the correctness or veracity of the division on my basis of dividing the common by the allocation percentages.

The correctness or incorrectness of my basis of dividing the common portion of this item depends upon a study of the situation and an analysis of the work done by the exclusive freight and passenger men, and all of the facts bearing upon the question. I did not verify these figures or analyze the work of thee men, as in the Lackawanna case, to find closely what each man was doing. I kept very close track of what my men were doing, but I did not attempt to check their figures back to the records or find out what your station men were doing, except as disclosed by the figures in the payrolls or accounts.

In connection with what you have just said about my personal familiarity with these things, I would like, if I may, to be permitted to state to the Master and because it has been stated on the record very strongly by counsel for the plaintiff that "this witness appears to be unfamiliar with the details," that at the time this work was

under process, and it was completed early last summer, I was very familiar with all that had been done and could readily have discussed any of the detailed subjects, although, of course, I couldn't have gone into the question as to whether transcripts were correctly made from plaintiff's record, and that since then, about the middle of October, I was very seriously injured; my spleen was ruptured by a collision between an electric baggage truck and
1291 myself, and I was in the hospital for some months after it; verw narrowly escaped; and one of the effects of this injury, and the surgical operation which followed, was to markedly impair my memory for details, the things that were in my mind before; but since then I have endeavored to get back into my mind the details in this case, but I was instructed by counsel that it would be unnecessary for me to spend a great deal of time and study endeavoring so to do, as the matters of detail could be proved readily by my assistants, and it would be sufficient if I was familiar with the principles involved.

I adopted Mr. Delf's division of the station employees in this case as follows: He allocated the Michigan total to passenger, freight and common. I divided the common on the basis of the allocations made by Mr. Delf to passenger exclusive and freight exclusive in Michigan. I subsequently reduced the charge to passenger by 10 per cent assigned to mail.

I found that 2.75 per cent of the total freight time in this time calculation on which Ratio 4 is based was due to the delay of freight trains on account of the passenger business. That 2.75% was subtracted from the freight time. It was not added to the passenger. Assuming it right to add it to the passenger, the time and not the per cent should be added; that time would be more than 2.75% of the passenger time, or over 7%, as the passenger time is less than the freight.

The truth of the results produced by the train mileage basis, or the degree with which the results of that basis would approximate the truth, would vary with the speed as well as with train loads, and with train constituents and with weights and number of wheels and wheel impacts, and all of these various items.

1292 I wouldn't say it was my opinion that there are no refinements on plaintiff's track that are not made on account of the passenger business. I am not familiar with the manner in which this company does in fact remove snow and ice in case of storms, and did not intend by anything I have said, in direct or cross, to indicate what the fact is in that regard. I thought the fact was immaterial. I have no doubt that they hold the freight trains until the storm subsides, but I don't think the fact is that they plow it for the benefit of the passenger trains; I consider that notion absurd, and I would consider that absurd if I had never been on the Northern Peninsula and had never seen the road.

Q. And you would set up your opinion against Mr. Lytle, who has spent his lifetime operating that road, wouldn't you?

A. In that respect, I think Mr. Lytle had not analyzed into what

he was saying. I think, in general, passenger trains ought to be preferred over, and have the right of way against freight trains.

Q. In the opinion of the Buell case (1 Wis. R. C. 427), to which you referred in your direct examination, I find this statement: "Thomas F. Woodlock and others hold that that part of the cost of maintenance which depends upon traffic should be apportioned between the different departments of the service on the basis of the locomotive mileage, switching included. This position may be well taken for many authorities hold that the locomotive mileage alone is responsible for at least one half of the wear and tear of the track." Do you agree with the statement that the locomotive mileage alone is responsible for one half of the wear and tear of the track?

A. No. I disagree with that.

Q. Do you agree with the statement that the engine mileage, plus freight and passenger switch engine mileage respectively, when
1293 there is no separation between terminals and line, is a proper basis for the apportionment of the common expenses due to wear?

A. In respect to that, I think if the switch engine mileage is added the result comes nearer the truth, but I don't agree with the method. I think it is wrong. A locomotive on a passenger train is, as a rule, a much greater percentage of the total weight of the train than is the locomotive on the freight train. The locomotive weight does more damage to the track in respect of impact injuries than an equal weight of empty cars, though in respect of static load it is less so. As to loaded freight cars, I think that, in the case of some of the modern freight cars with very heavy axle loads, the difference is not so great. There is a static load when the train is moving. The static load is a load when the train is at rest; that load continues when the train is in motion and is increased by what engineers call the dynamic augment.

Q. A moving load is dynamic augment into static load, and you have only static load alone when the thing is standing still.

A. You have static load when it is standing still, but it is not "into," as you stated, it is "on to." I have a general recollection of the Buell case, but I don't remember its details.

Mr. Butler: It is just preceding page 425, the discussion of several pages there; that is what I draw from it, that the railroad companies claim that the train mileage did not assign to the passenger enough of wear items. Then I find, on page 425, this statement: "If this conclusion is sound it must inevitably follow that that part of the expenses under maintenance of way which depends upon or is caused by train mileage, may be fairly apportioned between passenger and freight traffic on the basis of the train mileage."

A. Well, I will have to answer that in two sections: I will
1294 say that, as a hypothetical answer on the assumed state of facts, I would be forced to agree, but, as a matter of fact, my opinion is that the notion among railroad people, that a passenger train mile is equivalent to a freight train mile, is a mere inheritance from early days when freight trains were light, and that the increase in the

weight and length of freight trains has entirely changed the circumstances.

Q. Was that the old rule?

A. It was the old, early rule, yes.

Q. And even as late as a few years ago it was universally used to divide the common expenses, wasn't it?

A. I don't think it was generally used at all, but it was included in reports of some companies down to about 1893, as I recollect. The train mileage as the basis for the division of the common expenses was used in some of the following cases: The Minnesota cases, the Missouri cases, the Arkansas cases, the North and South Dakota cases, and the Lackawanna case. I have a list which is set forth in a publication of Mr. Muller's that shows comparatively all the various bases that have been used (Defts.' Ex. 80).

Assuming a straight track, a steep grade and a train going up it, grade is not an element of impact. I would not say that, if you were running a train 60 miles an hour up a five per cent grade, there would be no impact on the grade. There would be. The speed which is to be squared is the speed of impact of the weight upon the track, not the speed of the train. In the case of a locomotive, the chief causes of impact that vary with the speed are the imperfect counterbalancing of the side rods, the angularity of the main rod, the rocking of the engine upon its springs, the effect of the reciprocating motion being applied first at one side and then at the other, in respect of sideway stresses, and the imperfections in the track, as at low joints. Track that is subject to carrying heavy traffic becomes depressed, particularly at the rail joints, and at these points of depression the blow of the engine is increased; furthermore, when there is no depression, there is impact as the wheels jump over the slight open space between the rails.

1295

Going to the cars behind the engine, the principal cause of augmented impact is to be found in the difference between the type of springs under the different cars. The term "critical," properly used, means the point at which the injury due to speed begins to decrease, and thus, in the case of very high-speed trains, the injury to the rail joint is less than in the case of lower-speed trains, but this same term "critical" is frequently used, in a somewhat improper sense, to mean the point at which the injury increases. The true meaning of the term "critical," in respect to a change in effect, is a point at which the acceleration of change becomes retarded and the contrary effect from that which perhaps might have been expected occurs.

It has been determined by experiment that trains running at very high rates of speed fatigue the rail joints less than trains running slower. The difference in the effect of speed on a long and short span bridge is, as I understand it, that on the longer span bridge the elasticity of the steel absorbs the shock. I am not aware that there have been any experiments to determine that thing on a wooden bridge. These conclusions have been a matter of research by me. I consulted a number of books in respect to this particular thing.

Mr. Sellew's book, so far as I recollect it, doesn't refer to critical

1296 speed in respect to spans on bridges, although it does refer to the German experiments that determine that high speed trains injure the track less than the low speeds; I mean the very high speed trains. Some of the other books that I have read in the matter are Tratman on Railway and Track Work and Byers on Railroad Operation. I think that their discussions in respect to the effect of speed have to do with the effect upon the tracks.

In respect to the bridges experiments, the matter was excerpted and brought to me by my former chief engineer, Mr. John S. Worley, now a member of the Federal Valuation Board of the United States Government. My recollection is that it was in the form of about a page of typewriting. I don't remember any other paper, writing or document, and my recollection is that Mr. Worley told me he couldn't find any other. Mr. Worley is a very talented civil engineer, is experienced in matters of bridges, though he is not by profession a specialist in bridge engineering. I recollect, however, that his opinion was confirmed to me by Mr. Franklin M. Hill, a specialist in bridge engineering.

I should expect the critical speed would have the greater effect on the stringers and girders than upon the floor beams; while I cannot tell you definitely why I think so, that would be my opinion. Impact is greater when simple locomotives are used than when compound locomotives are used, because of the better balancing of the compound locomotives. Vibrations are cumulative in both, but the cumulation would be greater in the simple engine because of the greater variation in comparative thrust communication to the parts of the locomotive at separate points of time. By thrust, I mean the power applied to the piston and communicated from the piston rod, or communicated by the piston rod, to the connecting rod, or communicated by the connecting rod—here I mean the main
1297 rod—to the wheels and the side rod. I think rough and flat wheels are noticeable on floor beams and truss members, and that the effect would be greater upon the floor beams. Floor beams are more closely related to the point of impact on the rail than on the trusses, and the effect would be considerably absorbed before it reached the trusses.

It is generally considered by engineers that excessive elevation on curves increases resistance and makes the load harder to pull. The coning of the wheels that I spoke of, or that you spoke of, whichever it was, in respect of the travel of the wheels around the curves, wouldn't have the effect that you apparently said it would have, i. e. of equalizing the distance of travel of the wheels around the curve, because, if the outer rail is properly elevated upon the curve, the effect would be to reduce the curve to the conditions of a straight track and the wheels would run centralized between the rails, just as they did on a straight track. Now, then, as I understand it, the purpose of the coning of the wheels is not to equalize the distance of travel around the curve, but to cause the wheels to ride in such a manner that the flanges will remain at a little distance from the rails and not cut the rails heads, and if, as a matter of fact, the passage of a freight train around a curve was at a slower speed than the passage

of a passenger train around that curve, the effect of coning would be to produce exactly the contrary effect from that which would seem to be intended, if they were intended to equalize the distance of travel around a curve.

Furthermore, I have produced and examined a copy of the Master Car Builders' rules since adjournment yesterday, for the purpose of ascertaining the limits of wear under which the Master Car Builders' require the wheels to be changed, and I find that the limits of
1298 wear do not take place when the coning is ground off and the wheel becomes cylindrical, but considerably later, i. e., when th cone has become reversed. I am still of the opinion that the wheels have to slip around every curve, one or the other, or both of them, in one or the other or both directions.

Q. Do not slow, heavy trains around curves, where the outer rail is elevated, tend to increase the elevation of the track because of the lightening of the pressure on the outer rail?

A. The tendency from the cause which you have mentioned alone would be that which you have said, but there is another tendency, namely, the tendency of the wheel to continue upon the tangent, which tends to cause the wheels to climb up to the outer rail. That varies with the speed, but more with the character of the equipment—the readiness with which the trucks swing upon their king pins. Thus, in freight equipment, where the wheels do not turn as readily as on passenger equipment, there is a greater tendency for the trucks to ride upon the outer rail, and the wear, as a matter of fact, is found to be much greater on the outer than upon the inner rail. Therefore, it would be my judgment that the tendency of the heavy train to depress the inner rail would be counteracted by the causes just mentioned.

Q. The Committee of Economics of Railway Location of the American Railway Engineering Association reported, among other things, in 1913, to the Association as follows:

"In studying average maintenance expenses by divisions for a period of years on the large system previously mentioned, it appeared that the best unit of traffic measurement of the expense was what we will term the equivalent ton miles, the total equivalent ton miles would be the sum of the following: double the freight locomotive mileage, times average weight per locomotives; four times the passenger locomotive mileage times average weight, total freight ton miles, (car and contents), double the passenger ton miles, (car and contents). This unit considers that one ton of passenger car does double the injury of one ton of freight car and that one ton of locomotive affects
1299 the track as much as two tons of the train back of the locomotive. This unit of measurement even, best fits the increase of maintenance of buildings due to increase of traffic and consequent increase in number and size of buildings. Passenger traffic demands a higher type and better grade of maintenance than freight and even a better type of shop buildings for repair."

Assume that that report was made, I want to ask you whether or not you agree with the statements therein made?

A. The statements therein made refer to the particular railroad

under examination, and I should judge from what was said that that was a railroad on which very high-speed passenger trains were operated. It is my judgment that in the case of such a road there is a very considerable amount of expenditure for maintenance that has to do with the comfort of passengers under those high speeds, and I think that, if the circumstances are such as I have related, the report of the eminent engineers in the case would have great weight in the case to which they refer, but I understood counsel to say that it referred to the case of a particular railroad which was under examination, and not to a road like the South Shore, on which speeds are comparatively slow.

I don't think that critical speed, so-called, may be as low as 27 miles an hour, as a practical matter, on the South Shore. The term "critical speed" is that speed at which the increasong injury due to elements attendant upon speed would begin to be marked—that speed at which, in a general sense, the elastic limit of the track structure as a whole would be reached. It is my opinion that on this road that limit will not be found under somewhere from 30 to 40 miles. It would be found on some of the passenger trains which made a higher speed than 27 miles an hour and are included in the average, but, also, it is a fact that freight trains on this road, particularly on descending grades, make speeds comparable with the higher speeds of passenger trains.

1300

I don't think that the greater cumulative vibration and greater impact would be found with the passenger engines, which average the 27 miles, rather than the freight engines which average 16 miles, because I think the cumulation of the impact would be found where there are many wheel impacts, as in the case of a long train, and freight trains are much longer than passenger trains. Critical sped may occur at any place on the track, in the sense that I have stated. In this sense, I think it would frequently occur with the freight trains on this road where there were no bridges or other openings in the embankments; I think more frequently on the passenger trains.

Cumulative vibration takes place on straight embankments, either level or uphill or downhill embankments. The vibration is of a part of the entire track structure together with the depression of the entire track structure caused by the passage of the train.

The heavy engine depresses the track structure so that even on a level track the engine is running uphill all the time, just like a man walking a slack rope, only lesser in degree. Right in front of the driving wheels, taking the weight, you always have the incline immediately due to weight. The springing back of the track, the rails and the part immediately below it, is a process that takes some time. It springs back in the major part quite quickly, and the remaining restoration takes a good deal longer, and where the train is long, and there are a number of wheel impacts, the effect becomes cumulative; that is to say, the succeeding wheels continue to strike the depressed portion, before it has risen. The impact is increased by reason of the rise in rails immediately ahead of the greater weight of the locomotive. In that connection, while the speed is greater the depression is less; therefore the effect

1301

that you (Butler) have compared to going uphill is less at high than at slow speeds.

Greater speed, or increased speed, tends to lessen this impact, because it doesn't settle so much as in the static load. In respect of that particular subdivision of impact, the greater speed lessens the effect. That is why the trains running at very high sped were determined in Germany to be supportable by a lighter track structure than the trains running at lower speeds. It is not the practice anywhere to have lighter structures for fast trains than you would have for the same trains if they went slow. I think that the fact is that the heavier structures are built to sustain the heavier weight of increasing train loads.

I think that speed is a factor, but I don't think that the practice of increasing the strength of bridges and the weight of rails has been occasioned by increases in speed. On the contrary, as a matter of common information and general knowledge, such increases in strength have been due to increases in train loads, and the increases in speed during recent years have not, as it were existed, i. e., the trains ran as fast 40 years ago as they do today, but they were not as heavy; it is the heavier trains that require the strengthening of tracks, the increased amounts of ballast, heavier rails and stronger bridges. Other things being equal, I would expect a structure to be strengthened as the speed increases up the "critical" point, used in the correct engineering sense of the term. Counsel will doubtless perceive that such critical point having been arrived at, the lighter structure would then be equally safe.

1302 THOMPSON.

Redirect examination.

By Mr. Wykes:

The reason I merely substracted the delays from the freight train time, and did not add it to the passenger train time, was that I conceived that the deduction of the delays for the freight trains ought to put the freight trains in the same position that they would have been in if they had not been delayed for passenger trains at all. Also, there were delays to passenger trains caused by freight trains that I might have taken into my computation to the disadvantage of the plaintiff but I did not do so.

That computation I made for Mr. Butler, which the time deducted from the freight trains would bear to the time of the passenger trains if added, was a mere mathematical computation that I made at his direction. I did not intend to have it appear that an addition of about 7% that I computed for him, to the passenger ratio of 30.32%, would produce the correct result; I have during the recess computed the percentage on Ratio 4 that should be used in case it is held that the delay caused to freight trains meeting passenger trains should be treated as a subject of addition to time of passenger trains, and I find that in that case, where my original percentages under Ratio 4 were, passenger 30.32% and freight 69.68%, the recomputed ratios would be, passenger 31.03% and

freight 68.97%. I obtained these figures by adding to the sum total of the elapsed minutes for passenger trains the amount deducted for delays of freight trains.

In making comparisons of operating ratios in the passenger department, it is necessary to know, before any comparison can be made which will be valuable, what distance above the normal operating ratio, or a correct operating ratio, the rates of fare or the
1303 revenue would be. If the operating ratio were 50% under rates of fare of 3 cents, that would be the equivalent of an operating ratio of 75% under rates of fare of two cents, and 65% substituting 2.6¢ for the 3 cents.

I was first engaged by the State in this proceeding in the spring of 1913, before the decision in the Minnesota Rate Case. I completed my report to testify before July 22nd, 1913, and appeared at Chicago for the purpose of testifying at that time. The Minnesota Rate Case having been decided at about that time, my testimony was put over from that time to sometime very much later, due to the changes made in the method of proof by the Minnesota Rate Case. From the time in July, 1913, that I was ready to testify, I have given very little attention to detail figures contained in the report. I have given attention, for the specific purpose of testifying, to the principles underlying my computations. At the time when I was to have testified originally, before the changes were made by the Minnesota Rate Case, I was intimately familiar with all of these detail- of figures. I did not think necessary to prepare in the same detail upon particulars that I had before, and confined myself to principles. I was familiar with the details at that time through my connection with their compilation, and I think I should continue to remain familiar with them if it had not been for the sickness spoken of; to get it up after that, would have required me to study over again the small details, and I have not had the time and strength to do it.

In the Mountain Ice Case, some of the principal divisions between passenger and freight were made on a revenue train mile basis. That basis is different from the basis which I used in this case. I used the revenue train mile basis in that case for these reasons:
1304 First, I had only a very short time allowed me in which to get up my figures in the Mountain Ice Case, namely, about three weeks, second, the records of the Lackawanna were not such as to allow me to discover the gross ton miles, and although I attempted to find it out, I had to give it up; third, that was the first time I had attempted to make a separation, and I was not familiar with the subject as I have since become, and I did the best I could, at that time, according to the light I then had.

I did not look up or refer to what was done by anybody else in such cases. I had no opportunity to. And my use of the train mile basis there followed the old, and what I think might properly be called the extinct, use of the train mile basis. I do not think it is now used in general, except for the purpose of statistical comparison one year with another on the same road.

I started to give the reasons why I had used the revenue train mile basis in the Mountain Ice Case, in certain particulars. I used it

because it was convenient and readily available, because I could not get figures which would have been more nearly responsive to the facts, and because I then was not very familiar with the subject, and the art at that time was in a very rudimentary state compared to that to which it has since advanced. The Mountain Ice Case was heard before Judge Prouty, of the I. C. C., in 1908.

I think the methods I have used in this case would be much more proper, but I think there were some of the methods I have used in this case that would not be equally applicable to the Lackawanna under its different conditions; i. e., to make a similar showing for the Lackawanna, I would not follow the methods I did before. I would follow a method much more near that I followed in this case.

1305 Q. Mr. Butler discussed with you at some length the proposition of adding the switching mileage to the revenue train mileage, on the freight side (both sides), in making divisions, and you stated that you thought that would reduce the element of error in the use of the revenue train mileage basis for division of common expenses. Do you remember who, in divisions of common expenses, ever used the revenue train mileage in that way with the addition of the switching mileage to freight?

A. The computations made by Price, Waterhouse & Co. include switching mileage with revenue mileage, and it is my recollection that Mr. Muller's computations do likewise in respect of some of the accounts, and I think also, speaking from memory, Mr. Worthington's do in some places.

On a number of occasions in my testimony I have referred to the question of accuracy permitted by the accounting records of the South Shore. The compilation of the set of records of the expenses of a railroad involves the constant application of the judgment of the accounting officers as to the accounts to which the items shall be charged and while there are provided rules to govern the accountants, nevertheless, there is necessarily a very considerable measure of judgment of the accountant required to be applied to the items. In so far as that judgment is correct or incorrect, so does the result produced by the accountant vary from correctness in respect of what he sets up to the accounts that he produces.

Q. You answered with regard to the question of whether your results were approximately accurate, and I think had some difficulty in getting to the point of saying that they were substantially or approximately accurate. What was it that induced that uncertainty in your mind?

1306 A. There were a number of things; the principal one was the lack of perfection of the records, when considered as records, for the purpose of making such a computation, and the lack of existing knowledge in the minds of any one or on the record anywhere as to the relative proportion of waste attributable to mechanical wear and weather stress in respect of various things, such as ties. Further if the records of the plaintiff charge against operating expenses any considerable amount spent for capital purposes, it would be included in my figures as cost of operation. I

was cognizant of the fact that there had been two appraisals of the property of this railroad made by Mr. Riggs, one about 1900 and the other about 1912 or thereabouts, and that the difference in costs of reproduction found by Mr. Riggs was very great, and that it was greater than the difference in unit costs which he applied against the items, and that this difference was not accounted for by capital charges on the books, and the necessary conclusions would be that the road had been improved at the charge of operating expenses.

I think that the correction of such errors as there may be in my work would result in decreasing the cost of intrastate passengers transported in Michigan, rather than to the increasing of it. By that I mean to say, the true resulting cost would be less than my figures rather than more.

When I mentioned a 10% range of error as being substantially accurate, I meant 5% either way from correct, a total of 10% margin of error or variation; I think my results would not be more than 5% above or 5% below the truth. If there were no greater variation than 5% from correctness, there would be substantial accuracy.

1307 I see no relation between the revenue train mile made on the Western Division and the cost of repairing a bridge on the Marquette division, or between a flagman stationed at a crossing in Marquette and a revenue train mile made on the line near St. Ignace. The flagmen are located in the yards in the centers, such as Marquette and other considerable towns on the line, more largely than in the country. The switching and train movements occur most frequently in those same yards.

THOMPSON.

Recross-examination.

By Mr. Cotton:

In the Lackawanna Mountain Ice Case, one of the reasons why I adopted the revenue train mile basis was that I only had about three weeks in which to prepare for examination. In stating them, I did not mean that was the most important. I cannot say that at that time the revenue train mile was universally used.

I took 2.75% of delay to freight trains out of the time of occupancy by these trains. I did it on the theory, as I have stated, a little while ago, that the deduction of the amount of time from the freight train time, to put the freight trains in the position that they would have been if there were no passenger trains to oppose them. It would have gotten to the terminal that much quicker.

Q. If it were lying on the freight track to the extent of 2.75%, that time, if it had not been for that delay, it would have utilized in its occupancy of the track, would it not, the main tracks, in getting to the terminal?

A. It would have utilized that time, and so much less at
1308 the end would have been required, so the elapsed time be-

tween terminals would have been the total elapsed time minus the delay, just as computed.

I do not think that 2.75% must be added to the time of occupancy of the passenger trains in order to have exact equality; it seemed to me that that was a point on which I might be overruled and therefore I computed the difference in per cents and stated them this afternoon, showing that the passenger percentage would rise from 30.32% to 31.03% on the time ratio, and that the freight percentage would fall from 69.68% to 68.97%. The difference would not make very material variation in the results.

Q. As a matter of fact, you were complimented by the Commission on the work that you did in this Lackawanna case, for accuracy and correctness in your divisions of this common expense; is that true?

A. I was complimented by Judge Prouty of the Commission for the care in which I did my work and particularly for the conscientiousness in respect of not endeavoring to make a result showing one way or the other.

Q. And that care and conscientiousness involved the use of the revenue train mile basis in a division of this common expense did it not?

A. I cannot answer that yes or no without stating other considerations, known to the court, namely, the short time I had for preparation. I do not think that Commissioner Prouty meant to compliment me on the use of the train mile basis. My recollection is that Judge Prouty expressed some criticism of the train mile basis indicating it was more valuable for merely statistical purposes than for the truth of separations. I am stating that wholly on my memory, and would not swear that is true without consulting the record, but I think that is true.

Q. When Mr. Butler first brought this Mountain Ice Case
1309 to your attention, your memory of what you did there was so perfect that you could not recall what particular method or basis you used at all, is not that true?

A. That is not true. I have seen lawyers read untruthfully from a printed statement, and I desired to guard myself against the possibility of Mr. Butler doing it. I do not mean to imply that I think Mr. Butler would, but I wanted to be sure he was not.

Q. But you have given the impression upon the record that you were not certain what method you did employ there until Mr. Butler read from the brief the method that you employed?

A. I do not know what impression I gave on the record, I know that in my own mind I was not prepared to testify specifically, as to each and every item of 116 accounts, just the method I used 6 years ago.

My second reason for using the revenue train mile basis in that case was that the records of the Lackawanna road were such as not to permit me to use any other basis. The records were not such as to make it possible, within any reasonable length of time, to compute or even estimate the gross ton mileage. Furthermore, there were complications in respect of the suburban passenger traffic, the correct

elimination of the error due to which, or the inference of which, would have taken a great deal of time and effort and for which the books of the Lackawanna were not so constructed as to yield the information. This was 1908, and the accounts examined were the accounts for the first year after the installation of the I. C. C. classification, under the Hepburn Act. At that time, there was great difficulty in that, do the best they might to make their accounts conform to the new classifications; there were a number of differences
1310 which I cannot relate, but they were in general attempting to conform to the classification.

In making the statement, that one of the reasons why I used the revenue train mile basis then and swore to it as a proper method of divisions was because the records of the Lackawanna road were not kept as they should be, I had no reference whatsoever, and I think counsel knows it well, to the question as to whether the records of the Lackawanna conformed to the records or requirements of the I. C. C.; it has nothing to do with the case at all in respect of my answer. I would like to say that the classification of accounts for Additions and Betterments was in an imperfect state during the first year after the installation of the new system of accounts, and that is why I thought that the accounts, Maintenance of Way and Equipment, might not have been quite correct.

Assuming the Lackawanna accounts did follow the I. C. C. classification, my answer would still be that the accounts did not afford the information I needed. I do not think there would have been any differences between the accounts of the Lackawanna at that time and the South Shore at that time (1908). The accounting departments had the same troubles. I think the accounts of either road during that year and the present time, being compared, it would be found that the accounts at the present time are kept more directly responsive to the requirements of the Interstate Commerce Commission. It was impossible to make all of those changes accurately at once on the short notice that the gentlemen had.

My third reason for using that method was because it was my first attempt at separation of common items of expense between passenger and freight. I believe this is the third time I have tried it.
1311 The second attempt was to analyze Mr. Hillman's work in the Minnesota litigation. When I made that division and swore to it, I thought it was as nearly correct as the accounts made it possible to get at the truth. I do not think it was a pretty close approximation, in view of my subsequent knowledge. I think I got the result too low. If I did it over again, I would find it cost more to transport ice. I did not look up what other engineers and experts and accountants were doing in the matter. I had no time to do it; I was given 3 weeks to complete my compilation.

Price, Waterhour & Company, in the employ of the New York, New Haven and Hartford, about 3 years ago, in the Railway Mail Pay inquiry, divided account 2, Ballast, on the revenue train mileage basis including switching; also accounts 3, Ties, 4, Rails, 5, Other Track Material, 6, Roadway and Track, 7, Removal of Snow, Sand and Ice, 8, Tunnels, 9, Bridges, Trestles and Culverts, 10, Over and

Under Grade Crossings, 11, Grade Crossings, Fences, Cattle Guards and Signs, 12, Snow and Sand Fences and Snowsheds, and 13, Signals and Interlocking Plants. The statement which I have before me describes Price, Waterhouse & Co.'s method: "Direct where possible and apportioned on the basis of suitable relative ratios and on the ratio of assigned items."

Mr. Muller used a ratio that involved the same basis of revenue train miles. His description of his ratio used for account 2, Ballast, is: "One half on locomotive miles including switching. One half being the remainder half and likewise in respect of its ties, rails, and other track material and of roadway and track, of tunnels, bridges and trestles and culverts, and perhaps some others."

Q. Am I right in saying whether the principal factor in what you have just read would not be simply a method of the revenue train mile bases after all?

1312 A. Yes, but I think the modification would be very material and that it would be almost all on the side of increasing the freight revenue train mileage, and not the passenger revenue train mileage. I base that on my general knowledge of the fact that the amount of switching done in the freight business is enormously greater than that done in the passenger business everywhere. Mr. Peabody, Statistician of the Santa Fe, has used the revenue train mile basis on some of the common items.

Q. Now at the time that you were doing this work in the Mountain Ice Case, the consensus of opinion among the very best engineers competent to do this sort of work was that the revenue train mile basis, everything considered, was the best and most practical and efficient method to be employed in the division of these common items of expense, Maintenance of Way and Structures?

A. I do not believe that; I do not believe there was any consensus of opinion. I do not think the competent accountants and engineers generally had considered the subject carefully with intent to arrive at correct result. To answer as to the Pennsylvania or the New Haven, or any other road, I believe that it is not a suitable basis for any of them. It might follow out that its results would in isolated cases coincide with the results of a correct computation, but I think that would be a mere arithmetical accident and have nothing to do with the correctness of the method.

Q. But you would expect the officers and engineers of the Pennsylvania Railroad to be pretty competent and pretty well experienced in matters of this sort, would you not?

1313 A. Well, I am going to answer you as well as I can; that is not a question I can answer yes or no. My answer to that is that my opinion of the men would depend upon my notion of what the Pennsylvania Railroad was trying to use those figures for.

Q. Don't you know, as a matter of fact, they have used this revenue train mile basis for many years?

A. Yes, I do. I, further, have been told by representatives of the Pennsylvania Railroad that they do not think it was of any value. I wish to say though, Mr. Counsellor, while I have no intent and

do not wish to introduce or endeavor to bring into my testimony hearsay as testimony, it is true that those things affect my own judgment when I am told them by other people.

Q. Did I understand you to say in your re-direct examination that, if you were to add the switching mileage in this case to your revenue train mile basis, it would reduce any factor of error that you thought there was in the ratio almost to a minimum?

A. No sir, what I intended to say was, not referring to my computation at all, but referring to computations introduced by the complainant, that if the basis of division used by complainant, namely, revenue train miles, were amended, and in its place there were used a basis of division obtained by adding to the revenue miles the switching miles, then I thought that the amount of error contained in the complainant's computations would be reduced.

I admit, and have admitted, and continue to admit unhesitatingly, the elements of imperfection in my computation here because of the imperfection of the records of the railroad. That same imperfection exists as to all railroads in the country generally. The inter
1314 passenger service in Michigan is in fact and in truth more expensive than the intra, undoubtedly to the extent that it is more expensive to handle the accounting for interline passengers than it is to handle the accounting for line passenger business, and we know the larger part of the interstate business is interline relatively than of the intrastate. The lack of information on this subject produced an element of error.

When I say I have not taken this into account, by that is meant I have not loaded the cost of intrastate (inter) business with that item. I do not concede that the intra passenger business on this road in Michigan is more expensive than any other passenger business—that is, than the inter passenger business. I would say, in respect of some of the items it is more expensive, and in respect of some other items it is not, but as to the total amount I am not prepared to say whether it is or is not.

THOMPSON.

Redirect examination.

By Mr. Wykes:

I did not find any record of the South Shore which kept the revenue train mileage by divisions, or by other divisions or sections of the road than the whole. If that basis were to be used, it would be valuable to have the revenue train mile by divisions, as it would diminish the error to segregate the expenses so far as possible into divisions and use the train mile ratio against the division. I did not find any record of the cost of maintaining exclusive freight tracks on the South Shore; what I mean by that is, I found an accumulation of records that could be referred to. There are records of individual expenditures, item by item, that have gone on these exclusive
1315 freight tracks, but they have been merged in the compilation with the other. I found no total separate from the total of the whole road for a similar item.

I did not find any record of revenue train mileage on the exclusive freight tracks, no detail of the switching movement which took place in the first hour at particular places and the reduction of that to miles, nor any record of the switching movement of passenger train cars or of freight train cars separately, nor any separation of the cost of interchange carload lots or less than carload lots, either or both, with other roads. There are none of these things that it would not be material to know if I were making precise separations.

Q. Where any so-called allocation depends upon the use of arbitrary figures, such as locomotive miles or train miles, or features of that character, would you term that an allocation?

A. No sir, that is not an allocation at all; it is a misuse of the term; it is an assignment by computation.

Q. Now getting a little closer to it. Such items as lubricants for road locomotives, assigned on the basis of the fuel for road locomotives, would you term that an allocation or assignment?

A. I would term it a computed assignment.

Q. Take where an item such as fuel, so far as it was common or used in a locomotive in the common service for the time being, and being assigned on the relative mileage in each of the two services, would you term that an allocation?

A. No sir, that is not an allocation; it is a computed assignment like unto other computed assignments.

Q. Is the revenue train mileage basis reliable and accurate for statistical purposes, for comparing the operations or happen-
1316 ings in passenger department in one year against the similar operations or happenings in the passenger department for another year?

A. Under some circumstances it is; what I mean by that is that if the conditions remained relatively unchanged the train mileage basis division becomes an informative statistical method for telling the management what is going on relatively this year with what went on last year, but it becomes unreliable even for that purpose when the flow of traffic or the conditions of traffic on the system does change between one year and another.

Q. Where it is reliable, that is, where conditions remain practically the same with no abnormal changes, is that because it is the comparison of likes?

A. Yes. The value is to show whether the like expenses, for instance, in the passenger department or in the freight department one year with another, have changed.

Q. Now, is its use by railroad companies for statistical purposes for such comparison any argument for its use in a comparison of unlikes, such as the freight and passenger sides?

A. Absolutely none whatever.

Q. Can you find the Buell case (1 Wis. C. R. 101-102), — which Mr. Butler referred in the examination today, where he stated the claim of the railroad companies in that case to have been that the passenger mile was more expensive than the freight train mile? Do you find there a table which contains an examination of statistics

for maintenance of way and for other costs for different railroads? I ask you to read the table.

1317 A. "The formula in question was designed to show that speed was relatively more injurious to the rail and track than weight; or, which is possibly more accurate, to give consideration to both speed and tonnage. It is quite intricate and when applied allots an unduly large proportion of the expenses to the passenger traffic. It appears to be at variance with most other theories of apportionment and with a common sense view of the situation. The formula was submitted for examination to Prof. W. D. Pense of the engineering department of the University of Wisconsin. In his report upon this examination Prof. Pense criticises the formula itself as well as the basis upon which it rests. He also offers some general observations based upon experience or actual tests which, in substance, show that speed is not relatively more injurious to rail and track than weight if as much so. Some of his observations are:

"The wear of the wheel tread is a good basis for estimating the wear of rails.

"The wear of drivers is more rapid on freight than on passenger locomotives.

"The wear of drivers on passenger locomotives is not increased as speed increased.

"Hammer blow of drivers is frequently more injurious to rails with freight service than with passenger.

"Passenger rolling stock is less severe on the track and structures than freight cars.

"Rail defections and roadbed pressures do not increase directly as the speed.

"Cost of raising and tamping track is not increased with
1318 increased proportion of passenger trains.

"The renewals are chiefly due to decay.

"These are substantially the conclusions at which Prof. Pense arrived. They are based on such experiments and observed facts in relation to this matter as have been made and published and it is felt that they are entitled to a great deal of consideration.

"If the passenger trains caused relatively so much more damage to the rails and track than the freight trains as the Company would have us believe, then the cost of maintenance of way should be relatively greater on those roads where the passenger traffic predominates than on those where the freight traffic is the heaviest. Yet this is not the case as the following table demonstrates."

1319 *Cost in Cents per Revenue Train Mile.*

	No. of years included.	Repairs of roadway.	Renewal of rails.	Renewal of ties.	Total roadway, rails, and ties.	Repair and renewal of bridges and culverts.	Total roadway, rails, ties, bridges, and culverts.	Maintenance of way and structures.	Passenger per cent of total revenue train mile.

THIS PAGE BOUND

1320 Q. You spoke of certain appraisals made of the South Shore in periods ten years apart? Now, if it should be the fact that in addition to the two appraisals ten years apart there were two appraisals one of which was one of the two that you have referred to, two years apart, and then an analysis of the results of those two appraisals, a reconciliation and a reduction of the items to the same items in each appraisal were made which indicated (on the same prices and on the same inventory each time, the inventory containing such general items as the right of way, roadway and track, and track structure and so on, in different items) there had been an increase of $300,000 in the two years, this all being over and above additions and betterments, would that indicate that there might be an error in your result to the effect or in the way of your results being stated too high in cost?

A. Yes.

I find that the average haul of intrastate passengers in this case is shown to be something under forty miles. That indicates to me that the vast bulk of intrastate passengers are short-haul passengers and have no use for sleepers and diners, and I do not think they should be charged with the expense of maintaining the hauling of sleepers and diners. I think the long-haul passengers should do it, and I think, whether the longhaul passenger is intrastate passenger or interstate passenger, he should pay for the service which he gets and the other fellow does not get.

I think if a man who used the sleeper paid the full value for his service, over and above the mere transportation, then the cost accounts should be kept separate. I am not criticising the management in respect of maintaining the service, but criticise the apportionment of the cost of that service against the pure cost

1321 of transportation.

I mean, in showing the cost of carrying passengers as such, what railroads call transportation, as separate from Pullman, for instance, and in showing the cost of transportation as such, I think we ought to show the cost separate, and that the cost of the special hotel facilities should be paid for by the people who avail themselves of them. Assuming the entire sleeper and diner service of the South Shore were on the Houghton Branch, there would not be any justification or any reason for charging any part of that sleeper and diner against the passenger traveling on the other parts of the line, where there was no such service. I think there is no greater warrant for charging any part of that service against the short-haul passenger who does not use it than there would be in charging it if it were carried on only a part of the line against the other parts of the line.

THOMPSON.

Recross-examination.

By Mr. Eldredge:

Q. Mr. Wykes had you figure out certain percentages on a basis of 2.6 cents per mile passenger charge and 2 cents passenger charge, and they were, as I take it, what Mr. Wykes assumed and you assumed to be the proper percentages, which Mr. Butler should have used in certain questions that he put to you this morning, where he used the percentage- of 44.7 and 57.7. Had those percentages which Mr. Wykes had you figure been used by Mr. Butler in his questions, where he used the 44.7 and 57.7 percentages, your answer to Mr. Butler would have been the same?

1322 A. I take it you are now inquiring as to Mr. Butler's final hypothetical question, in which he put in all the assumptions and enlarged his question and made no qualifications. There is a difference between his questions. He asked a series of questions in which he did not assume all the assumptions, and then he asked one question which was confined entirely to assumptions and that question I answered "Yes," without any attempt to qualify it, and I did so because it seemed to me the fact that these eastern roads were operating generally on two-cent fares or less and your road was operating on three cent fare, it was so obvious it was the only answer for me, and I answered yes.

Q. The questions of Mr. Butler to which I refer are those which he asked you in reference to results obtained by certain eastern roads which he named on quoting from Mr. Brandeis' argument to the Interstate Commerce Commission. You understand those are the questions I refer to?

A. Yes, I understand that.

Q. Now, if Mr. Butler, instead of the percentages which he used in those questions, had used the percentages which Mr. Wykes had you figure here and to which I have referred, your answer to Mr. Butler would have been the same?

A. I will answer yes, now, because, as I understand it, I should answer yes, and if I find any reason to modify it I will do so, and give my reasons.

Mr. Wykes: One thing further that may clear this up a little: Just generally, and assuming the average rate of income for passenger to be 2.6 cents per mile traveled and the operating ratio for passengers found on that to be 57.7, call it 58 for convenience, what

1323 would be the operating ratio on the basis of a revenue reduced to two cents?

A. Approximately 75½ per cent.

(It is agreed that the tabulations which appear on record pages 9860 to 9881, from Thompson's Appendix A, may be marked Defts.' Ex. 72*a* and filed with the clerk and returned as an exhibit.)

UNITED STATES OF AMERICA,
Eastern District of Michigan, ss:

I, Elmer W. Voorheis, Clerk of the District Court of the United States for the Eastern District of Michigan, do hereby certify that the above and foregoing is a true copy of Volume 3 of Narrative Statement of Testimony on Appeal comprising typewritten pages numbered eight hundred and ninety-three to one thousand three hundred and twenty-three inclusive, in the therein entitled cause as the same appears on file and of record in my office; that I have compared the same with the original, and it is a true and correct transcript therefrom and of the whole thereof.

In testimony whereof, I have hereunto set my hand and affixed the seal of said Court, at Detroit, in said district, this twenty-first day of November, in the year of our Lord one thousand nine hundred and eighteen, and of the Independence of the United States of America the one hundred and forty-third.

[Seal of the U. S. District Court, Eastern District of Mich.]

ELMER W. VOORHEIS, *Clerk.*

1324 Vol. 4.

On June 4, 1914.

AUGUSTUS C. HONE, a witness called by defendant.

This witness, an engineer on the staff of M. W. Thompson, had charge of making the computations entering into Defts.' Ex. 72, Thompson. He testified to the correctness of the computations, and that the method outlined by Thompson, and in Defts.' Ex. 72, Thompson, had been carefully carried out and checked, and every effort to secure accuracy followed, that there was no attempt to go back of Mr. Delf's records, and that the totals used were taken from plaintiff's records, with one or two exceptions. The exceptions were for the purpose of using averages to normalize unusual expenditures, as in ballast. The detailed sheets of the computation show all such variations, and the methods pursued.

1325 On June 5, 1914,

ALBERT R. DILLEY, a witness called by defendants.

Direct examination.

By Mr. Wykes:

(Mr. Wykes produced a chart, marked Defts.' Ex. 99 (should be 71), Dilley, June 2, 1914.)

I have compared that chart with the stipulation between Mr. Eldredge and myself, and I have underlined in the chart all of the things which are taken from or which are contained in the stipulation.

Mr. Wykes: The stipulation is to govern, and there is nothing intended to be in the chart that is not in, and a part of, the stipulation.

1326 On June 25, 1914.

ROLLAND C. ALLEN, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I have been employed for five years as State Geologist of Michigan. Previously was instructor in Geology in University of Michigan, one year; was connected with Michigan State Geological Department for a short time, before appointment as State Geologist. I was a year ago last January appointed by the State Tax Commissioners as appraiser of Michigan mines. Since, I have made two complete ap-

praisals of the iron mines and one of the coal mines in Michigan. It was necessary for me to locate the ore formation and ore bodies in the Upper Peninsula.

As expert for Tax Commission, the records which come to my office are variable in character. Each mining company, operator or owner of an iron mine, is required to submit to the Board of State Tax Commissioners maps showing all of their underground workings—records of their drillings and other explorations. This is used by me in appraising these properties for taxation. In addition, I use a vast fund of other information, accumulated by geologists for many years in the mining regions.

The ore formations in Upper Peninsula are indicated by the geological surveys of the Federal Government and of Michigan, and by the work of individual geologists. In certain localities, the information regarding the existence of iron ore in formations is so precise and complete that we can make definite statements regarding its presence or absence, but for a large part of the area known to be underlaid by ore bearing formation we are unable to state definitely the
1327 presence or absence of commercial iron ore. The presence of a known ore bearing formation indicates possibility of occurrence of commercial bodies of ore, until exploration and geologic research proves the contrary.

The reports submitted to me contain records of the drillings and explorations made by mining companies in the iron ore district around Ishpeming and Negaunee. These reports are verified, on oath of the makers, and by personal examinations of myself and assistants where possible.

I am familiar with the line of the South Shore as it leaves Marquette, runs westerly through Ishpeming, Negaunee, Champion and Michigamme. I know the location of the line and the sections and subdivisions crossed.

This (Defts.' Ex. 73, Allen) is a map of the D.S.S.&A. in two parts, the first part from mile post 163 to mile post 173 and the second part from mile post 178 to mile post 198. This map shows not only location of main lines of D. S. S. & A., but also the geology of the adjacent country on either side of the track, and particularly the area underlain by the iron bearing formations of the Marquette Range, and in that formation the location of known bodies of ore, and the location of drill holes which have penetrated iron ore, showing the depth at which iron ore was penetrated and its thickness in each hole which encountered iron ore. It does not show drillings where no ore was encountered, except such as are immediately adjacent to D. S. S. & A. tracks. The holes which penetrated ore are indicated by red circles, and thickness of ore by red figures. Other figures in
1328 black show depths at which iron ore is encountered. The known ore bodies are enclosed on the map, in dashed red lines, inside which is shown the position, depth and areas of the bottom working levels of mines operating. I have omitted from the map ore bodies a considerable distance from plaintiff's tracks.

The only known ore under main line tracks of plaintiff's on the Marquette Range is that of the Cliff shaft mine, crossed by the road near mile post 170, in Negaunee. In making my map, I excluded

those lines engaged exclusively in ore business, and confined myself to main lines used in passenger business. The ore body adjacent to mile post 170 has been, and is now being, worked under plaintiff's tracks. From Marquette to mile post 165, plaintiff's right of way crosses rocks in which there are no known possibilities for the occurrence of iron ore.

At mile post 165, the road encounters the iron bearing formation, and to mile post 169¼, except for a very short distance, in sections 6 and 1, it runs across ore bearing formation. From mile post 169¼ west to mile post 172, the main line crosses Goodrich quartzite formation. This quartzite overlies the Negaunee iron bearing formation and the workings of the Cliff shaft, Lake Superior hard ore, and Section 16 mines, adjacent to the tracks, have penetrated this quartzite into the ore bearing or Negaunee formation below.

From mile post 165 to near mile post 166, the right of way is coincident with the crest of an anticline or arch in the Negaunee ore bearing formation. Such situations are in the Marquette range unfavorable to the occurrence of ore. I recall no occurrence of a commercial body of ore in such a situation on this range.
1329 Therefore, we must conclude that, while the occurrence of ore under the right of way, mile post 165 to near mile post 166, is possible, the possibility is remote and not such as to lend any considerable value to the acreage of the right of way. As illustrating the position of the right of way, mile post 165 to mile post 166, with reference to the geologic structure in the iron bearing formation, the occurrence of the ore bodies in the synclines and the absence of them on the tops or crests of the arches or anticlines, I have drawn a cross-section along the line C, D which it appended to the map. That cross-section is approximately a mile and indicates a general law governing occurrences of ore bodies in the Marquette district. It is: Ore bodies in the Marquette district, speaking now of the soft ores which occur in this immediate vicinity—soft ore bodes show, by the known facts of their occurrence, a decided preference for synclines and almost a complete avoidance of anticlines or arches.

The ore bodies in the Marquette district occur in rock, known as the ore bearing formation, which in the Marquette district varies from a few hundred feet up to 1,400 feet in thickness. A composite analysis of the entire formation would show a content of iron of not less than 25%. Commercial ore must, under present conditions, average above 49% with the exception of certain siliceous grades, of which comparatively small tonnages are mined and used to mix with higher grades. If commercial ore must contain at least 49% iron, and the iron bearing formation as a whole contains on the average only 25% iron, it is apparent that the ore bodies are the richer parts of the iron bearing formation; these ore bodies were not
1330 present in the unaltered iron formation through which the iron was more evenly distributed.

The iron bearing formation, as originally deposited, differed in many ways from is present condition. The important differences are: The iron bearing formation in original form was a rock con-

taining iron and silica, with subordinate amounts of alumina, lime, magnesia, etc. The iron was in ferrous condition; i. e., the proportion of oxygen to iron in the ferrous condition is less than in the ferric condition. This rock, containing the above constitutents with the iron in ferrous condition, is the original or unaltered iron formation. Any chemical change in the constitution of this rock or its component minerals is a chemical alteration of the iron formation which has been a large factor in the concentration of ore bodies.

The iron formation at present is partly altered and partly unaltered. The unaltered parts of the iron formation are, in that part of the formation which is open to inspection, very subordinate to the altered parts, but in those isolated places where the natural conditions are such that alteration takes place with extreme difficulty or slowness, the iron formation is in an unaltered or relatively unaltered condition. The formation *or* ore bodies is a process of alteration, and represents one of the extreme phases of alteration through the action of underground waters, which operate to dissolve silica and oxidize the iron content of the formation from the ferrous to the ferric condition. Underground waters are the only known agents competent to affect, on a large scale, solution of silica and oxidation of iron. As this phase of alteration is accomplished by underground waters, it is a certain inference that the alteration will proceed most rapidly and to best effect in those parts
1331 of the iron formation where the underground waters flow most freely or are concentrated in underground trunk channels of circulation.

Any geologic structure, therefore, which forms a natural trough with an impervious bottom, becomes a channel of underground water circulation. The synclines form, with their bottoms of slate or other impervious rocks, natural trunk channels or underground water circulation, and it is in these situations that the soft ore bodies are formed. These synclines exist by reason of the deformation by folding or compression, by mountain building forces, of the iron formation, and its associated upper and lower sedimentary formations. Following this deformation, the country has been reduced by erosion, so there are today exposed the stumps of ancient mountains, and the plane of erosion or surface of the ground today cuts across, indifferently, anticlines and synclines; so that these structures, which were once complete, are now cut across or sectioned by the plane of erosion, which is the ground's surface.

The above applies to the concentration of the soft ores of the Marquette range, and not to the hard ore bodies which occur in the top of the formation and characteristically just under or near contact with the overlying Goodrich quartzite.

Figuratively speaking, the right of way in the vicinity of mile post 166 descends from the crest of the anticline, or arch, and cuts obliquely across the axis of the great Maas-Negaunee syncline or basin. The axis of the syncline may be taken as the central or median line, or a line coincident with the lowest point of the trough, running lengthwise of the syncline.

1332 In my opinion, the Maas-Negaunee trough or basin contains one of the greatest ore reserves in Michigan. The working of the Maas and Negaunee mines, and the numerous drill holes

west of these workings, or down the pitch of the trough, show that in all probability there is an almost, if not quite, continuous body of iron ore occupying all or nearly all of that part of the ore basin enclosed by the red dashed line on the map, which lies east of Healey Ave., in Negaunee. To my knowledge, there are no drill holes in this basin which penetrate ore at depth, west of Brown Ave., in Negaunee, until we reach the S. E. ¼ of N. E. ¼ of section 1, where, near the east central side of this description, ore occurs between 2,100 and 2,205 feet, and near the western side, and about 300 feet south of the former, ore is shown by a drill hole between the depths of 2,784 and 2,990 feet, and below.

Examination of the workings of the Maas and Negaunee mines, and of the records of drill holes in the Maas-Negaunee basin, shows clearly a westward pitching synclinal trough, which carries ore in the area above referred to, and presumably more or less continuously farther west across section 6 and into section 1. This trough is crossed obliquely by the D. S. S. & A. from near mile post 165 to about mile post 167½. No ore is known to exist in this trough under the right of way. It is my opinion that ore does exist under the right of way in some places and possibly for a considerable part of the entire distance The depth of this possible ore, as indicated by drilling and by the known structure of the Maas-Negaunee basin, will be from 600 feet, near mile post 166, gradually deepening to the west under the track, until in section 1, near a point 1,320 feet east of the center of the section, it becomes probably nowhere less than 2,000 feet,
1333 and probably 2,700 or 3,000 feet, in depth. It is possible that small bodies of ore may occur anywhere in the Negaunee formation within the limits of the Maas-Negaunee trough, but the great body of ore has been demonstrated to be in the bottom of the ore bearing formation or trough.

It is difficult, if not impossible, to mine a large body of soft iron ore, particularly if above (less than) twelve to fifteen hundred feet, without material disturbance of the surface of the ground by caving. As the thickness of rock above the ore body increases, the disturbance of the surface, as a result of caving at great depths, becomes progressively less, as the breaking up of great thickness of cap rock creates an enormous number of small voids which operate to swell the volume of the caved rock; so a large cavity at great depth may be filled by caving and breaking of the overlying cap rock without material disturbance of the surface.

Applying this to the question of what would happen to the D. S. S. & A. railroad were ore to be mined beneath it and the void permitted to fill by breaking and caving of the rock above it, it may be said that ore lying at great depth (2,000 feet or more) could be mined and the ground above permitted to cave without material disturbance of the surface; such disturbance or sinking of roadbed could easily be counterbalanced by filling as the subsidence progressed. The subsidence would be slow. I make this statement in respect to effect of caving from the knowledge gained from observation of results of caving in many iron mines throughout Michigan.

Beyond section 1, in Negaunee, west to mile post 170, there is to my

knowledge no known commercial ore bodies of any value be-
1334 neath or immediately adjacent to the plaintiff's right of way.

The road crosses underground workings of the Cliff shaft mine in Ishpeming, near mile post 170, and ore occurs under the right of way. The Cleveland Cliffs Iron Co. is mining hard ore at various depths down to 987 feet, under Ishpeming, and are preventing caving or movement, by leaving supporting pillars of approximately 30% of the ore. Such mining wouldn't be possible with the same favorable result in soft ore.

It is probably the fact though not certain, that an ore body extends across the right of way between approximately 10 and 30 rods west from mile post 170, in Ishpeming. This ore body lies at moderate depth, not greater than 250 to 300 feet, beneath the track. In my opinion, this ore can be mined, as in the Cliff shaft mine, without disturbing the surface under or adjacent to the D. S. S. & A.

From about 40 rods west of the Cleveland shaft, mile post 170, west, there are no ore bodies known to lie beneath the main line of D. S. S. & A. There is a reasonable probability that some ore bodies do occur between mile posts 170 and 172, and, if they do, they may, in all reasonable probability be mined without disturbing the surface or caving the right of way of the railroad, as ores in this vicinity, and particularly in the top of the ore bearing formation at or near the contact with overlying quartzite, are hard, and may be mined by the room and pillar method, leaving sufficient ore to support the openings. This need not be over 30% of the ore. The Goodrich quartzite which underlies the right of way, mile post 169¼ to mile post
172, is a very hard, strong rock, capping the underlying ore
1335 bearing formation, thus rendering the supporting of openings in the ore bearing formations much easier than otherwise.

The hard ore is mined to a depth of 987 feet in the Cliff shaft mine, and approximately the same in the hard ore mines in sections 9 and 16.

Mile post 172 to mile post 190, near Michigamme station, the main track of plaintiff is underlain by rocks not known to contain iron ore. Within the Michigamme formation are local lenses or ferruginous rocks, and mining operations have been attempted on some of those ferruginous layers, but with uniform financial failure.

Near mile post 190, the main track crosses, for ⅜ of a mile, the Negaunee iron bearing formation. Also, from mile post 192 to mile post 192¼, and from mile post 194¼ to mile post 197¼, beyond which the track does not cross iron bearing rock. The ore bearing formation, mile post 190 to mile post 198, and beyond, is hard, siliceous and lean. While some ore has been mined at Michigamme and other locations on this belt of Negaunee formation, no mines are at present operating, and I know of no plans for operations on this belt. If commercial ore should be discovered here, it is probable, as in the hard ore area in the vicinity of Ishpeming, that openings could be made under the track for the purpose of extracting such ore without danger of disturbing the tracks.

Approximately parallel with the main track of the railroad, from mile post 188 to beyond mile post 198, and in two parallel belts,

from section 32, town 47 north, 29 west, to the N. E. corner of section
21, town 48 north, 31 west, brings us to the Beaufort mine, a
1336 formation known as the Bijiki schist, which, in certain parts,
is ore bearing, as at the Imperial, Portland and other mines west of Michigamme. The Bijiki schist lies entirely to the south of the D. S. S. & A., from mile post 198 to the vicinity of mile post 188, where the road turns to the southeast and crosses three belts of it; no ore is known to exist in the Bijiki schist in the vicinity of its crossing by the railroad. No ore has ever been mined or is known to occur in commercial quantities in this formation east of mile post 193. That portion of the Bijiki schist known to be ore bearing lies entirely south of the railroad, where mining can have no possible relation to the operation of the D. S. S. & A. So far as I know, there are no iron ore formations under the track west of mile post 198.

The Champion mine lies south of mile post 187. I have shown the position of the 32nd or 1907 foot level on this map, which is the level nearest the main track; at that point it is hard ore formation. Except the Bijiki schist member, which is not the same as mined at the Champion mine, there is no ore bearing formation under the track at that point. The known ore does not extend under the main line track within approximately a half a mile.

The lowest workings in the Champion mine (Ishpeming-Negaunee district) are approximately 2,300 feet. I would correct my statement, that the level shown on Defts.' Ex. 73, Allen, as the 1907 foot level is the working nearest the main line track, as the ore leans; the formation dips very steeply toward the track, and successive lower levels are slightly nearer the track. The lowest level at which mining operations are being carried on in soft ore formation is
1337 about 1,400 feet, in the Hartford or Cambrai mines; the ore in most of these deposits somewhere comes to the rock surface and is followed down.

The pitch or incline of the ore body, when followed down, may carry it beneath one thousand or two thousand feet of rock capping. That would correspond with the pitch of the ore bed, and the pitch of the ore bed may or may nor bear close relation to the inclination of the formation.

There is no probability of ore in every foot of the area described from mile post 166 west to the hard ore formation; if discovered in one place, it would not mean the entire area there was underlain with ore. There is a probability that ore beds would be encountered; it would be impossible to state the dimensions or extent. I could only guess at the percentage of formation where commercial ore could be found.

I hesitate to fix ranges within which the percentage might fall with reasonable certainty, without taking time to make an actual calculation of the area underlain by the ore bearing formation and the area underlain by known ore beds, for the purpose of getting a ratio on which to hazard a guess as to that part of the formation not thoroughly explored. Any statement of percentage—one or thirty—or any range between, would be a guess, in the absence of calculations to ascertain the ratio between the areas of known ore in formation

thoroughly explored and the area known not ore bearing, in the same area. Even there I would be speculating upon the feature of finding ore beds in the unexplored part in the same proportion as found in the explored part.

It is my opinion that, if five per cent of the total area of the iron formation exposed in the Marquette range is found to be un-
1338 derlain by ore after thorough exploration, the condition will meet fully the probabilities as they exist today. I do not think more than five per cent of the area of exposed iron formation in the Marquette range will ever be found to be underlain by iron ore, and my opinion is that the area ultimately found to be underlain by iron ore will be less than five per cent. I base the opinion on this, for one thing: The Mesaba Iron range has been thoroughly explored, by drilling closely spaced holes over a considerable part of its area, with the result that between 7% and 8% of the area of the ore bearing part of the Mesaba range is underlain by iron ore. The Mesaba iron range is a thick, gently southward dipping rock bed about a thousand feet thick, and the ore beds which occur in the exposed part of this formation have their greatest dimensions in a horizontal rather than vertical plane.

If the ore beds on the Mesaba range had their greatest dimensions in a vertical, rather than horizontal, plane, the surface area occupied by ore would be very much less than it is under existing conditions. The Mesaba iron formation contains more ore by volume, according to calculations, than does the ore bearing formation of the Marquette range. A very considerable part of the ore beds in the Marquette range have a large vertical component, and this fact, coupled with calculations, would render extremely reasonable, if not certain, the truth of the inference that the areas underlain by ore on the Marquette range are less in proportion to the total area underlain by iron formation than on the Mesaba range.

The presence of an ore bed a thousand feet down, a quarter of a mile from the track, does not carry with it the inference that
1339 there would be ore adjacent to that under the track, at that depth.

If the drill holes in the S. E. ¼ of N. E. ¼ of section 1, Negaunee, penetrated the same sheet of ore as is now being mined at the Maas and Negaunee mines, a comparison of the depth of the ore, there with that here, gives a measure of the pitch of the Maas-Negaunee trough. Assuming the same pitch as exists between the Maas and Negaunee mines, 450 feet in 650 feet for every 3 feet horizontally, it would dip two feet—approximately 33 degrees. 107 feet greater depth to the 1,200 feet level would take us 161 feet farther west; I mean that a depth of 1,200 feet in the Maas mine should be about 161 feet farther southwest than the present level, 1,093 feet.

To clear up any misapprehension of my meaning: When discussing the conditions known to be favorable for the concentration of bodies of soft ore in the Marquette range, I stated soft ores preferred synclines, and avoided the anticlines, as a general rule. By synclines, I meant any geologic structure which for ore concentration would answer same purpose—in fact, impervious troughs of all kinds.

These may be formed, not only by the folding of the rocks into synclines, but by the intrusion of igneous rocks in the iron formation, so that the point of intersection of the intrusive with a layer in the iron formation, or below it, forms a trough. Similar troughs may be formed by the intrusion of igneous rocks in the irregular masses, and some ore bodies are known to occur on impervious basements of intruded igneous rocks as well as in synclines and impervious troughs formed in other ways.

1340 A drill hole within 250 feet of mile post 166 shows 21 feet of iron ore between depths of 600 and 660 feet. As we proceed west, the ore beds, if found, will be probably at greater depths, increasing, to the west, under the track; in the location of the Maas and Negaunee mines, the trough pitches west.

ALLEN.

Cross-examination.

By Mr. Eldredge:

The two sheets of Defts.' Ex. 73 are separated by a stretch of country—that portion of which I have made no map, about a mile west of the Ishpeming city limits (mile post 172½) to a point two miles east of Clarksburg (mile post 178).

The Negaunee formation and the Negaunee and Maas mine formation are different things. The Negaunee formation is the name of the ore bearing formation of the entire Marquette range, with the exception of the unimportant Bijiki schist. The eastern limit of the Negaunee formation is encountered by D. S. S. & A. at mile post 165.

The iron ore formation in which exploring has been done in Marquette city is a lean siliceous formation of Kewatin age, considered by geologists as unworthy of serious attention as an ore bearing prospect. It is called iron formation in geological literature, as it probably originated by action of the same agents as were instrumental in formation of the richer iron bearing rocks. Similar rocks, containing by analysis not over 3% to 5% iron, or less than the average basic green stone, are likewise called iron formation, though they consist mainly of pure silica.

1341 Marquette city is, according to my knowledge, what is known as a lean, banded, siliceous, metamorphosed jasper. In this kind of rock, the iron is in large part concentrated in thin bands alternating with those of a more purely siliceous character, so that no part of this formation could be mined with profit, or find a sale as iron ore.

The difference in the jasper at Ishpeming and at the Jackson mine at Negaunee, from that described, lies in the much higher degree of metamorphism of the Marquette formation and its lower content of iron; there is a difference in the ages of the two formations, the one at Marquette being the Kewatin age and very much older than the Negaunee ore bearing formation of the Marquette range. In the rock called jasper, as applied to the iron bearing

formation of the Lake Superior region, the iron may or may not be concentrated into bands of iron ore alternating with other bands composed nominally of silica, but the whole rock may contain iron in disseminated form, while nevertheless expressing a tendency for the concentration of the iron in higher degree in some bands than in others. That is as near as I can get to the definition.

In the metamorphism of rocks, there are two principal kinds of changes, one known as katamorphism and another anamorphism. Assuming the formation at Marquette is an iron formation, it does not extend to and meet the Negaunee formation. It does not extend west to the Negaunee formation, as there can be no strategraphic connection and no real connection between rock of Kewatin age and rock of vastly under age, as the Negaunee formation, unless they are brought together by a fault, which in this case is not known to exist; if they were brought together by a fault, they would still be separate and distinct formations.

1342 There are a considerable number of drill holes put down, and considerable exploration, not reported to the Tax Commission. The Negaunee formation extends farther east than shown on Defts.' Ex. 73, but not near the railroad. I left off of may map all ore bodies over a half mile from the railway.

Concentration usually takes place in troughs bottomed by slate, but it may take place elsewhere. In any iron ore formation, such as the Negaunee formation, a merchantable body *or* iron ore could exist, unless the contrary is proved by prior explorations.

The main workings of Maas and Negaunee mines are on the same ore body. They are not a part of the same ore body as the Queen or Regent group, or as the Athens, Lucky Star or Prince of Wales mines.

Considering the extent of the ore formations in corporate limits of Negaunee, I would say that the ore formation had not been fully explored. That territory affords one of the most promising fields for exploration for the discovery of iron ore in Michigan, Minnesota, or Wisconsin.

The two holes I referred to on section 1 are located on Defts.' Ex. 73, Allen; one is almost north of the D. S. S. & A. station, about 800 or 900 feet, and the other, say, 300 feet north and 1,200 feet west. In the one north of the station, they encountered 105 feet of ore below 2,100 feet. In the second hole, they encountered 206 feet of ore below 2,784 feet; the hole stopped in ore. These holes were not revolutionary in the ideas they gave to geologists. I would say they were of importance to mining men, as tending to confirm the ore possibilities in the Negaunee formation.

1343 In broad outline, they were put directly through the hard ore formation, and at great depth struck the soft ore formation. It is a very reasonable inference that they confirm the idea that large portions of Negaunee are probably underlaid with merchantable iron ore. The results of drilling in Negaunee have shown that the soft ore measures in the lower part of the Negaunee formation are rich in ore, in many places deeply buried; great depth is not essential to occurrence of ore in this horizon. As you go west

in this iron ore formation, the ore bodies, if they exist, would be discovered at still greater depth; i. e., that part of the formation more nearly in the center or trough of the fold.

There was no evidence of the character of Negaunee formation at great depth west of these two holes, until they were put down. By folding or in some other way this ore body may be found west not to be so deep and to have changed, to some extent, its direction. Westerly from these holes, the ore will probably be at greater depth, if the formation continues as indicated by those holes, because the entire Marquette range is a great westward pitching syncline, of which the Maas-Negaunee syncline is a minor but component part; the whole thing pitches west.

Without assuming an extension of the Maas-Negaunee ore body in a continuous sheet to the deep holes in question, I would state that the ore in these holes is very much more probable at the same horizon as the Maas-Negaunee ore, and in the same syncline of fold. It is not necessarily a continuation of the Maas-Negaunee ore body, though the ore occurs at the same horizon. By horizon, I mean the ore occupies the same relative position in the Negaunee ore bearing formation, relative to the top and bottom thereof. I do not admit
that there is a continuous sheet of ore from those holes to the
1344 Maas-Negaunee mine. I think it is quite reasonable, and even probable, that that ore is at the same horizon as the ore in the Maas-Negaunee mines. I should consider it a discovery of a new body of ore.

I know the properties on the hill south of the D. S. S. & A. in Negaunee—the Milwaukee, Davis and Lucy. I think the statement fairly within reason that these deep holes justified putting down deep holes all along that ridge, with a fair prospect of discovering bodies of ore. There is an indication that the Lucky Star, Athens trunk extends into the Lucy mining property, as shown on Defts.' Ex. 73, Allen.

I spoke of the probable existence of an ore body of 250 feet depth. The D. S. S. & A. does not cross the ore body, as known, but it is possible that the ore body extends farther southeast beneath the track. It is about a mile west of the New York mine.

I would not go so far as to say that the occurrence of similar ore to that in these two deep holes on section one indicates ore below the Cleveland Cliffs and New York mines as a probability, but admit that it is a distinct possibility. It would be within reason to seek ore at lower levels than worked under the East New York mine and under the Cleveland Cliffs mine; the risk would not be so great as before.

The Negaunee formation extends to a very considerable distance beyond Lake Michigamme on the north limb of the Marquette fold, and on the south limb it extends to beyond the Republic trough; I count the Republic and Champion mines as a part of the Negaunee formation.

If Professor Smythe said D. S. S. & A. generally is on the Negaunee formation as far west as Kenton, that statement is not true in
the strict sense. If Prof. Smythe made that statement, he

1345 undoubtedly meant that for a large part of this distance the track is underlain by the Negaunee formation at enormous depth, but intervening between the track and the Negaunee formation in depth are several thousand feet of other rocks that are above and overlie the Negaunee formation. The Negaunee formation extends beyond Michigamme eight to ten miles and probably further. It is not as well known to geologists as that portion east; there has been no exploration. I judge ore formations by exploration; they may be traced magnetically.

Professor Smythe's statement, as I understood you, was to the effect that in his opinion the D. S. S. & A. was underlain by the Negaunee formation as far as Kenton. Except by inference from geologic structure, assuming the railroad to lie over the formation, Prof. Smythe could know nothing about it if it was at the enormous depth suggested. To qualify all the statements in reference to quotations from Prof. Smythe, it is my opinion he has been incorrectly quoted, or, if not, I misunderstood the matter as put to me.

The principles of geologic science are just as firmly established and just as dependable as those of other sciences. The business of mining, as conducted at present, is based to a very large extent on geologic science; particularly is this true in exploration for iron ore. The greater a man's knowledge of geology, the more intelligently he can advise as to the most likely places to explore; in the average case, he has no certainty that, when he has picked out the most likely place, ore will follow his exploration. There is no general certainty in geological work, when it comes to the actual finding of ore. All of the geologic science that we know now, or may ever expect
1346 to learn or acquire, will never eliminate the element of chance or luck in the mining business.

I am not familiar with the old workings of the Lake Superior Iron Co., at Ishpeming; I am familiar with the system. The custom was to preserve their shafts, and support the ground by leaving pillars. There is an enormous tonnage of ore in the pillars still in the Lake Superior hard ore mine. If it is the object of the company to save the ore, rather than support the surface, they can take the ore out; that is the common practice. Unless the surface is more valuable than the ore, it would be economy to take the ore out. In soft ore mining, filling a void, instead of allowing the ground to come down naturally, adds to the expense. I don't think any mining company would want a main line railroad track, that they had to maintain, to cross one of their ore bodies if they knew they would want to mine under it.

ALLEN.

Redirect examination.

By Mr. Wykes:

When I stated the most easterly limits of the Negaunee formation would be approximately one mile east of mile post 165, I meant that that point was the most easterly point I have shown on Defts.' Ex. 73,

Allen, but, as explained, this is not a complete map of the Negaunee formation.

There are no active mines along the south line, east of Eagle Mills. In the stretch of five to seven miles between the two maps (Defts.' Ex. 73, Allen), the probability of ore is so remote as to add no value to the land under and adjacent to the track.

Ore bodies are of variable thicknesses. The fact that drill hole over a hundred feet in depth stopped in ore is no indication
1347 that the entire ore body surrounding that hole would be of the same thickness. In geology we never assume a distance of over 50 feet around a drill hole. It is fair to say that the conditions in a circle of 50 feet radius would be represented by what you find in a drill hole in the center; beyond that, experience has taught us to make no assumptions, because the uncertainty of the conditions are such that we cannot speculate further than 50 feet on the results of a drill hole in iron ore. There are exceptions to that rule; there are certain areas where it is safe to allow a little bit more than that; there are areas where it is not safe even to assume a distance of 50 feet; sometimes you cut it to 25.

The probabilities are that ore, if found under the New York and Cleveland Cliffs mines, west of the two drillings near the station, meaning the soft ore at the base of the Negaunee formation, would be as deep as that shown by the holes in section one. The information we have leads to that inference, but in this the inference that ore will be found is not very trustworthy; that is at a lower point in the pitch that begins up at the Maas and Negaunee mines and extends westward. If it were in the same pitch, and if the pitch remained the same as indicated in the drillings in Negaunee city, the soft ore bearing horizon would be at depths almost, if not quite, beyond the reach of the drill.

I stated the dip changed and took a more horizontal turn, and it is not probable that the base of the Negaunee formation in these localities which we are considering is beyond the reach of the drill; i. e., I do not think that this rate of pitch continues for that distance, as we have evidence that it has already flattened out, but no trust is to be placed in any such reasoning, as a practical matter, because the elements in the problem are so elusive that there is no way of
1348 getting hold of them; we cannot make any definite calculations, and, if you did make an arithmetical calculation of that pitch, it would have no value from the standpoint of prospect.

The elements in the problem which make the presence of ore in places unexplored, and places 50 feet around from present drill holes or workings indefinite, have something to do with the fact that I did not add a value for assessment purposes to the lands which had not been explored and which were the distance stated from explorations. As a fact, the mineral values on properties to which we now refer, namely, the New York and the East New York, were placed at $12.50 an acre. They have no working mines on them; ore had been mined there in past years. All through the Negaunee basin, I followed the same rule, and included nothing for ore where I did not know of the presence of ore, or where I could not reasonably determine its exist-

ence. That was due to the uncertainty of finding ore or of knowing its quantity or extent, except where I had some previous exploration, or knowledge from exploration or workings. In other words, the values in property of that kind are purely speculative, and, while those speculative values may be sold, and there is a market for them, there is no way of ascertaining that market; the properties have no known intrinsic value, from an ore bearing standpoint, until ore is actually found. When we consider that probably not over five per cent of the entire area of iron formation would ever be proven to be underlain by iron ore, that course of reason is amply justified, because, if we assessed all of these properties which are not known to contain ore at high figures, it would result that we were taxing 95 acres out of a hundred at much above their value, though the other five per cent might be so valuable as to overwhelm these low valuations.

1349 I do not mean to alter in any particular my statement that excavations of ore in reasonable and ordinary quantities found in this district at distances below the surface of 1,200 feet or over would not disturb the surface materially, and whatever subsidence there was would be so gradual that it could be taken care of by filling from the surface.

1350 On July 14, 1914.

CHARLES A. LINDSAY, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I am 49 years of age, and live at Albany, New York. I am Division Engineer of the Mohawk Division of the N. Y. C. & H. R. R. R. Co. I was educated at the University of Pennsylvania, graduated as A. B. in 1884, and took a post graduate course in 1885, which gave me the degree of Civil Engineer.

After leaving college, I worked about four months with Underwriter's Association, Philadelphia, as a surveyor of fire risks, and then went to the Union Pacific in Nebraska in 1885, on preliminary surveys, location and construction. In July, 1886, I was on the construction of a 25 mile double track railroad, near Cincinnati, for Pennsylvania lines, and stayed there two years. I was then transferred to Pittsburgh, on the location of a branch railroad to coal lines in the Pittsburgh district; shortly after, was transferred to the Maintenance of Way Department of the Pittsburgh, Ft. Wayne & Chicago Railway, at Ft. Wayne, in charge of the engineering in maintenance of way on the Pittsburgh, Ft. Wayne & Chicago Railway, west of Crestline, including Chicago terminal. I was there until the spring of 1890, when transferred to Cincinnati, as Division Engineer of the Cincinnati Division of the Panhandle lines of Pennsylvania, from Cincinnati to Columbus, with branches from Xenia and intermediate points east of Springfield, Ohio, and west to Richmond, Indiana.

I stayed there until 1898, when I took service with the Southern

Railway, being Division Engineer on its Washington Division, to Lynchburg, with a fifty mile branch from Alexandria west
1351 into the Blue Ridge Mountains, and a 120 mile branch from Manassas, Va., to the Blue Ridge Mountains, through the Front Royal Gap. I stayed there until 1901, when I took service with the Pennsylvania Division of the New York Central lines, located at Jersey Shore, Pennsylvania. This division consisted of the Fallbrook Railroad, from Jersey Shore and Williamsport north to the connection with the main lines at Lyons and Geneva, and west into the coal regions of Pennsylvania. The Beech Creek Railroad has many branches in the coal regions, and while there I laid the track and ballasted it, and finished it, ready for service, on 28 miles from Clearfield east, down the Susquehanna River Valley, to Keating, on the Pennsylvania, over which our company acquired traffic rights to Jersey Shore, so between the Jersey Shore and coal regions we had a low grade line favoring the heavy coal traffic, reserving the Beech Creek line for the return of the empty cars on heavy grades.

I was transferred from the Pennsylvania Division of the New York Central to the Mohawk, in 1902; was there until 1907, when I was transferred to the electric zone of the New York Central, 57th St. north, for a year and a half, and then returned to the Mohawk Division at Albany; have been there since.

While in charge of the Mohawk Division, up until March, 1910, I had a charge of single track railroad from Herkimer, New York, north, through the Adirondacks, to the Canadian Pacific, south of Montreal, over which we had traffic arrangements into Montreal.

I have been in actual charge of maintenance since 1890; that began on the Panhandle system of the Pennsylvania. In all my subsequent experience, I have been in actual executive charge of maintenance of way.

1352 I have given special study to railway operation, its effect on track, roadbed and track structure, bridges, trestles, and other structures, the cost of operation, and the amount and causes of expenses incurred in the different kinds of business conducted by railways.

I examined complainant's railway, arriving on its line July 10, 1914, and spending several days going over the line; the purpose of examination was to study the physical characteristics and condition of the property, and its operating and traffic condition, so far as such rapid examination would permit.

I noted the passenger train speed, Houghton to Marquette, it being slightly over 40 miles per hour between stations, and at times obtained a speed of 52 miles per hour. I studied the train schedules from the official employees' time table.

I had never been in this region before; I confirmed my previous impression that the ore industry was concentrated in a very small area. I noted the arrangements with other railroads, by which their trains were operated over the tracks of this company; I observed the traffic conditions, and that there was a denser traffic on certain portions of the line than on others. I figured the railroad might be divided into 5 zones, on which the traffic density varied greatly.

These zones, in the order of relative importance as to traffic density were: (1) Winthrop Jct. to South Marquette, (2) Winthrop Jct. to Nestoria, (3) Nestoria to Houghton, (4) South Marquette to Eastern terminal, and (5) Nestoria to west state line.

I asked and obtained the number of passenger and freight trains passing typical stations in each zone on a typical day in each month of a given year; from a study of the figures, I confirmed my
1353 opinion that I have selected the zones properly, and that the conditions I have described are those that existed.

I asked and received information as to the character of the tonnage, and was furnished a copy of the annual report of the South Shore to stockholders for fiscal year June 30, 1912. In this report I found, on page 11, a statement of commodities handled for years ending June 30, 1912, and June 30, 1911, in tons and per cents of total tonnage; this gave, ore 42.8% in 1912 and 41.42% in 1911, and lumber and other forest products 24.22% in 1912 and 23.82% in 1911.

The South Shore lines, with respect to physical characteristics, can be divided into two parts, that west of Marquette being very crooked, with severe gradients, that east of Marquette, being comparatively straight, with relatively easier gradients.

The railroad, Nestoria west, was laid with light rail, and the alignment and grade conditions were quite severe. Track conditions on that part were not as good as on any other part of the line. The line, Nestoria to Houghton, involves very crooked alignment, and some of the heaviest of grades. Nestoria to Marquette, the grade and curve conditions are not quite so severe as Nestoria to Houghton. The track, Houghton to Marquette, is well constructed and maintained; Marquette to eastern terminal, it is in good condition, well constructed and maintained, and of the highest degree of excellence of any track in the territory, and on it train operation could be maintained at the highest speed. The bridges, trestles and culverts, so far as I could observe, were maintained in a high degree of excellence.

The locomotives are not of excessive weight for the track conditions and speed made, and the passenger equipment is of a higher degree of excellence than would be found on most roads similarly situated, and in fact better than the equipment of other lines
1354 into this territory; the freight equipment, I judge, is in keeping with the lines of other railroads. In passing over the road, I had with me Complt.'s Ex. 2, Riggs, and followed the alignment, grade, rail and ballast conditions.

From observation of traffic conditions and study of time tables, I realized that with mixed freight and passenger traffic it would be necessary to superelevate the curves. I observed the principal curves and the superelevation, though I made no measurements except by the eye. I feel I am thoroughly competent to estimate from the action of trains passing over the curve. I found the elevations uniform around the various curves, the degrees of which I noted on Complt.'s Ex. 2, Riggs, and found them sufficient for the speed of the train I was riding on, and not too high for lesser speeds. I saw

no curve with 8 inch elevation, and I believe, had there been such, I would have seen it.

I observed the passenger trains and service, and studied their schedules, and was impressed with the fact that, for a road passing through a territory as sparsely settled, the extent, amount and general character of the passenger service was much above that which the country would support or warrant. I do not think it better than it ought to be; it might be improved in certain instances.

The only refinements of track and track maintenance, for any particular traffic, that I noticed was that I felt the curves were maintained to a higher degree of excellence, generally speaking, than the tangents; this condition was evident to me to be a tribute to the comfort, convenience and safety of the passenger traffic.

As to whether the road was maintained in a way necessary for comfort of passengers, but not necessary for freight service, I believe

1355 the distribution of ballast, generally speaking, was greater particularly east of Marquette, where swamp conditions exist; that was due to the fact that the high speed of passenger service necessitated better and more copious ballasting, for safety, comfort and convenience. There is nothing peculiar about this line in respect to the bridges, in that bridges must be designed, constructed and maintained for the highest class and fastest trains to be operated over them.

Limiting my answer to ballast, ties, rails, other track material, roadway and track, bridges, trestles and culverts, undergrade crossings, and grade crossings, the track must be maintained for the faster passenger trains; there is always provided a margin of safety meaning that, if designed for a speed of 50 miles, a train running 60 miles an hour would still be safe. The destructive elements of traffic on track, in the order of importance, in my opinion, are speed, excess strain due to locomotive, and the weight of equipment and loading behind locomotive.

The effect of speed on track follows the fundamental law of physics; i. e., that the blow resulting from a moving object varies with the mass, directly, and with the square of the speed.

The locomotive constitutes a very heavy mass on a short stretch of track—a concentrated loading. The axle loads of locomotives are usually much greater than those of cars. The springs must be more rigid than those of passenger cars. In consequence, the action of the locomotive on track is of the entire mass acting as a unit, and not of the individual wheels, as with a car.

Weight of equipment and loading has its effect, though I am not sure it follows the law of physics, so far as it affects track maintenance, in the direct ratio I have mentioned, as, if we assume the tonnage in zone 1 to be five times that of the line east of Marquette,

1356 we might assume the maintenance expense in zone 1 to be five times that where the traffic was less dense, but from my observation and experience I do not believe that that ratio will follow; therefore, the expense of maintenance does not follow the direct ratio in increase of tonnage, but a less ratio. This would have to be determined by segregating the tonnage expenses of each

zone and comparing each zone separately, which would require bookkeeping. I am not able to form a judgment regarding that.

I would estimate the tonnage in zone 1 to be five times that of the zone to the east, and if the expenses in zone 1 were more than twice those of the other zone, I would be much surprised. On inquiry, I was advised that there was about twice the labor and one-third more consumption of ties in zone 1, but that the other expenses did not vary materially from those east of Marquette.

If my method of apportioning expenses of maintenance be correct, it would be necessary to ascertain the total tonnage of passenger service and multiply it by the square of its maximum average speed, and take the tonnage of the freight service and multiply it by the square of its average maximum speed, and from that obtain a ratio. That ratio would disclose that passenger service causes the greatest expense for maintenance, both in destructive wear and on account of higher standard of maintenance for the comfort and convenience of passengers.

Assuming 522,000,000 freight ton miles and freight speeds of 20 miles per hour, and 212,000,000 passenger ton miles and passenger speeds of 40 miles per hour, speed assumptions being based on the time table rule, the ratio becomes 37.4% freight and 62.6% passenger, by applying the formula M. V. squared.

There is a difference in the condition of equipment of the two classes of service, the freight being the more difficult to move in a given way. I think a proper and fair allowance for that element would reduce the ratio to 40% freight and 60% passenger.

1357 In my judgment, taking into consideration only the expenses of maintenance of way and structures named, the passenger traffic and the passenger revenue train mile- are more expensive to produce than the revenue freight train mile.

In zone 1, there is a density of both freight and passenger traffic, closely approximating equality, while on the balance of the line the density of passenger traffic is equal to, if not greater than, the freight density, and moves at speeds of greater excess than the speed of the freight traffic. As a consequence, the burden of maintenance of the long stretches of lean territory, for the safety, comfort, and convenience of the passenger traffic, and the formula just given, distributes the tonnage over the entire line. Eliminating the tonnage and expenses of zone 1, and considering the conditions of zone 4, east of Marquette, I think the facts would prove the ratio to be 70% passenger and 30% freight.

In the operation of freight and passenger trains, there are other elements entering into the discussion which in an accurate analysis should be given due consideration, but, relatively speaking, these are of minor importance—in many cases almost trivial as compared with the elements of speed, mass of locomotive and weight of load behind it. Zone 5, Nestoria west, is the lightest line, and, because of worse physical characteristics of country and track, and the traffic conditions, the ratio would be between 60-40 and 70-30.

In arriving at ratio of 60-40, I have allowed 2% or 2.5% on account of the inferiority of freight, as compared with passenger, equipment. I intended to include both wear and weather causes of maintenance of way expenses on those particular items.

Taking into consideration other items of expense that might increase the cost of maintenance, such as trackage used ex-
1358 clusively for one service or the other, the ratio that I would apply to the entire road, excluding allocatable tracks, would be less than 60% passenger and more than 40% freight. An equal division of the expenses between the two classes of service would, I think, make ample allowance on a most conservative basis for the relative cost of the two classes of traffic. In zone 1, the ratio would undoubtedly be reversed, though not directly proportional. On the whole road, without studying each zone separately, I would take 50-50 as a conservative and fair method of estimating the division of expense. I should say that the gross ton mile ratio, as used by Thompson, was not proper for assigning the expenses due to the destructive effect of the traffic, as he gives no value whatever to the element of speed, which is of primary and greatest importance.

In my experience, the maintenance expense of plaintiff's railroad would be considerably less if there were no passenger traffic. It would not have to be kept in as good condition if it had nothing but freight; the difference, roughly, would be 20% to 25% less.

Referring to Thompson's testimony, that the greater wear on rail on curves on South Shore is to be found on the outer rail, and that the wear on that rail is about 20% above than on tangent, and that the wear on inner rail is about 5% above the wear on tangent, in the brief time of my examination, I could not go into such details, and I am unable to state the facts on this railroad. In my experience, the high rail on a curve wears out faster than rail on tangents, and faster than the low rail. I do not believe Mr. Thompson's figures would express the right proportion on any conditions that I have ever seen. Generally, we re-lay the low, as often as the high, rail, though sometimes we allow the low rail to stay in a little longer.

With regard to the testimony of Thompson, to the effect that the following elements cause expenses in freight operation in
1359 addition to the differences in weight.

(*a*) That the car wheels in the freight service are not run with their axles as nearly parallel as the car wheels in the passenger service: I have seen no instances of that kind sufficient to make any material difference in the problem.

(*b*) That freight trucks are inferrior to passenger trucks: I would not concede this, except as they might be maintained in a less perfect state than the passenger trucks. The design of freight car trucks is more rigid and more substantial in many respects, size for size, than passenger car trucks. The springs on a passenger car truck are more numerous, and the passenger truck is of a heavier and better construction. The element of comfort not being necessary in the freight car truck, it is designed to give sufficient elasticity, so that the flow of the rolling load upon the track may be minimized.

(*c*) That freight car wheels are chilled iron instead of steel tired, is true, though the material used is not of itself a detriment.

(*d*) That freight car wheels are eccentric, and not true circles, like passenger car wheels: In my opinion, there are as many eccentric passenger car wheels as freight car wheels, and as many eccentric locomotive tires on passenger as on freight locomotives, and the influence of an eccentric wheel on high speed is greater than at low

speed. This element would not be material on freight equipment, but would be material on passenger equipment, and necessitate the turning of tires more frequently to avoid accident.

(*e*) That irregular freight car wheels are more apt to freeze in the brakes or slide on the tracks: Not being able to concede a great amount of irregular freight car wheels, I cannot agree with the balance of the conclusion.

1360 (*f*) That the springs under freight cars are primitive, and inferior to those in passenger cars: While the average age of freight cars might be greater, with more freight cars of the lower type, I would not consider that this was of any great moment, or would introduce any considerable factor.

(*g*) That freight trucks do not turn as readily on their centers as passenger trucks, and do not have roller side bearings, like passenger cars: It is true that the freight trucks do not turn as readily as the passenger trucks, because of the greater concentrated loads. The roller side bearing is comparatively recent, and has been applied to a large number of freight cars; there are as many freight cars in the country with roller side bearings as passenger cars. Ordinarily, the load is supposed to rest but lightly on the side bearings, and the element of resistance to curving, and consequent element of additional wear to track, seems to me to be too remote to be able to give an appreciable value of itself, though I admit that it does have substantial bearing in the general study of the problem, and that the irregularity of freight car wheels is an appreciable item of cost. The general condition of freight car wheels is less perfect than of passenger car wheels, but it does not introduce a tangible element of cost; the gross value of all these irregularities is of minor importance as compared to the elements of speed, weight, and engine effect.

Thompson's Ratio 1, of gross ton miles, is not, in my opinion, proper for division of wear cost, because it gives value only to the question of weight; it gives no value to the speed, which is of primary importance, or to the element introduced by the locomotive. In my formula, producing a ratio of 60-40, I took the ton mileage as given

1361 me, and did not give value to the locomotive; had I done so, the passenger figures would have been higher, and the freight lower.

The only difference in the excess strain of a locomotive between the freight and passenger is that affected by the difference in weight, length of wheel base, number of axles, load per axle, and the general condition of wear, and to some extent by the action of the locomotive working hard. The stress would be nearly the same in each class of service.

In my opinion, weather stress is the most destructive agent of ballast, generally, though I cannot state as to South Shore. The next is the work in tamping, surfacing and lining track, mostly necessitated by the passenger service. The joints, due to the elements and the passage of trains, become low; the ordinary low joint is unobjectionable in freight service, but very objectionable in high speed passenger service, and a large part of the labor in maintaining tracks is to line and surface them to keep proper condition for the comfort and convenience of the passengers.

The ballast also is destroyed by disintegration, due to the absorption of moisture, or by frost—the action of frost. The St. Ignace ballast is limestone, which depreciates. I broke open two or three of those stones, just out of curiosity, to see whether that was rounded pebbles of that same formation, and I am of the opinion that it is, and it is a very soft limestone, most of the pebbles of the St. Ignace gravel, and will depreciate by exposure and by erosion and so on, and by crushing under the action of tools in working on it.

It is not proper to divide maintenance cost of ballast on gross ton mile basis because a perceptibly larger amount of work is done on account of the high speed passenger trains, and by frequent renewals to keep the track in condition for high speed trains. I should
1362 say it would be proper to divide ballast expenses 60% passenger and 40% freight.

While I cannot speak with accuracy, because I have not the statistics or facts, from my observation the road uses a large percentage of tamarack and hemlock ties and a small percentage of cedar; cedar ties are destroyed by mechanical wear, while over 85% of hemlock fail and are renewed because of decay. It is my practice to renew the ties more frequently when there are passenger trains, as a tie in freight track can safely be left much longer than if the track is used by passenger trains. The extra length of time depends entirely upon the passenger traffic, conditions and speed. If the speed of the passenger were very much higher than that of the freight train, we would take the ties out sooner, and throw away some of the useful life; in my judgment, the gross ton mile ratio is not proper to divide expenses of repairs or renewals of ties, because mere weight does not destroy the tie. I would divide on the basis of 60% passenger and 40% freight, except that in zone 1 it might be necessary to transpose the ratio. (Witness produced table showing movement of trains in the several zones.) Typical stations were selected to give a fair measure of the train density by zones. The table is as follows:

(Here follows tabular statement marked page 1363.)

raffic density, No. 1 being densest.

1364 I do not concede the propriety of dividing rails and other track material on Thompson's gross ton mile ratio. Rail renewals are necessitated by wear, distortion and inadequacy; rails are renewed principally on account of the high speed traffic. That ratio is not proper to be applied to the division of the common expenses for ballast, ties, rails and other track material.

As it would be unsafe to operate passenger trains at their normal speeds without the expenditure of money, money must be expended as much for one passenger as for a thousand. When I speak of the difference, I have in mind the safety, comfort and convenience of the passengers.

In my judgment, Thompson's time ratio, 4, is not a proper ratio for the division of the items of expense for maintenance of way and structures due to depreciation, weather stress, decay or erosion, as the expense should be divided in the inverse ration of the time occupied, because of the greater importance of the safety and regularity of the passenger service. The cost should follow the service, and cost of maintenance is due to speed.

Thompson's time ratio is not proper or accurate to divide common expenses as to care of roadbed, general cleaning, patrolling and watching, bank protection, filling and other expenses, for the reasons just stated, and the patrolling and watching, bank protection, and expenses of that kind, are primarily incident to the passenger service.

Thompson's time ratio does not properly, or with approximate accuracy, divide the common expenses as to the removal of snow, sand and ice, the maintenance of bridges, trestles, culverts, grade crossings, fences, signals, interlocking plants, snow and sand fences and snow sheds, telephone and telegraph lines, etc.

1365 I do not consider either the gross ton mile or time or revenue train mile ratio as an entirely theoretically proper one, but, based on my calculations, the revenue train mile is the one that gives the more accurate result, because of the manner in which the speed and the importance of the passenger service and the engine element are ignored in the Thompson method.

In my opinion, neither the gross ton mile ratio or the time ratio of Thompson would properly divide the unallocatable property used in common by freight and passenger traffic. The reasons given as to division of operating expenses on these bases apply equally here. To divide the common property on the same basis on which common expenses are divided, as indicating use, would be a fairer measure than either of the two methods outlined by Thompson.

The side motion of a freight train at slow speed causes a strain on track when the engine is laboring hard. As compared to the gross effect from all causes of either class of service, it is trivial, because, when the engine is working in such manner, the cars are doing their least damage, as they are moving at slow speed, probably up grade, and hanging away from the engine; they are not doing the damage to track that they would if the whole train were moving as a unit. Passenger engines also work hard going up grades, and do more damage when doing so than a freight train; the damage is

more nearly proportional to the square of the speed, and the equipment behind a passenger engine always acts as a unit, as it is close-coupled, and there is not the slack that there is in a freight train. The blow of a locomotive has everywhere much greater destructive effect due to the greater mass.

Referring to Thompson's alphabetical list of 28 elements weighting the cost of freight service and making the revenue freight train mile cost more than the passenger train mile, while I concede that some of the items weight the freight side of the problem, I do not wish to admit that they make——

[Folio 1366 missing.—Printer.]

1367 consequential, and there are many offsetting instances, such as the carrying in freight trains of company material used in maintenance of common tracks.

(*k*) The hauling of business and private cars by passenger trains may weight the freight side, but must be infinitesimal.

(*l*) The sustaining, through passenger expenses, of the sleeping and dining car service is an integral part of the service, and a source of advertising, and must be considered a part of the passenger service; it does not weight the freight side.

(*m*) The exclusive use by freight traffic of large amounts of mileage of line, side tracks and spurs may weight the freight side. This mileage and its cost of maintenance is relatively small, and much can be allocated.

(*n*) The greater use of yards and terminals by freight traffic in switching does weight the freight side, if it is a fact; it would vary closely with the density of traffic.

(*o*) Double and triple tracking for the needs of freight service may weight the freight side, but will be due to traffic density. I saw, and believe there is, no such condition on this line.

(*p*) The use of main tracks by freight service in switching in greater proportion than in passenger service may weight the freight side, but will be trivial.

(*q*) The more frequent starting and stopping of freight trains in switching may weight the freight side, but is not a general fact, and would be infinites-mal.

(*r*) Switching by road locomotives, not represented by road train mileage or appearing in switching records for first hour, does weight the freight side, dependent on accounting methods; it must be trivial.

1368 (*u*) Greater length of passing track, to accomodate longer freight trains, does not weight the freight side; freight trains take sidetrack to avoid delay to passenger trains, and fact that track may also be used to pass freight trains ought not to give this feature undue weight.

(*v*, *w*, *x*) These do weight the freight side, but are trivial.

(*y*) The higher center of gravity of ore cars does not weight the freight side.

(*z*) Stational cost of freight movement, as freight cars are moved

superfluously in switching freight cars, may be added to the freight side, but, if so, is infinites-mal.

(*aa*) The greater damage to track and equipment by greater number of flat spots on freight car wheels does not weight the freight side.

(*bb*) Greater injury to tracks due to reciprocating motion of engine sideways, because of alternately applying the power, the element of injury varying with the tractive force of the engine, being greater at slow than at high speeds, I cannot concede always adds weight to the freight side; it may in cases, but when the freight engine is working hard, the car effect is reduced to the minimum, offsetting in some degree the other; the train behind it is not acting as a mass, but is pulling the cars, and the engine alone damages the track. In passenger at high speed the engine also works hard, and has greater effect than a low speed engine working hard. Generally speaking, the sideway motion of the slow speed freight engine is of slight importance in track damage, and ought not to be given much. weight. The engine works so in starting and in climbing heavy grades, and the action reduces rapidly as the speed increases, and the effect on track also reduces rapidly.

1369 The items which throughout this case are claimed to weight and add to the cost of the passenger train mile were listed for witness by counsel as follows:

(*a*) Higher speed of passenger trains, requiring track elevations on curves and other adjustments.

(*b*) Greater expense to insure comfort, safety and convenience of passengers.

(*c*) Removal of snow to keep the road open during storms.

(*d*) Preference given to passenger traffic, delaying freight trains and increasing expenses of their operation.

(*e*) That, of the unallocatable items of expense, 18.6% consist of transportation expense, of which 59% is items that have a direct relation to train movement, and a greater proportion being claimed to be incurred on account of moving passenger trains, because of the necessity of giving them the right of way, and

(*f*) That more superintendence is required by and given to passenger trains than freight, because of the greater risk and higher speed.

After the statement the witness was asked: "What are your views with reference to this statement?"

Generally, I would say that I know nothing of how these expenses are allocated, but all of these items which you have mentioned have a bearing on the subject. I think probably that would be sufficient. With the exception of the damage to the freight equipment, they are all of considerable importance.

The items which Thompson says weight the freight side of the problem are relatively trivial. The causes of depreciation are the destructive effect of traffic, decay, exposure to the elements, obsolescence and inadequacy.

1370 In answer to Thompson's statement, that the dynamic augment does not pass the elastic limit of the track structure until

speeds of 30 or 40 miles were reached, I do not understand entirely what he means, but the statement is unwarranted by either theory or experience; it gives the idea that the elastic limit is passed at speeds of over 30 or 40 miles per hour. Elastic limit is the point at which a body under stress begins to change its shape; having passed the elastic limit, it does not return to its original form, but has acquired a permanent set. If the stress continues further beyond the elastic limit, fracture results; if the stresses in track approach anywhere near the elastic limit, there is danger.

The statement of Woodlock, from Vol. I, page 427, Wis. Railroad Com. Report, Buell case, that the part of cost of maintenance depending on traffic should be divided between the different departments of the service on the basis of locomotive mileage, switching included, in that the locomotive mileage alone is responsible for at least one-half the wear and tear of track because of the elimination of the question of speed. At high speeds, the locomotive ratio would be higher than at low speeds; it would be as the square of the speed. I cannot conceive of any speed at which a freight locomotive alone should be charged with one-half of the cost of replacing the wear and tear of the track.

Mr. Woodlock states that the locomotive mileage alone is responsible for at least one-half of the wear and tear of track; that includes passenger as well as freight locomotive mileage. Assuming he means destructive action of the traffic by wear and tear, I would be more inclined to agree with him that his ratio is nearly right; he may include his wear and tear of replacement, no matter to what cause.

1371 LINDSAY.

Cross-examination.

By Mr. Wykes:

(Witness spent two days going over South Shore line, largely on moving trains.) I observed the character of the country, and of the track structure, the conditions of rails, ties, curves, ballast, rail joints, appurtenant property, curve elevations, traffic and business conditions, and the character and volume of freight and passenger business, and its density on different portions of the line. I asked no questions on the trip, and no information was volunteered, except in one or two minor instances.

I did not find when the ballast or rail was put on the different stretches, except where indicated on Complt.'s Ex. 2. I have nothing to indicate the condition of the property one, two or three years before my examination. I cannot say what was added to the property, or the relative condition of maintenance, in 1913, 1912 or 1911. My answers, as to condition of maintenance, all relate to the time of my inspection, and to no previous time. I have testified in no other rate case, and have never before made anything bearing on a division of costs or laid down principles therefore, except in abstract study of problems connected with general study of track maintenance.

I tried to get the underlying principles on which such allocation might be based. From the time I returned to Marquette to going on the stand, I was engaged in preparing answers to questions submitted to me, which were in general before me in typewriting, as I testified. I had made memoranda of points for answer, and testified from notes. I asked for, and was given, the revenue train mileage, but did not get it for ore service or for different divisions separately. The only information I got on that line was the sheet showing the number of trains passing selected points. I did not get the revenue
1372 train mileage by any subdivision of the road, or by the zones I fixed, and I got no traffic statistics in the passenger or freight service for any divisions, and did not become familiar with any. I saw probably ten D. S. S. & A. passenger trains at passing points on the road; it may have been that I saw the same train more than once. I made no detailed inspection of the locomotives, but saw some of the diagrams, and I inspected examples of those as I saw them passing over the road. I did not learn the relative wheel bases of locomotives in the different services, but studied the diagrams, and got a mental appreciation of the relation of the two classes of engines. I ascertained the ore tonnage was 42% of the total in a certain year, and did not ascertain the revenue train mileage of that business, but I got the impression that, due to short haul, it would be relatively smaller than if it moved over entire division. It might be 12% or 20%.

My method is applicable to zone 1, but I have no way of getting the statistics. The revenue train miles and the maintenance expenses of zone 1 cannot be obtained from the record.

My formula, generally speaking, is M. V. squared. It would not be proper to apply 40 miles per hour in zone 1, because the passenger trains cannot, and must not, run at that speed there. To study the zone as an entirety, you must take all existing conditions—tonnage, speed, traffic density, and everything affecting that zone. In zone 1, where the speed of the passenger and freight trains is more nearly equal, and the freight traffic density is much greater, the freight should bear a very much larger proportion of the expense of maintenance than the passenger, in my opinion. I would still apply my formula, after I found the proper speeds and weights, making
1373 allowance for engine effects. I add the locomotive in, and then add an increment to represent the destructive effect of the locomotive, acting as a mass.

In the five zones into which I divided the road, I made no comparison by percentage of relative density of traffic, but simply went to the point of deciding one was heavier than another, and fixed the order. The passenger business follows practically the same separation, as to traffic density, as the freight. Zone 1, Marquette to Winthrop Jct., is the heaviest, and zone 5, Nestoria to state line, is the lightest, for both passenger and freight traffic. I am judging by the number of trains by selected points. Zone 5, Nestoria west, is of lighter construction and through relatively irregular country, which would increase maintenance cost.

The average weights of rail per mile were, 1913: east of Marquette, 105 tons, Marquette to Houghton, 106 tons, and west of Nestoria, 96.6 tons. There was some re-ballasting going on during my trip, and evidences of general re-ballasting within last 5 years. It becomes necessary to re-ballast from time to time, which is a constant practice. You let a strip of, say, 20 miles go for, say, 5 years, and then ballast sufficient to take care of it another 5 years, and you do alternate stretches of the line every year. The depreciation of ballast is a depreciation of the railroad.

I did not measure or ascertain the degrees of curve elevation; I knew it was not excessive. I saw 5 degree curves and decided that they would not elevate as we (N. Y. C.) would elevate them for our high speeds. I watched practically all the curves; I would judge there was no elevation over 5 inches. An 8 inch elevation would be proper for 40 mile speeds on 8 degree curve. There is an 8 degree curve in Zone 1, but at a very low speed point, and it is almost flat—

1374 one or two inches elevation; that would meet the needs of both kinds of traffic, as the speeds of the two classes of trains in zone 1 were practically the same.

A freight train on that curve with no super-elevation would cause some wear greater than on tangent; it would be on flange side of outer and top of inner rail. That excess wear occurs from a train traveling at a speed to which the curve was adjusted. An excessive elevation of the outside rail for a slow speed would increase the wear on the low rail and decrease it on high rail. As the outer rail is elevated in height above the needs of the particular train, the wear on outer rail decreases and that on top of the low rail increases. The percentage of curved track on the road determines primarily whether the excess wear on curves due to super-elevation is insignificant. Speaking of the South Shore, I should say the item was appreciable, on two curves of same degree, one elevated 4, and another elevated 1 to 2, inches, and the movement over both being at slow speed, nobody can tell what the wear due to higher elevation is; I should say there would be at least 10% difference in wear due to that particular cause. The increased wear is on ties also.

In zone 1, tie renewals are more frequent than outside that zone, they being 30% heavier there. The labor expended on main track in zone 1, eliminating exclusive freight track and branches, would run about double that in similar stretches in adjacent zones; this confirms my belief that the density of freight traffic in this territory causes greater tie renewal due to rail wear and to slow freight train movement, rather than to passenger trains. I should expect the cost of track maintenance per mile in zone 1 to be 1½ times the average of the adjacent zones, not taking into account the industrial spurs in that area maintained by separate forces. This is based on investigation and information.

1375 Excluding zone 1, a fair average annual maintenance cost for the remainder of South Shore per main line mile, taking into consideration all tracks necessary in operation, would be $1,000; the annual average for zone 1 would be probably $1,200, counting the double track as separate lines. My 1½ times as much refers to track

maintenance. There are other expenses which would reduce the proportion to $1,000 and $1,200.

The most destructive element of mechanical wear is the train speed. As between the allowance which must be made for speed alone and that made for extra effect of locomotives, I am not prepared to say which is the greater; either one might be greater under certain conditions of speed. The effect of same locomotive would vary with speed; it might vary with different roadbed conditions. Before I could say that excess speed in passenger service, as expressed in the difference between 20 miles freight, and 40 miles passenger, per hour, would be sufficient to overcome the excess weight of freight, the effect would have to be calculated; but I believe that it would to the extent I have calculated by the application of my formula. That produced a ratio of 60% passenger and 40% freight; the difference is due to squaring the speed in each instance, and applying it to weight of entire train, including locomotive. This formula is the formula for impact. After applying the formula and finding the ratio of 60% passenger and 40% freight, I brought in other elements; my final judgment rested on a 50-50 basis. The modification was due to different traffic densities in the different zones, and numerous other comparatively minor, some trivial, and some appreciable, results and things that affect the problem; I want to be, and believe I am, as fair to the problem as it is possible to be, and that has permitted me to say that a 50-50 ratio is one limit and a 60-40 the other, and that the proper basis is between the two extremes.

The largest factor of reducing to a 50-50 basis was the conjestion of traffic in zone 1.

1376 Q. Why should you use that zone for the purpose of modifying your figures, when the traffic, that is, the tonnage and the mileage, in that zone enter- into the original computation of your 60-40?

A. In the absence of statistics that apply to each zone separately, and using statistics only that apply to the property as a whole, there is a possibility of grave error creeping in that might give a very unfair result, but the fact that the traffic in zone one is so dense relatively to the traffic on any of the other zones convinces me that the 60-40 ratio is a fair maximum ratio, so to speak, and the 50-50 ratio a fair minimum ratio. If we would exclude zone one from the calculation, I believe the ratio outside of zone one would run as high as 70 to 30, or even 75 to 25, by actual calculation, but we have zone one with us and must take it into consideration.

That 75-25 is without giving effect to extra locomotive loading. To add for the locomotive effect would cause the percentage outside zone 1 to go to some point between 75% and 80% passenger and 25% and 20% freight; this would be a subject of calculation.

I think the refinements of track due to passenger service are included in passenger side of my computation, though I would not attempt to give amount there included, and no one could tell without statistics. All computations should be based on the highest passenger speeds fixed by the rules, and not necessarily by actual speeds; the trains run below the speed as often as above, and the variation from

the established maximum is so slight as to be inappreciable. You would not be able to get closer results of actual wear by taking each train with its weights and speeds separately, because you must keep your track up for your low speed train as much as for your high speed train, where you may reasonably expect such trains to run; your bridge and track must be strong enough for your heaviest load.

1377 My modification from 60-40 to 50-50 includes the recognition of those elements of extra freight cost which I admit. I would not attempt to tell you the degree of importance I attach to any particular one of those by percentage, or in any way, with my present extent of study; the degree of importance that I would attach to all of them would be 2%. The rest of the modification would be due to all other causes; the margin is wide enough to cover a multitude of sins.

Even when we get done, we do not know where the precise figure falls, with the statistics and figures we have. If we had statistics for each zone, we could more closely approximate certainty, and if we had statistics for each mile of road, we could still more closely approximate certainty; in such problems, as you go from the general to the particular, you are reaching certainty. It is not dangerous to speculate on generalities when you have nothing better; this is the best that can be done. I don't know anyone that has attempted anything as near; without a doubt, it is nearer than the revenue train mile basis. I have never heard of this particular formula being applied by any one.

I applied my ratios, not only to mechanical wear costs or expenditures produced thereby, but also to those produced by causes having nothing to do with mechanical wear. This is on the theory that I know no better method; I believe that is the best method, and the tail should go with the hide. Ordinarily, I think the mechanical wear cost is the greater, taking the entire structure. I have never been able to fix any proportion of the percentage of total maintenance cost due to weather and to wear, and have never put it into figures for particular items; other engineers have done so, but have varied greatly. I have noticed that one man says ties should be 90% wear and 10% weather, and another might reverse it. On South Shore, if we double the speeds of all the trains, the weather costs might increase very slightly.

1378 The increased speed might, for instance, "pump" the ballast, but, so far as a fence or building is concerned, the weather effect would go in the same ratio, whether the speeds were 10 or 90 miles an hour, or the tonnage large or small.

I do not apply the same formula to weather and mechanical wear costs as a theoretically correct proposition, but think it fair in this case. Applying the average train speeds, of passenger 27 and freight 16, to the ton miles, would produce ratios of 53.7% passenger and 46.3% freight; increasing the passenger speeds to 50 miles per hour, the results would be 91.03% passenger and 8.97% freight. That speed would materially change my opinion as to the application of this formula to expense of replacing depreciation due to decay, but would not change it as to the proportions due to the destructive effect

of traffic. I am not satisfied that in all instances the weather cost and use of the track should follow the results of my formula.

I would not say the formula was incorrect because of the variation between 53-46 under average speeds of 27 and 16 miles, and 60-40 under average speeds of 40 and 20 miles. With speeds of 50 miles passenger and 10 miles freight, I would not apply the formula to weather costs, but would as to speeds of 20 miles freight and 40 miles passenger, and 16 miles freight and 27 miles passenger. It is difficult to determine the limits where you would cease to apply it, unless you have all the facts as to the condition of the property. There comes a point at which we must leave the formula and apply our judgment in the division of weather costs and in the division of the property. There is no connection at all between weather costs on the same basis as mechanical wear; it is a mere coincidence that I should use it in this case.

The property and weather costs should be divided in proportion to priority and proportion of their use, and you would apply a
1379 judgment in each case; it might be necessary to go into detail as to each particular item of the track structure; as we become particular, we become certain. The mechanical wear cost does not vary directly with the tonnage; it varies more nearly with the square of the speed, which would be the maximum condition—the theoretical perfect condition.

The track damage would not necessarily vary with the square of the speed, but the cost of maintaining the track for speeds of 90, as against speeds of 20, miles an hour would vary as the square of the speed. The average cost per mile of track, including sidings, equated 2 to 1 on the Mohawk Division of New York Central, including all maintenance expenses, varied from about $1,200 in 1908 to about $1,800 in 1913; those tracks are all maintained for speeds of 35 miles per hour; some for speeds of 60 miles per hour, and, upon this, speeds of 90 miles per hour are attained, and we have to make good the depreciation caused by the 90 mile speeds; when I say speed is maintained for 60 miles an hour, I have special reference to curves on which 90 miles are not attained. On tangent maintained for 60 miles, 70 or 80 miles is perfectly safe, and the limit beyond that point is the limit of the engine and cars.

On South Shore, the maintenance for 40 miles an hour would permit speeds to 63 miles, or possibly beyond. I have never made any investigation to compare effect of speeds of 10 miles with speeds of 20 miles per hour on track; the difference between those would be small. As between 20 miles and 40 miles, the difference in destructive effect would not be appreciable, but in the cost of keeping the track in proper condition for such speed, because of the elements of wear and exposure to the elements, it would be appreciable. The cost of maintenance to permit speeds of 20 miles an hour would be more than twice as much as for 10 mile speeds; applying the formula of
1380 M. V. squared as between speeds of 10 and 49 miles, it would cost 16 times as much for the latter. In applying formula for the speed, the increase from 10 to 20 miles multiplies your track expense attributable to that particular speed by 4; if the speed goes to 40

miles, it multiplies by 16, if the speed goes to 60, it multiplies by 36, and if to 90, it multiplies by 81, assuming the same tonnage for each train.

If South Shore were maintained for freight traffic alone, the maintenance expense would be 20% to 25% less. That is purely a question of judgment, upon which I have made no figures; it is in the nature of a guess. That would be the average in all items of the track structure. Track labor and tie and rail expenses would be less if we dispensed with the passenger traffic. I have never made any test to determine what the difference would be in expense for ballast if there were no passenger service, and know of no one who ever did, though I think there would be an appreciable difference on South Shore.

In saying what would be a fair amount to spend per year for South Shore ballast, assuming conditions to be as they are, you must take into consideration that the South Shore has evidently been neglected in years gone by, and that some of the present day expenditures may be due to that fact. Assuming the South Shore was in average good condition at all points, I would say an annual expenditure of $25,000 per year for ballast would be about right.

If it were indicated to me, before I said that the road was ballasted beyond the needs of the freight service, that in 1910, 1911 and 1912 the expenditures for ballast, according to I. C. C. classification, were under $7,000 a year (which is the fact), I would give more study to my answer, and would probably reduce my figure, as it was a very hasty estimate, from my own standpoint, where we maintain a very high standard of excellence of track, much higher than South
1381 Shore, and I might not be able to get down to a sufficiently close approximation of their absolute annual needs of ballast; I might be doing them a grave injustice by saying that they ought to spend $25,000 a year for ballast.

If they spent $7,000 each year for 3 years previously, and in 1913 spent $25,000, I would say that they were either discounting the future or paying for their past debts. In my estimate of $25,000, I would include putting in the ballast, but I am satisfied that that would be a very high average annual renewal of ballast on the South Shore. If this were a slow freight line, without passenger traffic, cinder ballast would be ample for the surface, but they are now putting on the more expensive gravel ballast. Assuming the South Shore to be engaged solely in carrying freight, I would expect it to spend less than $7,000 per annum for ballast,—meaning, if the passenger service was taken off and the freight service was not increased in speed or volume,—including the cost of applying the ballast, at least 30% less, which would represent the difference between St. Ignace ballast and cinders.

Where the track returns, after the train has passed, to practically the condition in which it received the train, the elastic limit is not passed, though there would be quite a large track damage. A low joint springs up to its former surface. A rail does not acquire a permanent set, but the ballast is depressed and a permanent set occurs in it; the elastic limit of the ballast has been reached to the extent that it

has been displaced—that and the roadbed beneath it. That would be a very minute degree for each train passage.

Q. So you don't agree that the train, traveling at a fast speed over a reasonably level and straight track, would cause somewhat less wear at a higher rate of speed?

A. I do not.

1382 Q. Due to the fact that it is a shorter time in the place, and that there is a motion which keeps it up?

A. There is no such motion.

Q. You don't agree with that?

A. I don't agree with that proposition. The whole track structure is depressed below the normal plans, and there is an appreciable wave or elevation of the track material ahead of the train; the enormous weight of the train presses that structure down in the ground, and there is a perceptible wave ahead of the wheel, and that little front wheel of the locomotive is climbing up hill all the time, and shoving that rail ahead of it, and in time causes that rail to creep, even up hill, where fast speed is made.

Q. Isn't that hill a little higher before a train that is standing still than one that is in motion.

A. I have never measured it. I don't believe it is.

Q. You don't know?

A. I don't know, but I don't believe it is, from my experience.

Q. You don't know whether it is a little higher ahead of a slow moving train than ahead of a fast moving train?

A. I don't know by actual measurement, and I never had occasion to measure it on slow running trains.

Q. Applying the rule of physics to it, it would be lower in front of a fast moving train than in front of a slow moving train, would it not?

A. From my experience, I would expect it to be higher ahead of a fast train than ahead of a slow train.

Mr. Eldredge: Of course, you both mean equal weights, I take it?

A. Yes, equal weights; the same engine.

1383 The Master: Does the attraction of gravitation act to the same extent on a fast moving body as it does on a slow moving body?

A. My recollection of the force of gravity is that it is constant.

The Master: Does it have the same effect?

A. I believe so; that is my recollection of it, except possibly when you come into discussions of the inertia of the mass.

The Master: Doesn't the momentum of the body have a tendency to overcome, to some extent, the attraction of gravitation?

A. Yes.

With respect to yesterday's testimony regarding Thompson's alphabet, I didn't mean to include in the 2% estimate that I made on cross examination the excess tonnage, or the property feature; that 2% allowance was made in reducing passenger to 60% and freight to 40%, from 62% to 38.75%.

I didn't examine the South Shore bridges closely, and could not tell you that I noticed a good many wooden trestles; I did not find

out how many there were for the freight service alone. The higher speeds, even to 90 miles an hour, are made across bridges. On a single span of trestle, no more than one locomotive would be permitted at a time. Generally speaking, the customary practice is to assume a certain load, of, perhaps, double header locomotives, and a certain weight per foot of train behind it. The stresses are figured out for that weight, and then in the calculation a certain allowance is made so it will stand a strain of 4 or 5 times that, and that is called the factor of safety. The greater the span, the slower the speed—the lower you can have your factor of safety. It is not likely that any one of the spans of wooden trestles on the South Shore would stand the weight of 20 locomotives, standing still. I would not say that it is not a fact that a locomotive rolling across a bridge with power shut off does practically no damage to the bridge; I will say
1384 that it might be less, because of absence of tractive force and the effect of counter balancing.

Q. Now, Mr. Lindsay, assuming that the load for which a bridge is designed is four or five times the weight of the locomotive, and assuming that your formula, at speeds of 40 miles an hour, provides for locomotives piled three miles high, one on top of the other, isn't there something wrong with your formula?

A. The assumption is absurd.

Q. If your formula produces that, isn't your formula absurd?

A. It is not, because the assumption is incorrect, in the beginning, and violates all principles of bridge engineering.

Q. Assuming, also, that the application of your formula, at speeds of 60 miles an hour, assumes locomotives piled seven miles high, on top of each other, that is the weight that you have provided for, that is, the loading of the weight by the square of the speed at 60 miles an hour, would you then concede that there is something wrong with your formula?

A. I get your point. The action of a moving train on a bridge, if the bridge is on a curve, the mass is not standing upright, but it is horizontal, and you get the longitudinal effect of that mass striking the bridge on the curve, and not the vertical load.

Q. Then your formula is the formula for direct impact, is it not?

A. It is the expression of, I think, Newton, who calls it kinetic energy.

Q. But you engineers term it the formula for direct impact?

A. Bridge engineers, I think, probably used that term, and in their calculations they probably confined the discussion to the exact amount of the train and engine and cars on the bridge, or
1385 that may be on the bridge, at any given time, with due allowances for speed.

Q. I also wish to call your attention to the fact that applying your formula at 90 miles an hour assumes locomotives piled 16 miles high on a single point on the bridge or on the track structure, wherever it might occur; that would be absurd, and the bridge and locomotives would all go down very materially, wouldn't they, if there were 16 million pounds.

A. The assumption does not follow my ideas at all. As I have

explained, the mass moving in a horizontal plane, assuming a level track and rolling across a bridge, the effect of it is the thrust in a horizontal plan, and not a vertical; on the bridge, you would only get the vertical component of that load.

Q. Yet, you have assumed that the track damage will vary with the square of the speed?

A. The cost of maintenance of bridges is so relatively small, as compared to the cost of maintaining track, that it has been given a very small value in that formula.

Q. Let us eliminate the bridge for a moment. Your formula, then, applied to the track structure, assumes that the damage to the track increases as the square of the speed?

A. Yes.

Q. And the square of the speed, increasing to 90 miles an hour, would multiply the tonnage by 8,100, would it not?

A. By 8,100.

Q. By 8,100, and that assumes, does it not, that the damage to track structure at 90 miles an hour is 8,100 times as much as at one mile an hour?

A. Yes.

1386 Q. And that same thing can be applied to speeds of 60, where the multiplier produced by the square of the speed would be 3,600?

A. Yes.

Q. And also 40, where the multiplier produced by the square of the speed would be 1600?

A. Yes.

Q. I understand that fully, and I understand the method of your application. Now, take on ordinary sidings, like they have on South Shore, about what speeds would you advise on those?

A. 15 miles per hour.

Q. The maintenance would be for 10 miles an hour?

A. Yes.

Q. And the limit of safety might carry it to 15, or even, possibly, a little more?

A. Oh yes, much more.

Q. On those tracks which are constructed for speeds, we will say, of 10 miles an hour, you have said they bear the ratio of 2 to 1, or approximately that, to mileage of main line?

A. That is the ratio that we used.

Q. That is about a proper ratio, 2 to 1 to 3?

A. That is debatable; Mr. Thompson makes it 3 to 1; some make it others; some make it less; the whole subject is still under discussion by engineers, generally—by the largest engineering body studying railway problems in the world.

Q. Applying your formula to that particular track, and raising that particular track to a 40 mile an hour track, while you carry it at the ratio of 2 to 1, or something like that, would, under your formula, involve the expenditure of 16 times the amount

1387 that you have in there; does that indicate anything to give you any doubt about the correctness of your formula?

A. I have from the very start said that the V square would be the maximum, and that that would have to be shaded, as based upon, or determined upon, other conditions. The fact is that we have on our slow tracks, on the Mohawk Division of the New York Central railroad, been operating our slow freight trains at speeds of about 15 or 20 miles an hour, but the increase in the density of traffic has necessitated our operating the trains on those slow tracks at high speed, and it has resulted in a very material increase in the expense of maintenance of those tracks. We don't separate the costs as between one track or the other. I cannot say, but I know that we have had to take out all the 80 pound rail and relay it with hundred pound rail, and increase our tie renewals, and use stone ballast instead of gravel ballast, and that process must continue, and it has increased our labor cost, etc. There are a great many elements in the maintenance of the track that, perhaps, are not affected by the square of the speed, may be directly as the speed, and so on.

Q. I have understood, throughout, that your formula provided, not for track destruction, but for maintenance to the point of permitting the certain speed?

A. Generally so.

Q. Permitting, say, the speed of 40 miles an hour, if that is the speed that we use, the excess cost over trackage permitting speed of 10 miles an hour would be the difference between the square of the speeds multiplied into the tonnage; that is your formula?

A. I mean to say that, as tonnage increases, expense of maintenance increases, but it does not increase in direct ratio.

Q. My question was principally directed to the speed part?

A. I was coming to the speed, and my contention is that,
1388 as speed increases, the cost of maintenance increases more than at a direct ratio, and that I believe it is somewhere between a direct ratio and the square of the speed.

The Master: That is as far as you go, is it, to say it is somewhere between the direct ratio and the square?

A. Between the two. The whole subject is so unstudied, I might say, and still so vague, that I wouldn't undertake to say that that is an absolute formula. M. V. square could be applied with unfailing reliability and accuracy to all the details and to all cases, but I believe it is a fundamental principle underlying the whole proposition.

The Master: That is an enormous difference, isn't it, between a direct ratio and the square?

A. The direct ratio, under the assumptions of tonnage that have been given here, would change the relative passenger and freight from 60-40 to 45 passenger and 55 freight.

Q. The direct ratio?

A. Yes sir, I have got it 45-55—45 passenger and 55 freight, instead of 60 passenger and 40 freight. Those are the limits between which I would expect to find the right line.

Q. Now, referring again to the branch tracks and the equation of 2 to 1, on that assumption it would double the expense to raise the secondary track to the point of the main line, on the assumption of

2 for 1; and yet, if you apply the direct ratio of increase of speed to 40 miles an hour, you would multiply it, instead of by 2 by 4; that is the fact, is it not?

A. Yes.

Q. And if you used the square of the increasing speed, you would multiply it by 16, instead of by 2, would you not, with the speed of 40 miles an hour?

1389 A. I cannot follow your logic.

Q. I am asking you to answer the question. I don't care anything about the logic of it; I want you to answer the question, yes or no, or show me where I am wrong in asking it?

A. I don't understand the question.

Mr. Wykes: Read it, Mr. Luther, please, and let the record show you read it.

A. Could I delay the record long enough to write that question out, and let me look at it?

The Master: Yes.

Mr. Eldredge: I suggest that I think, from what the reporter read, he must have what precedes it or he cannot answer it intelligently at all.

Q. Before we go to that, there are the correct figures on the figuring that you did; will you check yours, to see whether you are right. Let me put it in another shape, that Mr. Parker has it here on his sheet, and perhaps we can get it in shape. Mr. Lytle has testified to a cost of maintenance for this secondary track of $350 per mile, and we will assume that it is kept in condition for 10 mile service, that is, for a speed of 10 miles; that fluctuates up. Main track, you have said, and I think the record proves that you are about right, costs $1,000 a mile to maintain; now, applying your formula to the branch, maintained at $350, squaring the 40 miles that is permitted on the main track, we produce a factor of 1,600 as the square of the speed; now, multiplying that speed into the cost of maintaining the track at 10 miles an hour would produce a cost of maintenance for main line of $5,600 per mile?

Mr. Eldredge: One moment. I object to the question, because the assumption is that the expenses to which witness has been referring include only the expenses that the witness has been

1390 applying his formula to, whereas, as a matter of fact, they include many other and different items of increased cost, to which the witness has not attempted in any way to apply his formula.

Mr. Wykes: You must not forget that Mr. Butler took Mr. Riggs through the items of maintenance of these spur lines, and that the items of maintenance that were left when he got through were limited practically to those which this witness says he affects with this particular factor.

The Master: You may put the question as a hypothetical question.

A. Do I have to answer that question by yes or no?

The Master: You may explain.

Q. I wish you would answer it by yes or no, first, if you can.

A. I would say, theoretically, yes; but that is the striking and strongest proof of my argument that the expense does not increase with tonnage at slow speed—that, on a track of that character, you can increase your tonnage without materially increasing your expenses.

Q. But you cannot increase your speed without increasing your expense in accordance with the square of the speed, if your formula is correct, can you?

A. With the modifications that I have said as between the square and the direct.

Q. Making the modifications that you have given would reduce about 20 per cent; reducing the 5,600 by 20 per cent would take out of it less than $1,200?

The Master: How do you get the 20 per cent? I don't understand.

Mr. Wykes: It is the difference between 60-40 and 50-50, or, as he has put it this morning, 45-55.

The Master: The difference is the difference between the direct ratio and the square; that is the difference?

1391 Mr. Wykes: I fear you and I are not talking about the same thing.

The Master: Perhaps not.

Mr. Wykes: The witness has stated that, due to the fact that this peculiar condition resulted, he modified his formula from 60-40 to 50-50; what I wish to indicate is that, inasmuch as his modification was only a modification of 20 per cent, whereas it should be a modification of something like 600 per cent, he is evidently wrong in one place or in the other place.

Mr. Cotton: I object to the question on the theory that it assumes that the effect in the direction of a moving train is the same as if it were a vertical effect, and that there is no direct ratio between the striking effect of these two influences, or the two trains, and the expenses of the maintenance of the track.

Mr. Wykes: My dear sir, you must not forget that your witness' formula was a formula for vertical effect, or horizontal effect, I don't care which it is, horizontal effect of impact. Go back and read the question, Mr. Luther.

Mr. Eldredge: I am utterly unable to understand the question.

Mr. Wykes: I understand it thoroughly, and I also understand the witness' theory.

The Master: Let us find out if the witness understands.

Mr. Eldredge: That is no evidence that I do, and if I cannot understand it I would like to be certain that the witness does understand it before he answers it.

A. I don't know that I can answer your question, because I cannot follow your mathematics.

The Master: You don't understand the question?

A. I cannot comprehend what he wants me to decide upon.

1392 Q. We will get back to it again.

A. All right.

Q. You told me, what I stated, producing the cost of $5,600 a mile was theoretically correct—you said theoretically?

A. Yes.

Q. Now, in applying your formula to the tonnage, you did apply it theoretically, didn't you, in reaching to 60-40?

A. Very generally.

Q. You simply worked out the mathematical computation upon the tonnage as it was given to you?

A. To get 60-40, yes. I made the assumption that the tonnage was uniformly distributed all over the entire territory, and that all that tonnage struck every portion of that territory.

Q. And then you modified that from 60-40 to 50-50?

A. Yes.

Q. The range of difference between 60-40 and 50-50 is not over 20 per cent, is it?

A. I would have to figure that out. You have me so confused that I don't feel that I could properly pass upon it at the present time.

Q. I will say that it is about 20 per cent?

A. I am willing to accept your statement.

Q. A computation will indicate it at any time, on the figures that are on the record.

A. All right.

Q. What I want to get at is whether your modification is sufficient if the result of the application of your formula is to increase the maintenance of secondary track, which costs $350 a mile and which, on your testimony and on the testimony of Mr. Riggs, would cost from $700 to $1,000 a mile to raise to the point of main line,

1393 and if it is indicated that the application of your formula, instead of raising that to $1,000 a mile, raises it to $5,600 a mile? Let him answer it, and then put in your objection.

Mr. Eldredge: One moment. I will make my objection before he answers it, where it belongs. The witness' formula has only been applied to the destructive effect of traffic; the question implies that it applies to the difference in the cost of the construction of road, to which the witness has not applied it in any way, shape or manner. The question is directed entirely to the difference in the cost of construction of road.

Mr. Wykes: I beg to differ with Mr. Eldredge's statement, because the witness' formula was not directed to the making good of the elements of wear, but to provisions, as he stated, for taking care of a track at 40 or 60 miles an hour, or at whatever the high speed might be. Have you the question in mind?

The Master: Do you desire to have the question read?

A. Yes sir. The formula could not be applied to a condition of that kind.

Q. Let us take a condition of another kind: You have stated that to maintain the main line of the South Shore outside of zone one would take approximately $1,000 a mile per annum; you have also stated that, if you got rid of the passenger traffic, thus reducing your speeds to the freight speeds, you could reduce the costs by 20% or 25%, and yet the application of your formula, instead of indicating a difference in costs of 20% to 25%, would indicate a difference in cost which would raise the lower figure 16 times; then, is your formula correct?

A. The formula is correct, but the application of it is wrong, because you are applying it to other elements than those which
1394 are due to speed. You are applying it to everything, whether affected by speed or not, and my other figures were based upon the general maintenance of the property.

Q. That is true, but the effect, then, of the application of your formula to the speed items would tend to increase those 16 times; that is correct, isn't it?

A. It looks so, on the face of it.

Q. And yet you have only allowed 20% to 25% difference between the two services?

A. That is right.

The Master: Isn't the difference between the direct ratio and the square so great as to render the formula practically of little value?

A. The formula is, I believe, fundamentally correct in those items which speed affects; there are items in maintenance of track which speed does not affect.

The Master: With so great a margin, is the formula practically of much use?

A. I believe it is.

The Master: It leaves us very much in doubt as to where, within the margin, the fact lies.

A. There is perhaps an area there of doubt, a river of doubt, so to speak, but I believe that the use of a proper consideration for the speed at which traffic moves is fundamentally the principle on which the division should be made.

The Master: By assuming that to be true, is this formula which you have given the best and most accurate way of getting at that?

A. I believe so.

The Master: You don't know of any other way?

A. I know of no other way.

1395 Q. Your formula is a rule, but you admit that it must have modifications?

A. Yes.

Q. Now, give us the rule, so as to make it a part of the total rule—the rule of modifications?

A. That is largely judgment.

Q. Entirely judgment, is it not?

A. Entirely judgment, so far as this science has advanced.

Q. And so, in the application of your theory, the question of whether there is a profit or a loss in a particular service gets down to the point of depending upon the judgment of the witness, does it not?

A. Largely. Engineering, you know, is education 2% and 98% common sense.

Eccentric wheels are somewhat more numerous in freight than in passenger service. I have never ascertained the degree of variation from round. In freight service on South Shore, assuming 3,000 cars, there would be 24,000 wheels, and in passenger service, assuming 71 cars, there would be approximately 850 wheels, so, depending on speed, if there is damage due to that element, it is more prevalent where the wheels are more prevalent. At equal speeds, it varies with the number of flat spots, or eccentric wheels; the action of a small flat spot is greater at high than at low speed.

At equal speeds, it would increase as the number of wheels increased. The presence of foreign cars, representing an interchange debit balance of $46,000, or 100,000 foreign car days in a year, would also weight the freight side to some extent. The freight car
1396 wheel is ordinarily cast, and not turned. The eccentricity which may result is due to the different rates of shrinkage of the casting as it cools, and in part to the density of the metal as it cools. Some parts of the wheel wear out faster than other parts; there are often differences of as much as one-half an inch in the thickness of a locomotive tire, and that causes track injury at high speed. Locomotive and passenger car wheels are a true round when they come out of the factory, and they vary only as sliding or breaking causes wear. A very slight irregularity, whether flat spot or eccentricity, will produce, at high speeds, perceptible track damage; the damage at slow speeds—say, less than 30 miles per hour—is insignificant. I do not think that they would produce much damage below 30 miles an hour, but at greater speeds we see the effect of the flat spot on the rail.

I have never figured out the maintenance cost of producing a car mile, a train mile, or a ton mile, and know of no one who has. I have not attempted to refine that problem between the different speeds, at all.

I watched the South Shore ties closely, as I rode over the tracks to note rail cutting and rotting, and examined the percentage of renewals, and I gathered the impression that the renewals were ample and well distributed. A good tie life for a tamarack tie in this country would be 6 or 7 years; if the line were devoted to exclusive freight service, dependent on ballast conditions, the life would be in the neighborhood of 6 or 7 years, and, if you had a mixed service, you would probably get more than 6 years life out of them. We take ties out of our railroad on passenger tracks sooner than out of freight tracks. Assuming the L. S. & I., practically an exclusively freight road, has tie renewals on about the same ratio as South Shore, rather than say South Shore was not maintained beyond the needs of the freight service, I would say L. S. & I. was maintaining that track to a higher degree of excellence; whether higher than necessary would depend on the charac-
1397 ter of their freight traffic, of which I am not able to judge.

Track maintained at a lower standard of excellence than the South Shore might increase the cost of their car and locomotive repairs; just what the extent of that would be it would be diffi-

cult to ascertain or estimate; you would have to have experience to do that.

My answer, that the passenger cost of carrying employees and free passengers was inconsequential, was that it was generally so relatively small that it was inconsequential; I have no figures to indicate that, and can only assume by analogy to our own experience. You could add 10%, 15% or 20% more passengers to the moving equipment, without increasing costs, on the same principle that you could increase the tonnage in a dense territory without increasing expenses.

My formula makes no provision for the segregation of tracks used exclusively in certain services, and makes no loading for the greater use of terminals, extra sidings or switches, or things of that character, by freight service; it simply applies to the line over which the speeds taken into account are made. To properly apply that formula, you would have to divide the territory, first into zones, then allocate tracks wherever possible, and apply the judgment, after that. If it were indicated that 32% of the time of freight trains is engaged in doing stational work, that, so far as the cars are in motion, would weigh the freight side.

An ordinary freight train of 30 cars would be 1,200 feet long, and it would be good operating wisdom to make the passing siding long enough to take care of a train of that length. Where you have a longer passing track than your longest freight train, that would possibly involve its use by two freight trains. It is as necessary to get the passenger train by the freight as to get the freight by the passenger train, and the freight by the freight.

1398 LINDSAY.

Redirect examination.

By Mr. Eldredge:

On our fast passenger tracks, it has been necessary for us to restrict the speed of engines running light to 45 miles per hour, as we found that above that speed causes undue injury to the tracks; a locomotive running light would do more damage than drawing a train, at the same speed.

LINDSAY.

Recross-examination.

By Mr. Wykes:

In my conferences with Mr. Eldredge on the days since going over the line, there were present Messrs. Eldredge, Cotton and Tracy; and, at one conference, Messrs. Berry and Howard were silent witnesses. I went over the evidence that was presented to me before them. (They have been present in the court room during most of the witness' testimony.)

1399 On July 16, 1914.

JOHN B. BERRY, a witness called by plaintiff.

Direct examination.

By Mr. Cotton:

I live at Oak Park, Illinois; am a Consulting Civil Engineer. After graduating from high school, I graduated from Day's Academy, as a civil engineer. I devoted one year to a post-graduate course in the same school, in higher mechanics and designs of bridges and trestles. I worked, during vacations, on the West Shore terminal at Weehawken, N. J.

My active work began with the Northwestern, with whom I spent twenty years, the first fifteen on location and construction of new lines, and as Roadmaster, Bridge Superintendent, and Division Engineer of what was then known as the Wisconsin and Galena divisions. As division engineer, I co-operated with division superintendent in getting economical operating results. The last five years of service with Northwestern I was Chief Engineer of lines west of Missouri River, in charge of location and construction of new lines, and had a strong voice in the maintenance of the existing lines.

I then went to the Union Pacific, as Chief Engineer, when Mr. Harriman bought in, and was with them over seven years. During that time, we developed and built and changed all of the Union Pacific railroad as it is today, and developed other lines, since built.

I was also, for two years, Consulting Engineer of the Oregon Short Line, directing its policy of economics, and with the Oregon Railroad and Navigation Company, in consultation on engineering questions. With the latter, I acted because Mr. Harriman directed the presidents to consult with me in all of the economics or large engineering questions on their line.

1400 While Chief Engineer of the Union Pacific proper, I kept close track of the use of rail, ballast, expenditures per mile, the economics of grade reductions, changes of line, etc. While there, I was delegated to investigate other lines Mr. Harriman had in mind to purchase. At the time that they talked of building what is called the Lucin cut-off, Ogden to Lucin, about a hundred miles, I was a member of the Board consisting of Mr. Hood, Chief Engineer of the Southern Pacific, Mr. Krutschnitt, General Manager, Mr. Burt, President of the Union Pacific (also engineers), and myself, as to the desirability of building the line.

After connection with the Union Pacific, I went to the Chicago, Rock Island and Pacific, as Chief Engineer, with duties similar to those on the Union Pacific. While with them, over seven years, I was part of the time Supervising Engineer of the Frisco lines. At the time of the divorce of the two roads, I was divorced from the Frisco work. During that period, I did considerable special work. For example, the Grand Trunk & Wabash used the same tracks from

Detroit to Suspension Bridge and Black Rock. The Wabash wanted a new contract for trackage over the Grand Trunk. They employed me to work up the value of that line; they accepted my valuation.

I also served in charge of the valuation of a piece of joint trackage between the Illinois Central and Vandalia, part of the Pennsylvania system, between Maroa and Decatur Junction. They accepted my decision and valuation. I made a report regarding the value of other lines for the Union Pacific, and worked for them until April, 1914, when I resigned and opened an office as a Consulting Engineer, in Chicago.

While with the Rock Island, I was Chief Engineer, until I resigned as such, in April 1913, at the request of the President, and for one year I was Assistant to the President of the Rock Island.

1401 During that period, I was one of five engineers of the western group of railroads, lying north of the Ohio and west of the Pacific coast and south into Texas, in negotiations to agree upon basic principles as between the Government and the railroads, under Federal appraisal, meeting with the Government and Mr. Prouty; when I left the Rock Island, I left that position.

I am the Mr. Berry to whom the President of the United States tendered a position as a member of the Board of Consulting Engineers, to determine upon the advisability of either the sea level or lock of the Isthmian Canal.

I have also done work for the Canadian government, making a report regarding the Grand Trunk Pacific.

While Chief Engineer of the Rock Island, I was employed by the Northern Pacific, to estimate the value of their property to be used in the Minnesota and the Spokane rate cases. I did that, and testified in both cases.

I am a charter member and was twice director of the American Railway Engineering Association. I was one of the first members of the Economics Committee; am now a member of its Rail Committee, and a joint member of the committee, of that Association and the American Society of Civil Engineers, on Stresses and Track, of which latter society I am also a member.

In 1898, when we started these large expenditures on the Union Pacific, about the only good work on the Economics of Railway Location was that by A. M. Wellington, a very very able man. The work called the Economics of Railroad Location, bulletin No. 49 of the American Railway Engineering Association, was the result of my effort to simplify the use and application of Wellington's work to work of location.

1402 I have had over 35 continuous years of service on railroads; about $150,000,000 has been expended under my direction during that period. I have given attention not only to railroad construction, track construction, roadway repair and maintenance, and railway operation, but also to the effect of operation on track, roadbed, bridges, trestles and other structures, and also in reference to the amount and causes of expenses incurred in the different kinds of business conducted by railways.

I also prepared the value of the Rock Island in Oklahoma and

Arkansas, getting ready for the two-cent rate cases in both states, and not only as to the value, but somewhat in the accounting methods of maintenance of way and structures subdivision, and, as to all expenses that could not be allocated, I was consulted, in a minor way, as to the best way of arriving at the percentages.

I spent four days in examination of plaintiffs' railroad, riding over it on trains; the purpose was to examine quite minutely into the general condition of track and structures. As a whole, I think the physical condition of South Shore as good as it ought to be for the character and extent of the traffic. On the west end, largely in Wisconsin, where they had much 60 pound rail, I did not think the condition of track hardly as good as it should be; this was true, Nestoria to the state line, though I thought, there, that even that poor rail rode as well as could be expected. I found the line, Nestoria to Houghton, better than I thought it was there. The condition of the right of way on the whole road was excellent, and much better than on ordinary roads.

The officers of the railroad with us always got out when we stopped to make any examination, and freely gave us all information we asked for. I found the frogs were of the latest type, and the split 1403 switches 15 feet long, well reinforced and of modern construction. I found a great many timber bridges had been taken out, filled, and culverts of reinforced concrete put in; the new type of bridges were ample for any type of locomotive then on South Shore.

I asked Messrs. Jackson and Stafford (division superintendents) how they were elevating curves, and they gave me their table. I wanted to see how it compared with results found. I worked out the formula and elevation in use by South Shore up to 7 degree curves on the basis of 35 miles an hour, as I was told that was, and it afterwards proved, about an average rate of speed, minimum and maximum. I found that the elevations they were using were very near to those I calculated for the formula. It was not alike around every curve; it never is, on any railroad, unless the maintenance is of a very high order, but it did not vary enough to be marked, except in a few cases. On the 20 curves that we examined we found no elevation higher than 5 inches, and only one of that height, and in my opinion there is no greater elevation on any of the curves I passed over. We examined only representative curves in Michigan, so as to get a representative statement.

The passenger train service on this road was fully as good as any other road similarly situated, taking into consideration the business necessities. On the inspection trip, we took observations of train speeds; for 9 miles west of Winthrop Jct., I took the speed, which averaged 35 miles an hour, including the little slow-up for Winthrop Jct.

On July 8, Mr. Howard and I took the time of arrival and departure of passenger train No. 1, St. Ignace to Marquette, at each station, and the time between mile posts for the whole distance; the results were platted on a profile. (Marked Complt.'s Ex. 95,

1404 Berry.) This profile correctly shows the results of our observations. Statement of the trip and results is as follows:

St. Ignace to Soo Junction:

Left St. Ignace at 9:38 A. M. Reached Soo Jct. at 11:20 A. M. Distance 42.9 miles; time 1 hour 42 minutes, or 25.25 miles per hour.

Deducting stops at intermediate stations, running time was 1 hour 20.5 minutes, or 32 miles per hour.

There were eight of these intermediate stops, and another point, Greene, where the train came very nearly to a standstill, making an average of about one stop every 4.3 miles.

It takes some time for the train to attain full speed after a stop. There is also a slowing down for a short distance as th estation is approached, so that to attain the actual average full speed between stations it is necessary to eliminate miles in which stops actually occur, and the preceding or following mile, when the stop is at or near the end of a mile. As it takes less time to slow down than to get up full speed, it seems probable that, considering trains both ways, full speed may be expected up to within a half mile of the station, and even past the station itself for such trains as fail to stop.

Eliminating from this run the miles in which speed was reduced for stops, as above indicated, as also the first two miles from the dock at St. Ignace, the speed ranged from 32.7 to 48.6 miles per hour, or an average for 26 miles of 42.5 miles per hour. These speeds ranged as follows:

Over 30, including 35 miles per hour, 2 miles.
Over 35, including 40 miles per hour, 5 miles.
Over 40, including 45 miles per hour, 13 miles.
Over 45, including 50 miles per hour, 6 miles.

Soo Junction to Marquette:

Let Soo Junction at 11:40 A. M. Reached mile post 155 opposite Marquette station at 2:57 (and backed into station at 2:59). Distance 108.4 miles; time 3 hours 17 minutes, or 33 miles per hour.

Deducting stops at 16 interme iate points, running time was 3 hours 3.5 minutes, or 35.4 miles per hour.

Eliminating from this run the miles in which speed was reduced for stops, as above indicated, as also the last two miles going into Marquette, the speed ranged from 30.5 miles to 53.7 miles per hour, or an average for 76 miles of 42.86 miles per hour. These speeds are as follows:

Over 30, including 35 miles per hour, 7 miles.
Over 35, including 40 miles per hour, 14 miles.
Over 40, including 45 miles per hour, 25 miles.
Over 45, including 50 miles per hour, 23 miles.
Over 50, including 53.7 miles per hour, 7 miles.

1405 On inspection trip, I noticed no maintenance or construction in excess of the requirements of the case, except, perhaps, the park at Marquette, park at Soo, and ladies' waiting room at Sidnaw; these are for passenger traffic, particularly.

It is in evidence that the average freight train speed is 16, and passenger train speed is 27, miles per hour, that passenger trains, frequently, for shorter or longer distances, make 35 to 50, and occasionally, but infrequently, 60 to 63.6 miles per hour, and that freight trains make occasionally, but infrequently, 25 to 35 miles per hour; under those facts, per unit of weight, the passenger train involves the greatest destructive effect upon, and requires the highest maintenance of, track, roadbed, track structure, bridges and trestles, on both curves and tangents, where the depreciation is due to mechanical wear, or destructive effect of traffic.

The locomotive is a more destructive agent, and has greater wear effect on track, than a passenger or freight car; the passenger engine running at high speed is more destructive than a freight engine of the same tonnage and character at low speed. The higher rates of speed and tonnage are more destructive to track than the lower rates of speed on a passenger train. The effect of speed is to unsettle the roadbed, hammer the joints harder, and make it necessary to spend more money to keep the track up to meet the conditions of high speed as compared with low speed; the effect is more pronounced on bridges than on track.

In my opinion, it has been the practice, where traffic was confined exclusively or almost exclusively to freight traffic, that there is not so much money spent on either material or labor, to keep the track up, as where there is combined passenger and freight service; that would apply to this particular instance. It applies in minor degree
1406 to bridges; to buildings very decidedly. I would not design a permanent bridge for a lighter load for freight traffic than for passenger, but for any wooden bridge I would wear it longer. The first and important consideration is to make your bridge and structure ample for passenger service, and guard against possibility of wreck. Freight locomotives run at slow rate of speed, and while you might design a structure with less impact for that lower speed, I know of no engineers who do that in connection with permanent bridges.

On the wooden bridges, you would endeavor to carry them along, and piece out by getting at the rotten part and putting in a post; in that way they would last longer. Also, a passenger engine, running at high speed, is more apt to produce a break or crack in a stringer or cap than the same weight of engine at low speed. In a soft, marshy country, the speed and tonnage of the passenger train is apt to settle the piles into the ground more than the freight train, and you would not try to keep up smooth surface for the freight, as you do for the passenger service.

These remarks would apply to ballast, rails, ties and track structures or appliances. This railroad would be required to expend in maintenance of way upkeep, if it had only freight service, at least 25% less than the present service costs.

Referring to Thompson's testimony, that the greater wear on curves is on outside rail, and that wear on outer rail on curves is about 20% above wear on tangent, and on inner rail about 5% above wear on tangent, I say wear on rail on curves depends on degree of curve, loca-

tion and speed. On lighter degrees of curve, say 1 or 2 degrees, the excess wear is but little; but, as you go on to the high curves, say 3 to
12, it increases very fast. I cannot agree with Thompson,
1407 that the wear on outer rail would be but 20% above the wear on the same rail on tangent. (Objection that, as this subject is deemed important, we should have actual figures of rail renewal on curves from company books.)

On the rails I examined on 4 to 7 degree curves, I would say that, with the same traffic, the rail on tangent of the same weight would last 10 times as long as on those curves on this railroad. On those curves, it is evident that the rail has been taken out at least once, and presumably more; in cases, the rails were transposed from lower to upper side. The tangent rail adjacent to that is frequently in good shape, with very little loss. Tangent rail everywhere shows that its life is a great deal longer than on those sharp curves, as quoted by Thompson (Note: Thompson did not refine his answer as to the degree of curve, and answered evidently as to his judgment of the average, while the witness has testified only as to the sharper curves.) On 4 to 8 degree curves, the life of the inner rail is but little longer than the outer, and it would not last more than twice as long; the tangent rail would outlast it 5 or 6 times.

I should say this railroad was in good condition, and reasonably well maintained and kept up for efficient service and safety, considering its present business. Taking into account the items of maintenance of way and structures which cannot be allocated, but which are common, I should say the passenger train mile creates the greatest amount of these expenses on this road; my only reason is that the revenue passenger and revenue freight train miles are very nearly the same, and, that being the case, with higher speed of passenger trains the cost increases.

Where there is no passenger service, the cost for maintenance of way and structures expenses would be much less; the speed of passen-
ger, as compared with freight, trains produces a large main-
1408 tenance charge, it having greater destructive effect on track, because the track is affected by speed as well as tonnage.

Answering Thompson's testimony, that the imperfections of freight equipment constitute the principal cause of expenses, over and above the difference in train weights between the freight and passenger train miles, and his 8 reasons therefore, I do not believe that the imperfections of freight equipment constitute the principal cause of difference in expenses over and above differences in train weights.

(1) It is true that car wheels in freight service are not run with their axles as nearly parallel as in the passenger service, but that is of small consequence.

(2) It is true that freight trucks are not so good or expensive as passenger trucks, but they are ample for the service they perform.

(3) The fact that freight car wheels are chilled iron, instead of steel tired, wheels is true, but it has no bearing on the question of difference in expense.

(4) That freight car wheels are eccentric, egg shaped and not true circles, is principally true, though the expression "egg shaped" is not

proper; they are not turned true, like the passenger wheels or locomotive tires, but are put on as they come from the factory, and may be a little eccentric, but not appreciably so.

(5) As to the freight train wheels, due to irregularity, being apt to freeze in the brakes, there is a little of that, depending on pressure, but I would say that it is extremely trivial, as the wheels on all passenger engines and cars wear spots on them as well as on the freight cars, being a little rough, so that they are just as apt to stick in one as in the other.

1409 (6) It is true that the springs under freight cars are not so expensive as under passenger cars, but they answer their purpose, just as the difference between a buggy and a lumber wagon. It would be a great misfortune for a freight train to have very much spring effect.

(7) It is true that freight trucks do not turn as readily on their centers as passenger trucks; but I do not think they need it; it is small, anyhow.

(8) I do not know what Thompson means when he says the irregularity of freight car wheels is an appreciable item of cost; if it referred to destructive effect on the track I would say no, because the speed of the passenger train, with better wheels, would produce a worse effect than the freight car wheels, with their little irregularity.

From my knowledge of this road, and knowledge generally, I do not think that these imperfections constitute the principal cause of difference in expense, over and above the difference in train weights, between freight and passenger train miles. I should consider the imperfections in the freight equipment a minor item. I have read Mr. Thompson's testimony regarding his gross ton mile ratio, on which he divides maintenance of way and structures expenses due to mechanical wear or destructive effect of traffic. I do not believe this is proper, as it neglects the excess wear due to locomotives as against cars, and neglects speed. It does not charge up to the passenger service as much as it should. In my opinion, weather stress is the principal item affecting ballast. On South Shore, I cannot give the percentage of expense of maintaining ballast properly chargeable to passenger; it would be more for the passenger than for the freight. I would not divide ballast on gross ton mile basis, or basis for mechanical wear.

The principal cost of tie depreciation on this railroad is rot; the minor element is mechanical wear. In 1914, they are going
1410 to put in about 333,000 ties, 290,000 in Michigan, 81% hemlock and 19% cedar. Hemlock and tamarack rot out before they wear out, and cedars crush by the service; so I understand, from these renewals and from the fact that I am advised that for one or two previous years there was a greater proportion of hemlock and tamarack than of cedar, that 81% of this year's tie renewals would fail due to rot, and 19% to mechanical wear. The average life of hemlock and tamarack ties in this country is 6 to 7 years; under some conditions, cedars are good from 12 to 14 and in cases to 20 years.

The greater causes of depreciation of ballast on this road are the passenger trains at the higher rates of speed; the moving load with

high speed has a tendency to crush the ballast down, and necessitates its renewal more often.

In my judgment, Ratio 1, gross ton miles, would not properly divide common expenses of ties, repair or renewals of rails, ballast, track maintenance and track surfacing and other material, because the gross ton mile considers straight tonnage, without consideration of engine effect or of speed.

In criticism of Thompson's application of the time ratio to common expenses due to weather stress, decay or erosion, that method of division of those expenses is not, in my judgment, proper or accurate for application to these expenses. The method is new to me. Of all the methods for pro-rating expenses or value, it has the least merit. As to its application to value, many of the charges don't vary with traffic. Supposing one passenger and one freight train a day, does it look reasonable to compare a passenger train over the road at 30 miles an hour with a freight train over the road at 15 miles an hour, and allot the proportion of value in that proportion? For an interlocker,
1411 it makes no difference whether the train uses 2 or 40 minutes, so long as it delays no other train. The expense is there just the same.

Take a bridge a mile long and a passenger train 30 miles an hour and a freight train at 15. The maintenance of that bridge for the passenger will be greater than for the freight train, without regard to its length on that slow train, because it is not interfering with another train, and the necessities of keeping the structure up to a higher degree of perfection, and the possibilities of damage to members of a wooden bridge, are greater by the passenger than by the freight. I think the crux of the whole thing lies in the fact that it is ridiculous to make such comparison, when you know all the facts are against it. That would apply also to the common expenses of maintenance of way and structures.

I cannot say where formula 4 could with justice and equity be used for any purpose whatever on a railroad. It should not be used in connection with depreciation, and it is grossly misleading. It is not proper, accurate, or approximately accurate to divide common expenses due to weather stress and depreciation. I never heard of gross ton miles for division of common expenses between freight and passenger, and never heard of Thompson's time ratio before. Thompson's time ratio is not proper to divide common property between freight and passenger service. On South Shore, the revenue train mile more nearly accurately measures the division of unallocatable expenses of maintenance of way and structures between passenger and freight traffic than the Thompson ratios, because it closely approximates what I think is the best method of dividing those expenses, and is nearest to certainty.

Other roads use the revenue train mile, but many other roads are using various other methods besides the revenue train miles, or even
1412 the gross ton miles. Some roads have been using the gross ton miles unequated; they have used other methods, such as cost accounting and speed ton miles. They are trying more nearly each year to get speed as a factor, as well as straight tonnage.

I know of no case where they have used gross ton miles without the equivalent of speed.

On bridges, the passenger locomotive at higher speed, if of the same or greater weight, and possibly if of lesser weight, causes the greatest destructive effect. The locomotive at high speed would produce a greater blow than lateral or side motion of locomotive at slow speed. The side motion would be small in comparison. A locomotive, being of heavier weight, its wheel would, at the same speed, produce worse effect than the lighter weight of a car wheel. I know what snow plows and devices are employed on this road, and where the greater cost would fall; it would be preferably to passenger. (Witness repeats the oft repeated claim of necessity of keeping the road open for passenger service.)

In reply to Thompson's testimony, to the effect that cost of taking the sidings by freight trains, to meet passenger trains, should be borne equally by passenger and freight, I am of the opinion that it is wholly a passenger expense. The freight train takes sidetracks at considerable delay and some expense, to let the passenger by. If it did not meet that passenger train, it could go on until it met a freight train, and there would be no necessity for that delay or expense. The passenger trains run first after road is cleared by snow plows.

I have read Thompson's and Lindsey's testimony regarding 28 reasons or elements alphabetically listed by Thompson.

The cost of transporting company material on freight trains, in my opinion, vastly out-weighs the cost of all the reasons Thompson has given against the freight, in favor of the passenger, trains.

1413 The greater tonnage of freight trains, as embraced in his first reason, would be very small.

The handling of people on South Shore trains free I would consider very small. I do not believe they ever had a single car for free passengers; until they do, the weight of the passengers transported free cuts no figure at all in the cost.

(Witness here led to change various answers to say that haulage of company material in freight trains would offset all items of Thompson alphabet but the extra tonnage.)

Mr. Thompson's statements in his alphabet, in a great many of the items, are correct as far as they go, but they are small, admitting a great many of them.

(*a*) Greater tonnage of freight trains. I do not know that that makes the freight train mile greater in cost than the passenger train mile; that is subject to analysis, and, in my opinion, with the revenue train mile in passenger and freight service very nearly the same—practically 50% each—I should say it is very small indeed.

(*b*) Greater number of wheel and wheel impacts in freight trains. This weights the freight side, but small in amount.

(*c*) Greater weight and tractive force required of freight locomotives. This may be true, but is very little; speed must be taken into consideration as well as weight.

(*d*) That freight train wheels, trucks and parts are not kept in as good condition as on passenger trains. This is true, but I don't think it cuts much figure.

(*e*) Greater axle loading of freight cars. This is perhaps so, and perhaps not; even if it is so, it would be small.

1414 (*f*) The greater time of use of the property by freight trains, because of slower speed. This is not so.

(*g*) Greater wear on tracks, both in the straight and on curves, attributable to more rigid freight train trucks. This is true, and weights the freight side, but does not amount to much, as on South Shore the proportion of straight line to curves is very much in excess; there is very little of what I term heavy curvature line, and long pieces of straight line.

(*h*) Greater number of derailments and injuries to track, ties, etc., in freight service. This weights the freight side, but I do not think it cuts a big figure.

(*i*) The difference in locomotive types in passenger and freight. I did not pay much attention to engines, except the heavier ones going on to the line since June 30, 1913, numbers 552, 553 and 554.

(*j*) The carrying of persons free by passenger trains, for both classes of service. (Previously answered at length.)

(*k*) The hauling of business and private cars by passenger trains. This weights the freight side, but it is very little on this road.

(*m*) The exclusive use by the freight traffic of large amounts of mileage of line, side tracks and spurs not used by the passenger traffic. This weights the freight side, but is small.

(*n*) The greater use of yards and terminals by the freight traffic in switching. This weights the freight side, but is small. In many cases, if not wholly, you can allocate those sidetracks in terminals and yards to the freight or passenger service using them, and what you cannot allocate would be very small.

(*o*) Double and triple tracking for the necessities of freight service. That applies to both; you do not increase your facil-

1415 ities until the demands of both require.

(*p*) The use of main tracks in freight service, in switching, in greater proportion than in passenger service. This weights the freight side, but doesn't amount to much; it is almost wholly confined to the use of a local freight train.

(*q*) The more frequent starting and stopping of freight trains, in road switching. This weights the freight side, but I do not think it cuts much figure.

(*r*) Switching done by road locomotives, not represented by train mileage nor by switching mileage until one hour is reached. This is an accounting proposition, and, as I remember, only a question of overtime.

(*s*) I think this is an accounting proposition, wholly.

(*t*) I know nothing about this.

(*u*) Greater length of passing tracks to be maintained for freight. This claim, I think, is so, in a measure; at best, it is not a big item.

(*v*) Greater cost of main line due to frequent presence of switches

for freight switching. This is true, and weights freight side, but is small.

(*w, x*) Greater number and cost of switches for freight. This is true and weights freight side, but is small.

(*y*) Higher center of gravity of freight cars, particularly ore. (Previously covered.)

(*z*) Greater movement of freight cars in stational work and switching. This adds to the freight expense.

(*aa*) The greater damage from freight, caused by greater number of flat spots on wheels. This is not true, as speed must be taken into consideration.

(*bb*) Greater injury due to reciprocating motion of freight engine sideways, varying with tractive effort, and greater at
1416 slow speeds. This is not true.

He (Thompson) says it is his opinion that the freight train revenue mile is more expensive to produce on this road than the passenger train revenue mile. I doubt it very much. He says he thinks it is considerably more than twice as expensive to produce the freight revenue train mile as the passenger revenue train mile. I don't believe that.

(The elements or considerations which are claimed to add to the cost of the passenger train mile and make it as expensive as the freight train mile are stated, and the witness asked his judgment with reference to correctness.) I think the statements are correct; they are of considerable importance.

Taking Mr. Thompson's alphabetical list of reasons to overcome excess speed in passenger while making the freight train mile more expensive, and eliminating (*a*) tonnage, (*m*) exclusive freight trackage, and (*n*) use of side tracks at terminals, and weighing against them plaintiff's seven items, some of them being important and some minor, I would say, without having any direct figures about it, that the value of the seven items of plaintiff's would be 60% to 75% as much as the remaining 25 of the 28 Thompson's alphabet items; i. e., if the value of Thompson's 25 items were $1,000, the value of the seven items would be $600 or $750.

My testimony yesterday was that, eliminating the first of Thompson's alphabetical reasons (tonnage), the remaining 27 items were more than offset by the cost of transportation of company material in revenue freight trains; the seven items listed are 75% of the remaining items listed by Thompson. That leaves out the weight on the freight side and the speed on the passenger side, and all other things.

The causes of depreciation on a railroad are wear, decay, obsolescence and inadequacy.

1417 Referring to Thompson's testimony, that passenger speeds average 27 miles and freight speeds average 16 miles per hour, and that the excess wear due to speed alone is probably not over 15%, it is my opinion that it would be very nearly twice 15%. I am taking into consideration that the train weights are the same. Speed increases stress and wear, and requires greater strength, stability and fitness of track and track structure, other things remaining the same.

It is true, in a measure, that the dynamic augment is the increase

of weight on track, due, in large part, primarily to imperfect counterbalancing of the main and side rods of the locomotive, rather than the movement per se; but, bad track is also a very strong feature, though not so great as the effect of badly counterbalanced wheels. There is nearly always bad counterbalancing of wheels.

(The statement from the Buhl case, Vol. 1, page 427, to the effect that locomotive mileage is responsible for one-half the wear and tear of track—with which Mr. Thompson disagreed—and the statement that the cost of maintenance, depending on traffic, should be divided between the different departments of service on the basis of locomotive mileage, switching included,—which Thompson agreed would be a more correct basis than with switching excluded,—read to the witness.) I don't believe locomotive mileage plus switching is right. Switching engines very seldom, if ever, go out of the yard, where they operate on many tracks. That maintenance charge is light, and it would be very difficult to get switching engine mileage. The locomotive mileage would not be a good factor, because it does not consider weight nor speed. I have never considered that as large a ratio, as one-half the wear should be due to the locomotive; it would be different for passenger or freight and freight engine.

1418 The engine effect might be, as to the locomotive tonnage including tender, multiplied by, for passenger, 4, and for freight, 2; that would represent my opinion of the relative destructive effect of locomotives on track and track structure.

Referring to Thompson's statement of the meaning of critical speed as being the point where the injury due to speed begins to decrease, as to whether that is the true meaning of the term, I do not believe it, and I think his statements incorrect.

The formula for impact for bridge work is: Impact is equal to static load plus 300, into 300, divided by 300, plus L, which represents length of span in feet. I am familiar with the report of the sub-committee of the American Railway Engineering Ass'n printed in the 1911 proceedings, volume 12, part 3. The formula there proposed by the sub-committee gives the maximum impact, takes into consideration varying speeds, poor conditions of wheels, the cars and engines, had counterbalancing, poor track conditions, and all other conditions of minimum character. The average passenger train speed of 27 miles per hour on this road would be within the limits of critical speed, and would produce greater cumulative vibration and impact than the same engine on a freight train at 16 miles an hour, assuming engines, cars and track in good condition.

If all the conditions were such as you describe—everything perfect—there would be no impact. On this road, with a single span of 150 feet, which is shorter than the shortest passenger train, a passenger train at a speed of 27 miles per hour, as compared with the same engine hauling a freight train at 16 miles per hour, the critical speed would not be reached in the case of the freight train, and I would, therefore, say that the greater cumulative vibration and impact would be produced by the passenger train. I think I know a formula that would be better than Thompson's for division of un-

1419 allocatable expenses between passenger and freight. It is: Take the weight of a passenger engine and multiply it by

4; take the weight of a freight engine and multiply it by 2; take the weight and contents of a passenger train and multiply it by 2; take the tonnage of the cars behind the locomotive and tender, in other words, the cars and contents, and multiply it by one. That takes into consideration all the elements that I believe should be considered. I have never had occasion to use it since I thought it a good formula. I cannot say anybody has used it.

BERRY.

Cross-examination.

By Mr. Wykes:

This formula is known as the "equivalent ton mile formula," and is found in 1912 report of American Railway Engineering and Maintenance of Way Association. I think it proper for general application, and approve it thoroughly. It would be applicable alike to the Michigan Central, New York Central or Pennsylvania.

On a 150 foot span bridge, a 27 mile passenger speed would be between the two extremes of critical speed, which the tests show are between 25 and 40 miles per hour. On the 150 foot span, the critical speed would be reached, but, in the case of freight trains at 16 miles an hour, the critical speed would not be reached. I do not think that on a 150 foot span the critical speed is reached at less than 25 miles an hour; occasionally, a case has developed that it does. The damage would begin to run off, inversely, as you begin to run up from 25 miles an hour; I think there is nothing appreciable to 27 miles. When you have reached the critical speed for that span, the cumulative vibration would drop off. I do not know what the critical speed would be on this particular length of span. I do not
1420 think it might be 22 miles an hour; the tests all show that it seldom occurs below 25 miles an hour.

I approve of the larger part of the findings of the sub-committee of the Railway Engineering Assn., from which I quoted yesterday. Those investigations were made for the purpose of determining the truth, and not for any particular case, but for the purpose of laying down general rules as near as they could be ascertained. In saying critical speed begins at 25 miles an hour, I am assuming normal conditions of track, and not everything in good order; it is hardly ever in first class order, nor is the engine ever in first class order. If everything is in perfect order, there is no impact. If there were no imperfection in counterbalancing, no deflection of the bridge, if the ties were long enough, if there were no flat wheels, no low joints and the track was well maintained, there would be practically no impact. The roadbed of a railway is elastic—more so than a bridge.

I have never in any other case testified to rules for the division of costs. In Oklahoma and Texas cases, previously described, and to be begun, the division of costs were not made on the equivalent ton mile ratio. In those cases, they are trying to divide the costs by several alternative methods, applying the different methods to the subject as a whole; one of their bases is the speed ton miles, taking

the weight of the train and multiplying it by the speed between stations; also the revenue train miles; also cost accounting; also gross ton miles; it being the purpose to show the results by each method.

In Minnesota Rate Case, where I testified, I applied, as a proper cost for legal expenses, $50 per mile of line. For organization, administration and general expenses, I applied $100 per mile of line. In Minnesota Rate Case, I fixed 30¢ per cubic yard for earth work grading, and testified that 10¢ of that price was added as contractor's profit; 20¢ was the contractor's price, and 10¢ was added for contractor's profit; I fixed for solid rock $1.10 per cubic yard,
1421 and 10¢ of that price was added for contractor's profit. For interest during construction, I made a deduction of 2% of the interest rate, due to earnings from partial operation.

In my testimony in this case, I had before me a list of the questions. Questions that were asked me were substantially in my hands as a list of questions, and I had memoranda on the margin of my thoughts in regard to the matter; I arrived in Marquette on the 8th, at 5 o'clock, and have been here to present time (16th).

The trip over the line consumed less than four days. From the time I arrived in Marquette, I have been in conference with Mr. Eldredge; at various conferences, Messrs. Tracy and Cotton, and, for 15 minutes, Lindsey, were present.

I would not use the method brought forth by Mr. Lindsey, because I know of a better plan. I would not say that I would approve of it if I did not know of a better plan, because I would have to carefully consider its merits; it would require a very careful investigation on my part. There are several others I think better. I have not passed any opinion on whether Mr. Lindsey had the wrong formula. I heard his formula stated. I think the formula I gave for impact more correct. I should hesitate to use M. V. squared for impact formula on track before I had carefully gone into it. If I were to throw a ball against the wall, I would determine the impact against the wall by M. V. squared, modified, of course, to allow for the elasticity of the object thrown. If I were to roll a ball on the floor, after making the modification for elasticity, the impact on the wall would be measured by the M. V. squared, but the impact on the floor would not be measured by that formula.

The only curves I measured were those I listed, being 18
1422 in Michigan; different elevations on the same curve were taken at various points.

I reached the conclusion of a high degree of maintenance for South Shore. My investigation relates only to the period at which I made it, and is not expressive of any previous condition.

I was not told that the expenditures for maintenance went up very materially in 1913 over 1912, and in 1912 over previous years. I was furnished the figure for maintenance of way per mile for one year, of $896. I was informed that the average, for a period of five years, from 1908 to 1912, of expenditures for maintenance of way and structures was $892 per mile. I do not know what trackage that included. I did not ask what was treated as main line, but all reports are on the basis of considering double and triple track as main line.

I was not given a comparison of maintenance by division, and no figures to indicate actual rail replacements on curves.

Chart, Complt.'s Ex. 95, Berry, passenger train speeds, St. Ignace to Marquette, is based on running time consumed between two points without stops. If a freight train trip, St. Ignace to Marquette, were platted in the same way, it would show like waves as chart 95, but I don't think it would show as high speeds. I do not understand that the freight trains are allowed to run at that rate of speed. To determine the actual speed of a certain freight train at a certain point, it would be necessary to get the data for platting a similar curve.

If you took only elapsed time between stations, the heights of speed to which the freight train rose would not be shown. Assuming three times the tonnage in a freight train as in a passenger train, with the same type of locomotive, it would take it considerably longer to stop than a passenger train.

I do not know the number of curves, the average degree of curvature, or the average of elevation on the outer rail of all the
1423 curves of the South Shore; the proportion of curve to tangent is small. I think the largest number would be two degrees or less, and that there are more curves of two degrees or less than of any other degree. In order to tell the amount of track damage due to curve elevation, it would be necessary to have a history of each curve, including the degree of curvature and the elevation of the outer rail.

On curves, if there were no elevation, you would still have centrifugal force to overcome, and nosing of the trucks; it would be aggravated by having no elevation, if there was any speed to it. Even if the elevation were fitted to the needs of the train moving around the curve, the movement would cause more wear there than on tangent, the amount depending on degree of curvature; any degree of curvature involves more wear than on tangent.

On some portions of South Shore the joints were well maintained, and on others they were not; in general, they were well maintained. They were not so well maintained on the lighter, 60 pound, rail, west of Nestoria, laid in 1887 and 1888. The joints were out of surface on the Western Division, and loads passing over those joints cause vibration, increasing with speed. Where the joints were out of surface, there would be some vibration, even from a train moving 20 miles an hour; that vibration increases the expense of maintenance, in that it aggravates the condition so that it becomes necessary to restore it to good surface. This increases expense of maintenance on both roadway and equipment; the latter to a minor degree.

From a timber bridge on South Shore I would not hesitate to get 20% or 25% longer life if used exclusively for freight than if used for freight and passenger. Even for freight service, I would not permit a bridge to go below 50% condition; 50% would be a pretty low percentage for a bridge, even for freight service. When
1424 I said that if South Shore were engaged in freight service only I might save 25%, my percentage applied to all items appearing in maintenance of way and structures.

The purposes of ballast are for drainage, to give elasticity, to give better surface, and to permit the track to be gotten into line or surface more quickly. If you had only freight service, you would want your road so you could get it into condition as quickly and easily as possible; that would apply, whether you had passenger service or not, but in a less measure for exclusive freight. The track is not thrown out of line or surface by the slower freight train, as compared with the faster passenger train. With only freight service, I would take more chances on the track being soft than with freight and passenger.

I do not believe I can differentiate so carefully as to say which affects track maintenance the greater—tonnage or speed; they act together and affect it; one acts upon the other. It would be difficult to state what importance you would give to the tonnage or to the speed part of the combination, in exact figures. I know of no way of doing it by figures, and never heard of any one attempting it. (Witness asked whether he would disagree with other witnesses who had stated that the speed alone was not sufficient to overcome the excess wear of greater tonnage on the freight side.) I would not attempt to differentiate between the two. I am offering no criticism of their opinion.

I saw the gross ton miles, both passenger and freight, but those did not enter into my conclusions, except to be used as a matter of comparison between what results might be produced by several formulas.

Years ago, I conducted a series of tests for bridge deflection, but not with the fine instruments now used; of recent years, I have not personally conducted any of these experiments.

1425 I have made no tests of track to determine the effect of speed upon it. I know of the methods others used, but whether they produced accurate results, I do not know.

On South Shore, assuming only freight service, I think I would get an average life of 7 or 8 years for tamarack and hemlock ties; I think I could use them in more rotten condition for freight than passenger. On trip over South Shore, I noticed a good many ties cut by rail; the hemlock and tamarack ties were cut somewhat, but the cedar much more. I saw many hemlock ties taken up that for freight service alone could be worn longer; they could have been worn longer for either service. I got the number of tie renewals for the current calendar year, 1914. The number contracted for was 333,000 for the whole road, and 290,000 for Michigan. I figured that into the gross number of ties, to find the cycle of renewal. I took it that the South Shore had from 35% to 40% of its main track mileage and siding, and perhaps a little more, on account of its ore tracks, and, put together in that way, I thought the renewals per mile were fair.

I would apply the equivalent ton mile ratio to the division of weather costs.

On my basis of equivalent ton miles, I apply the same rule to weather as to mechanical wear costs; that depends on the volume of tonnage, and is varied by the volume of locomotive tonnage. For fences, the general weather costs and erosion do not decrease or increase faster or slower because of increased or decreased tonnage, nor in porportion in which the tonnage increases or decreases. There is

no basis, to my knowledge, upon which the weather costs can be divided which reflects anything that varies with the weather cost. I came here with the idea pretty well fixed in my mind that
1426 the equivalent ton mile basis was proper. Mr. Howard and I came here with no other desire than to give the best we had, and advise our clients of what that was. We both believe in the equated ton mileage, having investigated it thoroughly.

In applying the equivalent ton mile basis, the closer you get to the division in which the expenses occur, the more accurate the result becomes. By applying it by zones, you would get different results for the different zones. I don't think you could figure it down as fine as to take it by each mile. I am speaking of the difficulty of getting at the data. If we could get at it by each mile, we might get different results for each mile of the road. I doubt very much whether, in that way, you would get a different aggregate result from what we get by applying the rule in bulk, and I have never worked it out to see, and have never worked it out by divisions.

The mileage of all trackage engaged in common service or in exclusive freight service was not given me; I did not understand anything was exclusive freight trackage, except a short piece, Negaunee to Winthrop Junction. No statement and no percentage was given me of the amount of time of freight trains engaged in stational service, or of the proportion of switching mileage in freight and in passenger service. I made no analysis of terminals to determine the proportion of use in freight or in passenger service. I made no investigation to ascertain the gross tonnage of company freight, though there is a way of doing it. It was not given to me .

In saying that the element of flat wheels in freight is perhaps trivial, or unimportant, I had in mind the excess number of wheels in freight over passenger service; taking into consideration those excess wheels in freight service, there would be many more flat spots in freight service. Whatever damage they did cause, except that added to passenger by reason of excessive speed, would be greater in freight than in passenger.

1427 In my judgment, the expense of getting a passenger train by a freight train should all be charged to the passenger. It is necessary for each to pass the other. If there were no passenger train, or if there were no freight train, we would not have the expense; the expense is there because we have both services, and it is as necessary to get one by the other as the other by the one. It is unnecessary to make a sidetrack as long as the longest freight to get it by the passenger; you could pass with a passing track sufficient to accom-odate the passenger train. I meant to intimate that the train taking the siding should bear none of the expense due to the taking of the siding, but that it should all be charged to the other traffic, in that the freight train had already had charged to it a good share of the expense of handling it in and out.

In case of a freight train passing a freight train, the expense should be charged to the train occupying the main line, as a matter of bookkeeping. Independently of the length of the sidetrack, the passing of the two trains, freight and passenger, is a benefit to each service. The whole thing should be charged to the passenger, simply

because the movement has been made for the benefit of the passenger train; also, the freight train, in taking and staying on the side track, has expense all charged to freight service, so it seems to me that the expense of going in there should be properly charged to the passenger train.

The Master Car Builders' rules permit wearing of wheels so that the coning entirely disappears before the wheel is taken out of service. On our railroads, we have many freight car wheels without coning.

I should say critical speed was that at which the train produces the greatest effect. It is the point at which the maximum effect is reached and the line begins to fall the other way. Critical speed is not of necessity maximum speed, but varies with the character of the structure and the length of the span. The longer the span, the lower the critical speed. My understanding is that the critical speed is seldom below 25 miles an hour. I have made no tests to determine the point at which it occurs. On tests with which I am familiar, critical speed at 25 miles an hour was indicated, and there were some cases below.

1428

There is no impact, or perceptible impact, made on track in good condition, that is due to speed alone, if the locomotive is in good order and properly counterbalanced, with no flat spots on wheels; this applied to a bridge; I did not apply it to a track. The reason for the difference is that you can measure the impact on a bridge, but it is very difficult to measure it on track. I did not mean to answer that there would be no impact if all of these conditions existed on track, but that it has not been proven to be true. The ground, when not frozen, is more elastic than a bridge.

Ballast is put on bridges, to guard against fire, and to make a continuous roadbed, so you can use track ties and get the same effect on the bridge that you do on a track elsewhere. A ballast deck floor on a metal bridge is to avoid the shock that occurs where you leave the roadbed and strike the pavement. It operates to reduce the impact. Where a bridge is in proper shape and ballasted, impact is greatly reduced.

Q. And that same reasoning could be applied to track, could it not, on the ground that, where it is well ballasted and the joints are well surfaced, the train conditions are such as to minimize the inequalities of flat spots and of imperfect counterbalances, that the impact disappears there also?

A. Yes.

Q. Assuming a straight track——

A. Hold on a minute. You have made an exception there to the conditions of the engine, haven't you, and cars?

Q. No, I said that they should be in good condition?

A. Then the answer is yes, as I gave it.

1429

Q. Eliminating, as much as possible, the impact from defects in the equipment?

A. That is all right.

Q. Assuming straight track, well maintained and in good condition, and eliminating all questions of curves, unbalanced drivers, depressed flat joints and flat or eccentric wheels, is it not true that

the higher rates of speed, say 40 miles and above, are less damage to track than lower speeds, say those below 40 miles per hour?

A. No sir.

Q. You wouldn't apply the same principles that you apply to a bridge there?

A. No sir.

Q. If not, where is the damage due to speed?

A. Because every time that engine, even with things in perfect condition, as you speak of, strikes the joints of the rail in the track, it has a tendency to drive that down that doesn't exist on a bridge at all; and, the higher the rate of speed, the more it hammers those joints down, which it can do on track and connot *due* on a bridge.

Q. Is that because you cannot have perfect counterbalancing?

A. No.

Q. And cannot have perfect wheels?

A. It is because on a bridge you have got something that will not depress.

Q. The reason it occurs on joints is because you cannot have perfect counterbalancing.

1430 A. No sir, it is simply because a joint is the weakest point in a track, and it is subject to being pounded down more than any other portion of the rail.

Q. But, other than the joints, there would be less damaging effect?

A. Oh, yes; you would at other points, on account of the ballast continually varying from day to day its condition by the wind, by water, by something of that kind, reduce the value of the support.

Sufficient ballast, good ties and rail, and proper expenditure for roadway and track, producing fairly even track and good track condition, operates to reduce the expense for maintenance of roadway and equipment due to low track joints and imperfect track, and to reduce impact thereby.

The Master: You would say it is better economy to keep a track in that condition than it is to get it in any poorer condition?

A. I would like to answer that in a Yankee fashion, if the Master doesn't object: They tell me that a fellow once said that he could buy the whole of Chicago for a dollar, but he didn't have a dollar. We sometimes regulate the good condition of our track by the size of our pocketbook. I know that has been the thing that has been pounded into me for a good many years.

The Master: In the instance which Mr. Wykes described, if you say yes to that, would it follow, from that, that it is more economical to keep the track in that condition than it is to keep it up in poorer condition?

A. I think so, too; I agree with you in that. I had a great deal rather have the money to keep it in fine shape all the time, taking into consideration the traffic that it is to carry; that is the economical way to do it, too.

1431 After we have applied these formulæ, we do not know how close to the truth we are, and there is no measure for telling, except comparatively. If on one road you have the figures for the revenue train mile, and use one or two other farmulas, taking into

consideration the elements you think are right, and they agree reasonably closely, I should say the formula that had the elements that cause mechanical wear is proper. The evolution of these formulæ from time to time depends upon judgment. That evolution has not proceeded to a point where we can say there is a consensus of opinion for the equivalent ton mile formula, or for any other, except that students of economics have been gradually sifting out those which they thought had no merit, and new ones have been springing up from time to time. One expert or railroad man selects one, and another selects another. As to whether each urges the one he is for with equal confidence, something else comes in there; some of these formulæ are selected by men who do not know what they are talking about. There are men, whose opinions I respect, who differ on the proper formula to be applied. The formula to be applied involves the judgment of the person applying it. That judgment goes to the question of whether it represents the propert elements on each side of the problem.

I think the revenue train mile basis has been more generally used, for some time back, than any other that I know of. The only bad feature about that is speed, and the locomotive; they have been trying to remedy that, in a recent formula, by using speed ton miles, but that does not cover the question of differences in locomotive effect. Everybody concedes that the effect of the locomotive on track is harder than the same tonnage of either freight or passenger cars. The revenue train mile basis also has the effect that it does not take into consideration tonnage. This is an easy formula to apply, which is one of the reasons for its repeated use.

1432 A passenger locomotive will do more than the same tonnage of passenger cars, and a freight locomotive will do more damage than the same tonnage of freight cars. We put the locomotives on an equated tonnage.

Every contract I have ever known between two railroad companies for trackage rights of one on the other has called the locomotive engine equal to two or three passenger cars, or three or four freight cars, in destructive effect.

(Stipulation that either party and the Court may use article from volume 12, part 3, proceedings of 12th Annual Convention of American Railway Engineering and Maintenance of Way Association.)

BERRY.

Redirect examination.

By Mr. Cotton:

Testimony has not been taken in the Oklahoma and Arkansas cases I referred to. A 50% value in bridges and trestles is not the same as 50% efficiency. A 50% value might be 80% efficiency. A 50% value represents the half way point between a new bridge and the scrap heap; it measures the time before you must put in a new bridge. A 50% value might represent a bridge you were going to

take out tomorrow, though that is an exaggerated statement, but the efficiency is not the value or a measure of the value, because efficiency is the safe bridge that will carry traffic without regard to value.

In my answers to State counsel's question, I understood him to ask me as to 50% of value. What Riggs said in his exhibit meant value, and had nothing to do with efficiency. When I answered counsel's question as to how long I would maintain or keep a bridge in 50% or 60% of condition, I had in mind efficiency.

1433 In my comparison, where I said the seven items or elements would represent 60% to 75% as much as the 25 items of the so-called Thompson alphabet, they being treated as 100%, I considered the sleepers and diners. I took Thompson's own estimate of that, as I now remember—$112,000 for transportation and $55,000 for operation, equalling $167,000. I had in mind, in addition to the value of those cars, that, if they were to be considered as a part of it, there was the interest on the investment.

BERRY.

Recross-examination.

By Mr. Wykes:

The several questions asked me on rebuttal were the subject of a conference between myself and the attorneys for plaintiff since my testimony this morning. Mr. Eldredge tried to indicate wherein I was wrong, and I explained to him wherein I was wrong.

1434 On July 17, 1914.

CHARLES P. HOWARD, a witness called by plaintiff.

Direct examination.

By Mr. Cotton:

I am 47 years of age. I live at Chicago; am a Consulting Civil Engineer. I have had about 30 years' experience in engineering.

I served for two years as a rodman, on construction, on Southern Railroad; one year as Assistant Resident Engineer of construction on Frisco lines; about a year as a levelman on surveying party; four or five years as Resident Engineer of construction on the Georgia, Carolina & Northern and Chesapeake & Ohio, involving construction of a bridge across Broad river, South Carolina, and Savannah river between South Carolina and Georgia. On Chesapeake & Ohio, I had charge of double track construction, as Resident Engineer; previously I was a resident engineer on the Nashville, Chattanooga & St. Louis, near Jackson, Tennessee. I laid 55 miles of track on that line, and maintained it until turned over to operating department.

I was chief of a party of the Darien Surveys of the Isthmian Canal Commission, surveys in the province of Darien, a hundred miles

east of the present Panama Canal. I was in the mining engineering business in West Virginia, making surveys and construction of inclines, tipples, etc. I was in charge of all engineering work and construction on the Deep Water Railway, as Assistant Engineer, in West Virginia, and the Tidewater Railway, as Engineer, in Virginia, about three years. On both these two railroads, we located a line from coal fields of West Virginia to Norfolk, had many locating parties at work, and constructed a good deal of the line in West Virginia.

I was Consulting Engineer at Pittsburgh. I made a joint report and reconnaisance with Mr. Kennedy, Consulting Engineer of the Wabash, on a proposed line, Wheeling, W. Va., to Connellsville, Pa.; and made a survey for the Wabash, contemplating a new
1435 entrance at Pittsburgh. I made a report on a proposed inter-urban railway, south of Pittsburgh. I was employed by the Lake Shore & Michigan Southern, for about three years, in charge of location, as Assistant Engineer of construction. After that, I was employed by the Illinois Central Railroad.

While on the Lake Shore, I was sole arbitrator of the value of 22 miles of the Pennsylvania Railroad east of Brookville, Pa., for joint operation. I made valuations for Lake Shore of short portions of the Baltimore & Ohio and Pennsylvania, which contemplated common use.

I was employed on reconnaisance and location of the Bangor & Aroostook Railroad, in Maine, and, later on, experience with Illinois Central, mentioned, as Locating Engineer for a line in Indiana and a line extending east from Jackson, Miss. I also made investigations into the economics of proposed grade and line changes on several divisions, two on the Illinois Central. I have since been occupied as a Consulting Engineer at Chicago, in which I have been engaged on one or two problems involving construction. I have had occasion to make special study of economics of railway location, for the last ten years.

I am a member of the American Society of Civil Engineers, Chicago Railway Engineering Assn., the Western Society of Engineers, Chicago Engineers Club, and, in the American Railway Engineering Assn., for a good many years I have been a member, and am now Vice Chairman, of the Committee of Economics of Railway Location. I am chairman of sub-committee number 2 of that committee, which is charged with the study of railway operation. I am also a member of another sub-committee, which is charged with the study of power of locomotive, with special reference to the improved efficiency due to the locomotive super-heater and the automatic stoker, and in other revisions of the Manual as to the power which
1436 may be deemed necessary.

I have contributed quite a number of articles to engineering magazines. I contributed an article to the Engineering News some years ago, tables and data for railway locating engineers, which has since been republished in pamphlet form; I have also contributed articles to the American Society of Civil Engineers on subject of location, and, in recent years especially, on subjects of valu-

ation. I wrote an article on curvature for the American Railway Engineering Association; I recently published a bulletin on Grade Reduction problems, and have written other articles for magazines.

I have, necessarily, had to give a good deal of attention to matters of track construction, and I have had to maintain track during the most trying period, immediately after it was laid, until it could be turned over to the construction department, and I have had to be constantly in touch with the maintenance of way departments at various times, constantly on and about the tracks of the railway, and, in connection with the Association, have also made special studies as to operating expenses, and, of recent years especially, in regard to the question of locomotive fuel consumption, speed, time, curvature, and divisions of maintenance of way expenses, which is one of the most difficult.

I have given special study to matters affecting railway operation, its effect on track, roadbed and track structures, bridges, trestles and other structures, the cost of such operation, and the amount and causes of expenses incurred in the different kinds of business conducted by railways, especially in the items enumerated, and, in a general way, as to the total expense of operation, so as to be able to correctly prophesy what the cost of operation would be on a new line.

I have never been a witness in a rate case, in litigation involving railway valuations or the cost of maintaining tracks and railway properties, or the cost of different tracks, or for any other
1437 purpose.

I heard Mr. Berry's testimony and his description of the trip over this railroad, referring to its physical condition and the inspection of track, curves, super-elevation, etc. Mr. Berry and I were together during those four days. I participated in all of the examinations referred to by him and assisted in measuring the curves and taking the passenger train time, St. Ignace to Marquette.

We found no outer rail elevation of 8 inches. We selected the curves and examined them from the profile, having in mind the sharpest curves, where we would expect to find the most elevation. We looked for curves of the highest elevation, and, had there been any of 8 inches, we would have found it. The results for curves and speed, as given by Mr. Berry, I would testify to as correct. I think the South Shore track, roadway and structures are in fair shape for the traffic it has.

(It was stated to witness that average speeds were, freight 16 miles, and passenger 27 miles, per hour, that passenger trains frequently, for shorter or longer distances, make 35 to 55, and occasionally, but infrequently, to 63 miles per hour, and that freight trains make occasionally, but infrequently, 25 to 35 miles per hour. He was then asked which service, per unit of weight, involves the greatest expense of maintenance of track, roadbed, and structures, both on curves and tangents, due to mechanical wear.) The greatest part of the mechanical wear, per ton, would be from the passenger trains, in my opinion, on account of the speed and the re-

quirements for better maintenance for passenger service. Generally, passenger service fixes the standard of maintenance, upkeep and efficiency. The effect on track is greater at greater speeds; as the track is never in perfect surface, and at high speeds the track blows are increased, it tends to have a worse effect on the track.

On the curves, we found considerable wear, at places, the wear being on both rails. That indicates that the wear on curves is considerably greater than on tangent; I noticed no special wear
1438 on tangents, except where I think rail had been taken from curves and put into tangent. We examined the rail, particularly on curves; I don't recall any particular examination on tangents.

If South Shore were used solely for freight traffic, I don't think it would have to be kept up as well as for both services, and it could be kept at a considerably lower standard. As to whether or not it is advisable to do that, there might be some difference; nobody knows exactly; but it is necessary for the passenger trains. The expense of maintaining it, if the passenger service were left out, would, in my judgment, be largely cut down. I could estimate that amount on equivalent ton mile basis; on that basis, if there were no passenger service on South Shore, the cost or expenses of maintenance of way, where the cost arises from mechanical wear, would be about one-half what it is now.

I read Mr. Thompson's testimony regarding the division of expenses of maintenance of way and structures resulting from mechanical wear between passenger and freight on Ratio 1, gross ton mile basis, and am familiar with it. I do not think such a ratio is proper or approximately accurate to be used in this case to divide common expenses, as it neglects the element of speed and the fact that higher speed passenger trains require better track, which are the reasons the equivalent ton mile formula was devised. That formula multiplies the passenger locomotive by four, the load back of it by two, the freight locomotive by two, and the load back of it by one, and the resulting quantities in each service produce the equivalent ton basis for the equivalent ton mile ratio. In my judgment, that ratio or basis is reasonably accurate for the division of expenses resulting from mechanical wear to way and structures.

1439 I have read Mr. Thompson's testimony respecting his Ratio 4, time, as a proper factor for the division of maintenance of way and structures expenses due to weather stress, decay or erosion. The same, in my judgment, is not proper or approximately accurate for this case, as the respective classes of trains occupy and require the reservations for their use of different stretches of track; and, if you take the larger portion of track occupied in that sense by the passenger trains and multiply them by it, you would get essentially different results from Mr. Thompson's, provided time theory were correct on any basis.

(Objection to strike out witness' answer because predicated on misunderstanding of Thompson's testimony, as Thompson does allow

for a suitable amount of track in his judgment, as required for the needs of the trains.)

If the passenger trains were slowed to the freight train speeds, with the same rights as now, they would still occupy the track in a more intensive way; they would then average the same use, in point of time, as the freight trains. I think Mr. Thompson referred to a section or block as being used by a train, and assumes that the same length of track was used by each train, passenger and freight.

I would not consider Thompson's Ratio 4 as proper or accurate for dividing maintenance of way and structures expenses beteween passenger and freight. I never heard of it before as a ratio for dividing expenses. I do not consider Thompson's Ratio 4 proper for use in dividing unallocatable property between passenger and freight services, for reasons already stated. That would not be accurate, even assuming his time basis correct in principle.

I do not know which would the more nearly accurately measure the division of common unallocatable expenses of maintenance of way and structures on this road, as between passenger and freight, the revenue train miles on the one side, or the gross ton mile and the time on the other side. I have never given any particular attention to the division of wear stress on railroads, for the reason that I have divided mechanical wear on equivalent ton miles and the weather stress according to the miles—so much per mile. I had no reason to divide between passenger and freight, and the only reason for doing that was to take into consideration the extra weight and speed, as to its effect on track. The equivalent ton mile basis I would use for dividing mechanical wear expense of maintenance of way and structures.

1440

Locomotives cause greater destructive effect on track, bridges and trestles, and passenger locomotives at higher speed cause greater destructive effect on track and track structures than freight locomotives at slow speed, if they are anywhere near the same weight. I have never observed the side motion of locomotives at slow speed, with heavy loads, causing stress on track and track structures, but if it exists, as it may, I do not think it important, as the blow would depend very much on the speed of application, and, as already mentioned in this case, all the cars behind the train would be going at slowest possible speed. In my opinion, the counterbalance on the locomotive is one of the most important features of damage, both to track and bridges; that is very important at high speeds. Thompson has not taken into account this higher speed effect on imperfect counterbalancing; I never heard of perfect counterbalancing, and my information is it cannot be done. Counterbalancing for a certain speed may be approximately correct, but, when you go beyond that speed, the unbalanced force becomes very destructive.

The causes of depreciation are wear, decay, obsolescence and inadequacy.

1441

It is the consensus of opinion among civil engineers that speed increases stress and wear, and requires for track and

track structures greater strength, stability and fitness, other things remaining the same.

A rail has an elastic element; every element has an elastic limit. But, in general, you don't speak of the elastic limit of a track being reached; at least, I don't think it is ever used in that way. He (Thompson) might mean that, when a track got dangerous, of course, it doesn't make any particular difference, the exact terms you use, provided you get the sense.

(Witness' attention called to quotation from Buhl case, where it was said that Woodlock and others held that that part of the cost of maintenance depending on traffic should be apportioned between different departments of the service based on locomotive mileage, switching included, and that many others held that the locomotive mileage alone is responsible for at least one-half the wear and tear of track, with which Thompson disagreed, and his judgment was asked about the paragraph.) Nobody knows exactly how much greater the locomotive effect is; as a matter of fact, it would vary with different locomotives and cars. But, it must be remembered that, when Wellington wrote that, both locomotives and cars were considerably lighter than now.

In the equivalent ton mile formula, the locomotive has been given double the weight, as being as near an approximation as we could get with our present knowledge of the subject. I have recently had sent me an elaborate blue print, in an effort to divide costs, which took a locomotive as weighing three times as much as the load behind it, but it is not possible, at this time, to make very narrow distinctions, and, of course, by assuming the locomotive as more than twice the equivalent of a given weight of cars, it would accentuate the difference between that and the gross ton mile formula.

1442 Wellington's book, which contained the statement quoted by Thompson, was written 25 years ago, and the last revision was 10 or 15 years ago. The statement of Thompson, that the critical speed is the speed at which the injury begins to decrease, is true. There is nothing in Thompson's statement that "in the case of very high speed trains, the injury to the rail joint is less than in the case of lower speed trains."

If the track were absolutely straight and level, and smooth, and there were no irregularities whatever, and if the locomotive and the cars had no unbalanced portion, so that there would be a smooth, uniform speed, just as if a perfectly adjusted machine were gliding on greased rails, why then, as I understand it, both by tests and by theory, there would be no jolt or jar, whatever, and there would be no effect of impact, going on a bridge. There would be just that due to the absolute weight; but, as a matter of fact, that is never attained under any conditions. In bridges, it can be attained, to a certain extent, where the track is good, and especially where they have a slight camber or bend in the track, so that, when a train gets on it, its weight presses that down and makes it more nearly level; that can be attained, to a certain extent, but the effect on track, of course, is a question of irregularities and blows, occasioned, not only by the roughness in the track, but by the counterbalance in the locomotive,

and blows of the wheels of the cars on these different low and high spots. One of the common track defects is low joints, and practically every track has some low joints.

On a single bridge span of 150 feet, a passenger train at 27 miles an hour would cause greater cumulative vibration and greater impact than a freight train at 16 miles an hour. A passenger engine might reach the critical speed at 40 miles per hour; a freight train could not by any possibility reach the critical speed. The impacts due to counterbalancing are practically none, up to 12 miles an hour, and very low for speeds of 16 miles.

1443 I have already given you the fact that the jar produced by a heavy freight car was not very great under about 40 miles per hour.

HOWARD.

Cross-examination.

By Mr. Wykes:

I am practically a partner of Mr. Berry's. I heard practically all his testimony. I am familiar with practically all of it. Mr. Berry testified to some things I do not know about. I have no specific criticism of Mr. Berry's testimony upon the subjects regarding which he testified. The information received by Mr. Berry and myself from company officials was received together, usually, so I had the same information he had. I asked questions whenever I thought it useful. Anybody that could tell me anything, I asked them questions which I thought pertinent to the inquiry.

I think you could cut the expense on the South Shore by taking off the passenger service. To say what expense would be left would be a guess, and involve my making an estimate on the whole cost of operation in each service. I do not know whether it would be 5% or 50%, and it would be simply a guess; it would be as much so as for me to give you my idea as to the relative expense of all the passenger and freight service on this line.

Limited to the expenses of maintenance, I do not really know; it is just simply a wild guess. I would have to guess on the basis of train miles; the mechanical wear portion that I have examined would be too small a proportion of the service. It would be the merest hearsay, based on statistics of what different roads cost per mile for freight and passenger, and they do not give those statistics. Sometimes I have taken the average cost per mile on a railroad as representing something like the ratio, and again I have taken it higher for freight service.

1444 Our examination of South Shore related solely to 1914 and the conditions at that time, and not to any previous time. I do not know the condition of the property in previous years, and did not investigate the expenditures of 1913 and previous years. The extent of perfection in which a railroad would be maintained would depend upon the speeds made. If, in a particular year or through a series of years, the expense went up very much above the average of

previous years, one reason might be that speeds had increased, or another might be increase in tonnage, prices or increased expenditures. If the speeds were increased materially, I think it would show an increase in cost of maintenance.

Bridges are usually designed for tonnage. If I were building a railroad today, and providing for new bridges, I would take into consideration the needs of 20 years in advance, providing for the prevailing type of locomotives, and also for changes in weight and conditions of locomotives, as indicated by practice of other important roads. I understand the South Shore's new bridges are Cooper's E 50 loading, which, it is maintained by some, are good enough for any locomotive that is likely to occur; it will take care of the stresses that the future gives evidence of. I believe the greater number of steel bridges have been taken out because of increase in loading. I examined but one wooden bridge particularly.

I know nothing about the annual expenditures of the South Shore on its bridges. I saw one figure of the annual expenses in one year, but could not say whether it was $1,500,000 or $2,500,000. I know nothing about the expenditures of the South Shore for bridges that would be due to speed, or the part due to passenger traffic. If it were a question between speed of 35 and of 60 and 65 miles an hour, I think you could cut in half the allowance for impact, and that allowance for impact would cut the live load on which you would base the weight of a bridge about 23%, and that would mean a
1445 saving in cost of 10% or 15% on a steel structure, because the weight could be made less if you were certain that those speeds would not be exceeded.

I did not mean that I would favor building bridges for exactly that traffic, for people might want to own a road, good not only for immediate purposes, and which they could dispose of. Assuming we were going to devote the South Shore exclusively to freight business, and I was called upon to replace these wooden trestles and provide for the needs of today, and for a good railroading and the needs of the future, I would put in E 50 bridges, which is a good bridge and good practice. That is South Shore standard.

It was not indicated to me what amount the South Shore was spending for ballasting or ties; I do not know what the expenditures for ties or track laying or surfacing for the past 5 or any one of the past 5 years has been.

I saw equivalent ton mile formula before it came out in American Society report, as I was a member of the committee formulating it. I don't think it had been studied more than a year previous to the report; that is, I do not think there had been any specific study applied to make any formula, unless it might have been in the minds of some of the members of the committee before that time. The members' experience extended over the time of their acquaintance with railroads. I think these tests made for bridges apply, in a great measure, to track; I don't know of those being considered by anybody. I did not consider them in my work on the formula.

I do not know what particular railroad is mentioned in the report; I do not believe I signed it, but I was a party, and agreed, to it. The

association has not adopted it. I do not know that any railroad has adopted it, or of its use in any rate case. It was up for discussion before the Association. When a report is presented in an an-
1446 nual convention, they generally discuss it; generally, they do not adopt a whole report, but, if they see fit, they adopt general conclusions. The conclusion presented in the report of the committee may be adopted, or it may be modified and adopted. I think there was a motion to adopt the equivalent ton mile formula. The question came before the Association as to whether it should be adopted or not, and they didn't adopt it. I think Mr. Lindsey participated in the discussion, and was against the adoption of the formula.

Where I applied it, I was not interested in what the division between passenger and freight expenses was. I never used the equivalent ton mile ratio for weather stress items. I would not approve of it for weather stress items, unless I had investigated to see some reason why it would apply. It was intended to take care of that. I did not approve of it for the division of property between the two services.

I cannot tell you which character of depreciation is the most important, wear, decay, obsolescence or inadequacy. The depreciation due to inadequacy would, I think, in some respects, be very considerable; e. g., wooden bridges, ballast and steel bridges. In general, the life of a wooden bridge or trestle is 8 to 10 years, depending on the climate and the timber used.

The term "critical speed" is not applied to track. Track, you might say, is composed of a number of short spans, 2 to 4 feet apart; if the critical speed is not reached on spans of 50 or 70 feet, it would not be reached on spans of 2 to 4 feet. I believe, in general, the critical speed on track is when the locomotive jumps the track.

I know of no way of measuring the effect of speed on track, except the tests of the recent report of impact on bridges, and I think that largely applies to track. The counterbalance of the loco-
1447 motives produces an effect which increases with speed, and, as I told you sometime ago, the two locomotives in that report (American Railway Engineering Association, upon equivalent ton mile formula) show about 60% increase in the static load, due to dynamic augment. With the variety of different kinds and types of locomotives, and of different weights of cars and loads, it is difficult to say what effect should be attributed to speed and tonnage. I think, possibly, the ranges within which it would fall could be obtained. At speeds below 10, 12 or 15 miles an hour, the speed would cut little figure; I do not know how much; I know no way of calculating it. I think it is largely the result of experience and judgment based on experience. The amount of damage done by speed depends on the conditions of perfection of track.

The conditions of counterbalancing and the method of construction of equipment all enter into it, as well as the intention to have the equipment in good order, the amount of flat spots, and many kindred items. If everything were in ideal condition, and there were perfect surface and no low joints, you could get rid of that locomotive counterbalancing, and there would not be any danger. If

everything was in ideal condition, there would not be any impact from speed alone, except on grades and curves. Theoretically, there would be no increase in weight due to the dynamic augment. One of the reasons you can never get those ideal conditions is because there is always some give in a track and the ballast is never perfect. One purpose of the ballast is to evenly distribute the weight, and that is the reason why on high speed railroads you put in more ballast and put your track in better condition, and try to approach ideal conditions. It takes money to keep it up.

I did not consider the results of much value, because the amount of ballasting in the statistical figures would vary from year to year.

1448 The ballasting would fluctuate with the conditions of the ground, and the comparison was based upon expenditures, with nothing to indicate the character of ballast or the costs of different kinds of ballast, which vary.

I do not know how closely the equivalent ton mile basis would come to expressing actual conditions. My judgment is that it is a fairly accurate measure,—the most accurate that I know of,—but I do not know the limits of accuracy or error, and I do not know any one who does. The equivalent ton mile basis was recommended by the committee for general application; I do not remember any exceptions. I would apply it to the South Shore, but don't know as I would apply it to the New York Central.

I have a statement here, taken from Mr. Thompson's report, giving the locomotive weights in both services. The only way I could get the ton mile average would be to divide by the train miles. I did not do that, either for passenger or freight; that would not affect the formula, because the total weights would be multiplied by the same thing.

HOWARD.

Redirect examination.

By Mr. Cotton:

I do not know whether the equivalent ton mile formula was rejected by the Association, or that it was referred back to the committee; the committee this year is charged and directed to investigate the subject.

HOWARD.

Recross-examination.

By Mr. Wykes:

I do not know whether the committee is especially considering the equivalent ton mile formula now or not; it is considering all the information it can get on the subject, and, if the information

1449 checks that formula, it would be the formula selected. The general investigation is to determine the relative cost of passenger service, as it affects maintenance of way expenses. The report may not be a formula; it might be a method.

1450 On July 20, 1914.

WAYLAND W. WALKER, a witness called by plaintiff.

Direct examination.

By Mr. Cotton:

I am 46 years of age. I live at Duluth, and am Vice President and General Manager of plaintiff, having exclusive charge of the departments of operation, traffic, maintenance, and construction. I have been connected with plaintiff since 1890, (1900) as Traveling, Assistant General, and General, Freight Agent, and as Vice President and General Manager, having during that time given my time and attention exclusively to its service and its railroad. Have been Vice President and General Manager since December 1, 1911, since which time all construction, operation, maintenance and traffic has been under my direction. I have been in railroad business 30 years; with Grand Trunk, Great Northern, and Sioux City & Northern, up to 1900.

In my judgment it costs South Shore 20% to 30% more to keep its railroad in condition to operate passenger trains over it than it would if we operated freight trains exclusively, as we must provide for better track in all features, such as ties, rails, ballast and alignment, to provide for faster time of trains necessary for passenger traffic. If we had only our present freight traffic and service to maintain, the operating expenses would be between 20% and 30% less—nearer 30% than 20%.

The South Shore water front at Houghton has been used in the past and is now usable. It is necessary for the uses of the company, taking into account the possibilities of immediate use and the future; we hope to be able to use it soon. We expect to get in people to handle stone over it from quarries on Portage Lake; negotiations are now pending. I consider this water front very necessary, and wouldn't want to sell it. In the past, it has been used for handling trap rock from the mines, used in crib work for the canals, largely; part of the trestle is left on it.

1451 South Shore has had sleepers all the time I have been here. Diners were put on after I came; before then, meals were served at lunch counters, at different points, and by Wagner cars. It was then the practice to stop the trains to permit passengers to eat. We have had diners about 15 years. Sleeper and diner services are, in my judgment, a necessary part of passenger service; the people have come to regard those as a necessity, and the railroad not furnishing them cannot expect to enjoy traffic, except between points where people have to travel over that railroad. The people in Michigan use the sleepers and diners largely. I would say they are necessary for passenger service wholly in Michigan and serious loss of business would result from abandoning them—I should say 50 per cent.

People travel because of the facilities they find; passenger business has been built up largely on that service. An example is the

considerable traffic we have between Copper Country and Lower Peninsula, and that, Houghton to Chicago, of solid steel passenger trains with diners. If we did not furnish sleeping and dining accommodations, via Mackinaw, we couldn't expect any first class business. The Copper Country situation is governed by competition with the Copper Range and C. M. & St. P. On business between Soo and points east, and Duluth and points west, we couldn't expect any first class business if we took off sleepers and diners. No doubt, the same would be true as to business between Detroit and Houghton and other points, and Marquette and others, in Michigan; we would lose a big percentage of that business. That would be true for passengers whose destination was points in Upper Peninsula.

The passenger rates and business are competitive in the whole state of Michigan. From Duluth, we have competition to every point of importance on our railroad. Through service by boat increases in efficiency every year; they are active competitors for all our business from Duluth to water points, and also to our short points out of these water points; e. g., boats leaving
1452 Duluth, stopping at Houghton, carry many passengers for such points as Baraga, L'Anse, and places where the boats don't touch. Many people go from Duluth to Marquette and use our short roads to Ishpeming and Negaunee and other centers of importance. Marquette is competitive with water and also with the all rail lines from Chicago. The line, Duluth to Soo, is competitive, not only with water, but with the Soo Line, whose railroad is from Duluth to Soo, on which they make as good time as ours. We are subject to water competition five or six months of the year. These competitive conditions apply in a more exaggerated way for freight, as the boat lines do freight business for about eight months.

Every community of any size on the railroad is either located on, or competitive by, water. The same is true of other communities in respect of rail lines. Between Duluth and Soo, our line is crossed by 16 railroads. That is nearly always a disadvantage, as we are forced to surrender our business on the short haul very often, where we could get a long haul if the railroad were not so near. We get a benefit in return for that in some cases, but it is negligible. I don't think any railroad can get any rate they want; other elements than competition enter in.

Ore is our heaviest commodity, 5-year average being 41.7% of the tonnage. This is competitive with other lines; some ore goes to Newberry, but this is competitive in the sense that that furnace must have a corresponding rate with furnaces located elsewhere, to enable them to sell at a profit.

Stone, sand and other line commodities produced 9.36 per cent of the tonnage in 1913; it consists nearly all of limestone from Fiborn, Michigan. This is sold at Soo, Ont., Duluth, Superior, and the Copper Country, and the rate is governed entirely by the commercial competition of other limestone producing points. This exists in Michigan, principally at Alpena, where U. S. Steel cor-
1453 poration receives great quantities of limestone. We have tried to increase this rate, but it seems, if we did increase, it would result in shutting down the property.

Grain and flour produce 2.91% of the tonnage; they originate at Minnesota and Wisconsin points, seeking a market east, via Soo and Mackinaw, making it competitive with the lines through Chicago, Milwaukee and Manistique. We are no factors in the making of these rates; the basis is really established by water competition. An arbitrary rate above the water rate basis is made by the conference of lines. On grain and flour to Iron and Copper Country, we are subject to competition both by rail and water.

Bituminous coal, 6.18% of our tonnage, is largely handled through Marquette to mines about Ishpeming and Negaunee; the rates are made to compete with shipments through Escanaba and Gladstone. An advance cannot be secured, unless an advance is made from the ports mentioned. This coal originates outside Michigan, is under I. C. C. jurisdiction, and we can get no advance on that or other rates except by its consent.

Iron, 1.39% of our tonnage, is largely pig iron from Newberry, and rates are produced by commercial competitive conditions, and, to allow the furnace to operate, it is necessary to make very low rates.

Rates on other commodities making up the balance of our tonnage consist of tonnage destined to such points as Soo, Marquette, Ishpeming, Negaunee, Houghton, and points north, Duluth and Superior; these are highly competitive with rail and water rates, the rates from Mackinaw City and Soo to Duluth being the maximum that can be exacted from intermediate points. These rates are produced by the lines operating through Chicago to the head of the lakes, and this railroad cannot advance them except when a uniform advance is made by all lines involved.

1454 On copper, we enjoy the haul only during closed season; when navigation is open, it all goes by boat, the rates for which are one-half ours.

Our natural resources are minerals and forest products. Other railroads reach the mines from which we get ore, and a great deal of it goes by other lines. It is problematical whether we will keep that business or not. We get copper shipments for four months. For fiscal year 1913, lumber and forest products was 28.79% of our tonnage; that business is in competition by water and rail. The volume of forest products handled by our railroad has been increasing as the result of cleaning up the land. The white pine was first taken off; now they clean the land of every commodity, inferior timber and forest products necessarily making lower rate. Owners of timber along our line control railroad or water facilities; the Mather interests have railroads through Marquette County, and east to Evelyn, on our line, in which they are active competitors; the L. S. & I. is competitive, Ishpeming to Marquette, and the M. M. & S. E. east as far as Evelyn. There are the Mather lines.

The competition to which I have referred controls and fixes our freight rates on the systems and in Michigan; the competition of the north and south lines tapping our line at the different points establish a condition of rates on forest products that controls the rates from both local and competitive points on our railroad, particularly on lumber, as lumber rates are made on zone basis, and whether a mill is

located on our line or that of a competitor depends upon whether we give the same rate as the competitor.

The water rates affect lumber transportation to Chicago; we have established a rate of 2 cents per hundred pounds on lumber to Chicago less than we have from interior points, to meet this water competition, which will always be there. At the rates at which we carry, we have to make some profit, or we would stay out of the business.

1455 There has been some slight growth in agricultural products over our line. We have a 1% ruling grade, Duluth to Soo, which costs us 25% to 30%, in my judgment, more to operate than if we could reduce it to .5%.

The passenger traffic fixes the standard of maintenance and upkeep. I think our service compares very favorably with any of the railroads of which I have knowledge. Considering the extent of the traffic, I regard the passenger service as efficient and well maintained.

WALKER.

Cross-examination.

By Mr. Wykes:

The water front at east Houghton yard was used six or eight years ago. A trestle was built, which is, in part, still there; we are now considering having someone else use it. Since that time, there has been no use of the water front, in the shape of the use at that time, except that we expect to put some tracks over there; if the water is to be used, improvements must be made to fit the business; boats cannot land at our property without a trestle.

We consider dining car service necessary at all points where the journey covers the period of a meal hour; a good many (several) of our trains do not carry diners. I think the larger portion of them have diners; they are on 7 and 8, and on 1 and 2, which are big trains—our best trains. We have diners on both Chicago trains; we have diners, except west of Nestoria, on every train running any distance on our railroad. On the 14 trains between Ishpeming and Marquette only 1 and 2 have diners; these are through trains. West of Nestoria, we have two trains a day, each way, with a diner on one of them, Duluth to Bibon and return; there is no dining service in Michigan west of Nestoria. I should say trains carrying diners have a greater mileage than trains without; we haul a diner to Mar-

1456 quette, and are through serving at Newberry; we take diner to Marquette to go back next morning. Between Negaunee and Houghton we have four trains each way per day, and two trains each way taking dining cars.

Between Marquette and Soo we have two trains each way each day, both with diners, part of the distance; 1 and 2 have them Marquette to St. Ignace, and 7 and 8 Marquette to Soo. The mileage of trains on which diners are hauled is greater than that of those which haul no diners. I don't mean the diner mileage; we don't haul the diners the same distance that we haul the trains. The two

trains to Copper Country having diners are the St. Paul and Northwestern trains, and our 1 and 2.

At nearly all the 16 points where our road is intersected by other railroads, we transfer and receive freight, the volume of which is large; we are permitted, in that way, to reach points that we could not reach if it were not for those points of interchange, both in originating and delivering business. I have never made a computation to determine the proportion of business that we wouldn't reach or receive if we didn't have those interchange points. It is impossible to arrive at such computation, because of the fluctuation in traffic, commodities and conditions.

The South Shore line, Soo to Duluth, is 60 miles shorter than Soo Line mileage. Their running time of trains is pretty close to the same as ours; their ruling grade is .45%.

Escanaba and Gladstone to Ishpeming and Negaunee is 60 miles, as against 15 from Marquette to Ishpeming and Negaunee. Coal coming up that way has a considerably longer rail and shorter lake haul than coal coming via Marquette. Lake rates on coal to Escanaba are cheaper than to Marquette. Our coal rate is not made in
1457 combination with the water rate. I cannot give you the comparative rate, Gladstone and Escanaba with Ishpeming and Negaunee, and from Marquette to latter two.

I don't know proportion of South Shore's business between points local to its line. It would be quite a long computation to find it. I should say it was inconsiderable between strictly local points, except on logs to mills. I couldn't express it in a percentage, with any definiteness. By strictly local points, I mean that originating and delivered on the line. In saying that it was inconsiderable, I did not take into consideration that which arises on other roads in Upper Peninsula and is delivered to local points on this line. There is not a very considerable amount of business originating on South Shore and going to other railroads for Upper Peninsula delivery. I could not fix the proportion of that business.

Where you have the facility, train equipment, etc., you can add business without expecting the same return from it as if it were the first business of the road; that is the policy of all railroads. We try to make rates so as to make some profit on each commodity that we take.

WALKER.

Redirect examination.

By Mr. Cotton:

Trains 3 and 4, with C. & N. W. equipment, except mail and baggage cars, serve from Houghton to Ishpeming; they serve as South Shore trains from Ishpeming to Marquette; Northwestern diner on that train serves the Marquette and all intermediate business. The same is true of C. M. & St. P. Chicago trains 103 and 104, between Houghton and Champion.

(Stipulation that the latest maps of the Michigan and Wisconsin Railroad Commission may be referred to by either party with like effect as if in the record.) I don't think our line sells tickets
1458 in connection with the steamship lines between Duluth and Houghton, and Duluth and Marquette. (This witness was later called to testify before the Court.)

1459 On July 21, 1914.

RAY BROTHERTON, a witness called by plaintiff.

Direct examination.

By Mr. Tracy:

I live at Negaunee, and am Engineer in charge of Cleveland Cliffs Land Department. I prepared the following statement showing lots in Negaunee and Ishpeming, area in square feet, assessed value, and assessed value per acre, taking the areas from survey maps, and taking the assessed values from assessment roll; the figures are correct.

1460

Description.	Area in square feet.	Assessed value.	Assessed value per acre.
City of Negaunee.			
Iron Plat (or Pendill Plat):			
Lot 103	5,250	$600.00	$4,966.00
Lot 104	4,500	500.00	4,835.00
Lot 105	625	300.00	20,908.00
Lot 108	625	300.00	20,908.00
Lot 119	1,225	300.00	10,454.00
Lots 61, 62, 63 and 64	10,125	4,000.00	17,205.00
Maitland Addition:			
Lot 9, Block 2	5,400	500.00	3,920.00
Lot 10, Block 2	2,400	500.00	8,712.00
Lot 11, Block 2	3,250	300.00	3,920.00
Lot 12, Block 2	4,000	350.00	3,484.00
Lot 13, Block 2	4,650	400.00	3,736.00
Lot 14, Block 2	5,300	450.00	3,659.00
Lot 15, Block 2	5,950	600.00	4,356.00

City of Ishpeming.

Original Plat:

		Sale price, less building.	Sale price per acre.
Lot 86.....	3,500	7,000.00	87,120.00
Lots 133 to 136 inclusive...	16,100	12,000.00	32,234.40

1461 I figured the assessed value per acre, and the computations are correct. Lot 6 of Nelson's original plat is the property recently sold to Gately brothers, and lots 133 to 136 inclusive are the post office property. I got the sale prices on those descriptions from Mr. Tracy.

BROTHERTON.

Cross-examination.

By Mr. Wykes:

Lot 103 is a full lot; lots 104, 105, 108 and 119 are fractional, and belong to the Cleveland Cliffs. On lot 105, the railroad takes all of the lot except 625 feet. I have applied the assessed value of $300 to that 625 feet, and the same for other fractional lots.

We have known for several years that they were assessed as full lots, but have made no protest. There are right of way posts at the edge of the highway showing right of way line. Lots 61 to 63 are full, and 64 is a fractional lot. They are all vacant.

Lots in Maitland's Add. are 2,800 feet east of the depot and north of the old abandoned track. The Gately description, lot 86, had a structure on it at the time of sale, I think. It is the northeast corner of Main and Pearl. In getting the area, I figured the lot exclusive of streets. There is a street of 50 feet on one side and 60 on the other; the part exclusive of the streets is .08 of an acre; it is one of the good corners of the town. I deducted $500 for the building, under Cooley's testimony.

Lots 133 to 136 of original plat lie between Bank St. and C. & N. W. right of way, and I don't know whether there were business places on them or not. In all my computations, I included simply the land inside the lot line. On lot 136, to include the street would add 6,700 square feet, approximately, and makes the price
1462 per acre $22,651.20; including the streets in the Gately description, lot 86, makes the assessed value $40,510.80 per acre, reduced from $87,120. The assessed value of lot 86 is $6,500.

1463 On July 21, 1914.

JACOB P. WERNER, a witness called by plaintiff.

Direct examination.

By Mr. Eldredge:

I live at Marquette; am in business there. I am one of the five City Commissioners. I own real estate on Front St. I have bought and sold real estate in Marquette, and think I know its value in the business part of the city. For the land, without buildings, on southwest corner Front and Washington, 55 feet on Front by 127 on Washington, I would consider $350 a foot front on Front a fair price.

WERNER.

Cross-examination.

By Mr. Wykes:

I purchased property below this, across the street, about 12 years ago. I don't know of any sales anywhere near this price of $350 a front foot on Front. I base the valuation on what I paid for my property and what I consider it worth, and upon the rent return I could get. I paid $7,500 for 32 feet, 127 feet deep, with a foundation and cellar excavation.

I don't know what the corner in question could rent for; you could hardly figure the value of a lot on present buildings. It is the best corner in town, and the buildings are not good enough for the lot. It is better than any of the other three corners. It is the best piece of property in town.

1464 On August 11, 1914.

F. J. BACHELDER, a witness called by defendants.

Direct examination.

By Mr. Wykes:

I live at Madison, Wis., and am Engineer of Track Inspection of Wisconsin Railroad Commission, having been connected with the Commission about six months; my last previous employment was as Division Engineer of the Baltimore & Ohio, being such from 1905 to 1914. I have been employed by other railroads.

I took civil engineering course in University of Wisconsin, and am a member of the American Railway Engineering and Maintenance of Way Association, having been a member of the committees on tracks, on bridges, and on records and accounts.

From August 1st to 6th, 1914, I made a trip of inspection over South Shore. We covered practically the whole main line, except a short distance on the west end. Altogether, we rode over 800 miles on passenger trains, rode a distance on two freight trains, and walked about 25 miles of the track. Messrs. Atwood and Bristol were with me, except part of the time, and they made all the trips with me on foot.

We observed the effect of traffic on ties, rails and the roadbed, in general—of the entire track structure, including bridges. On curves, we observed the elevations, rail wear, and the effects of the various traffics; we observed the train speeds, taking them between mile posts, and getting the time between terminals. I observed the amount of wear on track on curves and tangents, and made comparisons. On B. & O., I did work in testing various materials with a view to determining the most efficient material to use and the effect of traffic on the material, and among them were studies of rail wear,
taking the rail wear on different degrees of curves and test-
1465 ing different kinds of steel rail. The tests were chosen on the
tracks where the heavy tonnage passed; it was not a study of the traffic, but of the rail wear, and we selected the tracks over which the heavy tonnage passed.

I covered the South Shore line with sufficient detail to express an opinion upon whether the road is maintained in a degree of excellence in excess of what would be required if the traffic were limited to freight, and I have an opinion upon that subject. I do not think the maintenance of the South Shore is of too high a standard for the freight traffic they have. If the track is allowed to get out of surface, it becomes harder for a train to pull an equal tonnage over the poor track than over a track in good surface.

There is undoubtedly an added wear on equipment from poor track maintenance. It takes more coal to haul loads over poorly maintained track and over rough track—more to pull the same load; it requires greater amount of power, or causes reduced tonnage. The only thing on the South Shore which, in my judgment, would be done for the operation of passenger trains would be the expense in painting buildings for appearance before it would be necessary to paint for the protection of the lumber. In track, the one added expense, for passenger service only, would be around station grounds, where lawns would be trimmed neater, and along the track they might cut a grass line. I did not see a grass line in many places; they were working at it. A portion of the trimming of weeds from the ballast, for neatness, would be for passenger traffic.

I recently examined exclusive freight tracks of the C. & N. W., on the St. Francis cut-off, between Milwaukee and Chicago; that freight line is of a higher standard of maintenance than the South Shore. I am familiar with the exclusive freight lines of the B. & O., and
while the wear on those is heavier than on South Shore, the
1466 standard of maintenance was about the same; that was the
Medina cutoff, of about 8 miles—a low grade line, used for freight trains exclusively.

In my inspection and investigation of South Shore, I had in mind the question of which traffic produces the greater wear on the track structure, and, in my judgment, the greater cost for maintenance due to mechanical wear is the freight traffic; it is considerably greater. You can compare the damage due to tonnage and to speed, by taking a district of heavy freight tonnage and comparing with it a district where it is largely passenger traffic; you would compare the damage to ties and to rail, especially on curves, and notice whether the flanges had cut into the head of the rail more on the freight or the passenger. On tangents, on very heavy traffic lines, the rail wear is perceptible. You would take the amount of wear for a month, or some stated time; that is about the only basis I know, except, with a freight traffic line, you could observe that the wear was very much greater on that line than on the passenger line.

On the C. & N. W. line, from observation of the freight line and the passenger line, it seemed to me that the freight traffic had the most wear. You know original section of the rail, and can get the amount of wear after the rail has been in track for, say, six months, and you can determine the wear per month, or for any stated period. I took rail sections on the C. & N. W.

On South Shore, we took a section of rail showing wear, in the district between L'Anse and Baraga, which is the district of their densest passenger traffic, and that showed very slight wear; we took a section between Eagle Mills and Marquette, where they handle very heavy ore tonnage, and there the wear was very heavy; the wear was on a

1467 percentage of 70 for the freight line and 30 for the passenger. The freight traffic was very much heavier between Eagle Mills and Marquette than the passenger traffic, and the passenger traffic there is somewhat heavier than between L'Anse and Baraga.

In going over the line, we took care to observe the curves, the degree of elevation and of curvature; we took measurements of elevations on about 13 curves. I also, on other curves, observed the riding quality of the track from passing over on the trains. You could thus observe the approximate elevation in the effect on the track. We took measurements where we walked over track, between Negaunee and Ishpeming, between Eagle Mills and Marquette, between Baraga and L'Anse, and at various points where we stopped a sufficient time when on freight trains.

In the 25 miles we walked over the track, we inspected the curves, to ascertain the amount of flow and wear due to the super-elevation of the upper rail. There was very little flowing of the metal. Where it does exist, it is usually on the lower side of the curves, indicating super-elevation; there is a small amount of that. I have platted, on diagrams, the amount of flow found.

I inspected the ties, to ascertain whether they were taken out on account of wear or weather causes; in the district of dense passenger traffic, Nestoria to Houghton, it appeared to me the larger percentage were taken out because of decay, and in the district of heavy

freight traffic, while there were certain taken out on account of decay, a much larger proportion were taken out on account of the ties being cut or worn by the rails. I took pictures to indicate typical instances of rail cutting of ties. (Photographs produced and marked Defts.' Ex. 31, Batchelder.) I took photographs to indicate typical conditions of ties taken out due to decay. (Photographs marked Defts.' Ex. 82, Batchelder.) On the parts of the road I examined, the cause of tie renewals would be the decay and the cutting of rail, about half and half. It looked to me, from the amount of work they had done, that the maintenance was increasing—the degree
1468 of maintenance.

On B. & O., comparing the tonnage line, over which the heavy freight traffic moved, with the line over which passenger traffic was done, the evidences of greater wear were on the freight line; that line was not engaged in exclusive freight. We took rail sections in our study of the problem on the B. & O., to indicate effect of tonnage movement.

For the purpose of study of rail wear of B. & O., we took the track on which the heavy traffic moved; the line was double track; the heavy traffic moved on the eastbound track, and the empties were returned on the west bound track, and the rail sections were taken on the eastbound track. We took that track for study and for sections, as it indicated the heavy wear, and the other track didn't make as good a location for our test, because it didn't have the heavy wear. Passenger traffic moved over both tracks, there being the same quantity of passenger traffic on each—corresponding trains in opposite directions. The loads of coal moved on the eastbound track, on which there was a much heavier freight tonnage.

The result of studies of rail wear on this heavy tonnage track is indicated by certain charts I have produced, six in number. The purpose of the investigation was to determine whether a rail with a wider head on the flange side would add to rail life. The measurements taken indicated a heavy rail wear on the high tonnage line, and a short life of rail on that line, and that, after the rail had been in track a short time, the head wore back to a point above the web on the *guage* side. I found there that the time in which the tonnage wore the A. S. C. E. sections back to a point above the web varied with the degree of curve; for a three degree and 30 minute curve, the rail life was 32 months, and in this rail the wear was almost back to the side of the web, next to the *guage* side.

1469 On a compound curve, four degrees and 36 minutes, and six degree curve, on the eastbound track, a Manning rail was worn so that the throat of the flange came back to the side of the web, next to the *guage*, in 31 months; on the upper rail, it was worn back to a point above the inside of the web. At that point, the rail was elevated for safe passenger and freight train speeds,—a medium speed,—especially on the ruling grades.

On a compound curve, five degrees and 30 minutes, and an eight degree curve, the life of Manning rail was 31 months. On a Man-

ning rail, the flange side of the head is increased in width about 3/8 of an inch, giving additional wear area on the gauge side; on that rail, the wear was to over the inside of the web. On another Manning section, in a six degree and 30 minute curve, the rail life was 31 months, and the wear was a little further back. Those are all outside rails. None of those show low rail wear, as the Manning section was only put on the high side. There was very heavy rail wear on the low rail, especially on the grades; it was more flow; it wasn't necessary to take it out of track as quick as you would the high, on account of the flow, because you had more lateral strength in your rail. The cause of this wear was the freight traffic.

We found no curve on South Shore that had anything worn quite as excessively as on the B. & O. I found on their low grade line, between Ishpeming and Negaunee, some wear on the high side of a curve that approximated this wear. Generally speaking, I did not find the rail on curves on South Shore worn to the extent to which they are on the curves I have just described. The rail between Ishpeming and Negaunee that had large wear bore an old date, and I couldn't get reliable information on how long it had been there.

I examined some of the ore cars and loads, and their constructions; their wheel base is shorter than the ordinary hopper car I have been familiar with, concentrating the load more on a
1470 bridge or a short stretch of track. It would probably produce a larger stress on track, on account of the concentrated load, when under speed, than the same weight of car with a longer wheel base, and on a bridge it would produce a greater stress than as if the load were more distributed, depending on the span. From the wheel base and study of some of the spans, I found these ore cars would produce a greater stress on some of the bridges than some of the locomotives would. It is a fifty ton car; the cars themselves weigh 33,000 to 35,000 pounds. I think they have a locomotive weighing 190,000 pounds, but that has a longer base. I had the company's locomotive diagrams.

The higher center of gravity of a load, if it is on a curve, will tend to crowd the high rail, and on straight track an engine with a high center of gravity and any inequalities in track will tend to cause it to roll or rock, and the higher center of gravity will tend to push the gauge of your track out of line; the hazard of derailments is also greater. I noticed two derailments when we were there, or their effects; there were a good many broken ties, in a pile, outside the track. I was told by a conductor it was a freight train derailment. Derailment is a source of considerable expense for track structure at times.

The freight train derailment damages track very much more than a passenger train derailment. The effect is usually a great many more broken ties from your heavy freight cars derailed than from your passenger train. For the passenger train, usually, part of the engine equipment is derailed—the tender usually—and it scars the ties, but does not break them as much as a freight derailment. In

my experience, freight derailments are more frequent than passenger derailments.

I platted, on the charts, the rail wear on three South Shore curves. (Blueprint marked Defts.' Ex. 83, Batchelder.)

1471 I did not mean the tie renewals would be half decay and half wear for the road, but for the district where those pictures (Defts.' Ex. 81 and 82) were taken. I made computations, or notes, fixing the amount of rail wear for freight trains at 62% on the whole line, and 32% passenger, taking this from counting ties in track in a district 3,000 feet long. I attribute the rail cutting to freight; your decay would be divided between freight and passenger on the percentage of the traffic of the two, but your wear is attributable to the freight trains, which cause a large percentage of the cutting of ties.

On this road, the cutting by freight trains would probably amount to 90%; that would be from observation of your heavy loads, and the relative effect of your heavy loads and your light passenger cars. I don't think the locomotive cuts the ties as much as the car, on account of your equalizers on your engine; the shock is taken up by the equalizers, and you wouldn't get as much of a shock from track being out of surface from your engine, because it is better distributed over your equalizers. Your freight car has springs, but they are not nearly as effective as the equalizer springs in your engine, or in your passenger cars. In estimating 90% of the cutting due to freight, the volume of freight carried and the weight of your car would necessarily enter into it. In the line, Nestoria to Houghton, it is perceptible that the rail did not cut the ties nearly as much as where they carried the heavy freight traffic, between Nestoria and Marquette. Defts.' Ex. 83, Batchelder, charts measurements of a four degree curve east of Baraga, laid July, 1912, a five degree curve west of Bagdad, laid August, 1912, and a five degree curve one mile west of Negaunee, laid August, 1911. I chose those curves with reference to the degree of the curve, but not especially on account of the wear; I aimed to take them on a particular curve, to be a representative section; that is, not any defective rail, or anything of that character.

1472 The fact that I could secure date of laying had to do with the particular section; it was all new 80 pound rail, laid within the last two or three years.

Those sections and measurements don't indicate anything what you would call excess wear due to super-elevation. The effect of super-elevation is largely indicated on the low rail; if your elevation is too great for your speed, especially for your freight trains, in a very heavy traffic district, the metal flows on the low side of the rail, and the rail tends to cant out when you have too much elevation. Too much elevation tends to increase the wear on low rail; I never noticed any material difference in the high rail, but the tendency is to increase the weight on the low rail by super-elevating. On the rails shown on Defts.' Ex. 83, the greater amount of wear in each instance is on the upper rail.

Expressed in square inches of wear, the reduction is: On four degree curve east of Baraga, upper rail, .02 of square inch, and low rail, — of square inch; on five degree curve west of Bagdad, high rail, .09 of square inch, and low rail, .05 of square inch; on five degree curve west of Negaunee, high rail, .14 of square inch, and low rail, .13 of square inch. The total wearing area of the head of an 85 pound rail would be 3.49 square inches.

On the Cumberland Division of the B. & O., on the eastbound track, the high rail on a seven degree curve was worn 1.2 square inches in area, in 31 months; on a compound curve, five degrees and 30 minutes and six degrees, the reduction of the high rail was .255, and of the low .18, of an inch, in 4.5 months.

On a compound, eight degree and seven degree and 30 minute curve, the reduction on the high rail was .22, and on the low, .257, of a square inch, in 4.5 months. On a compound curve, five degrees and 30 minutes and eight degrees, the reduction on the high side was 1.14 inches in 31 months. On a seven degree and 30 minute curve on Cumberland Division, the reduction on high side of
1473 curve was 1.2 square inches in 31 months. On a two degree and 15 minute curve, the reduction on high rail was 1.495 square inches in 43.5 months. On a four degree curve, the reduction of the high rail was 1.595 square inches in 43.5 months. On a ten degree curve, the reduction on high rail was 1.71 square inches in 27 months.

In study of rail wear of B. & O., I spent a month in the field, taking sections of rail with a machine. I studied amount of elevation on South Shore, and came to the conclusion that they were elevated for a speed of 35 to 40 miles an hour—a safe speed.

BATCHELDER.

Cross-examination.

By Mr. Eldredge:

I have never been directly concerned with operation. As division engineer, my duties included maintenance of the track and track structure.

The following quotation from pages 13 and 14 of an article of C. P. Howard in Bulletin 115 of American Railway Engineering and Maintenance of Way Association, published September, 1909, represents my judgment:

"Objections to curvature increase with the speed of trains. We assume this to be a fact; which is to say, it is justifiable to spend more money per daily train to take out one degree of central angle on a fast line between New York and Chicago, than on a slow-speed coal branch in the mountains. It is difficult to prove this by mathematics. The centrifugal force increases as the square of the speed. The super-elevation of rail designed to resist this force is a palliative

rather than a cure, and when elevated for high-speed trains, is charged with being a prolific cause of derailment for slow trains. Moreover, on track elevated for forty-five miles an hour, trains may run at fifty or sixty, and when elevated for sixty miles, a speed of seventy or eighty miles may sometimes be attained. For freight trains the conditions are different. Wellington says (page 268): 'It is fully as difficult and dangerous to run freight trains over sharp curves at twenty-five or thirty miles per hour as passenger trains at sixty miles per hour, owing to the difference in their mechanical condition.' We may, therefore, take about one-half the passenger train maximum as a corresponding maximum for freight
1474 trains, and it may be sufficiently accurate in many cases to figure only on the speed of passenger trains on the assumption that the speed of freights will be proportionately lower so as to give about the same economy and safety in operating over any given curve."

I have the data respecting relative rail wear on freight and passenger line on C. & N. W., between Chicago and Milwaukee. I took measurements on curves on the passenger line and on the freight line.

A heavy freight train, if stopped on track, tends to pull the rail and cause it to creep in the direction of the movement of the train, the amount of creeping depending on the weight of your train and tonnage, and the creeping during a particular period depending upon the amount of tonnage carried over the track; the number of stops would enter into it.

This creeping effect is not very noticeable under passenger traffic. On double track, where the loads are moved largely in one direction, the creeping of the rails is very much greater than in the opposite direction, where only the passenger trains and empties are moved; the most serious effect is to throw the track out of line; it causes the ties to slew together, and damages them, and pulls the spikes, and the rail and angle bars cut the ties; it permanently damages the rail, and the creeping of track tends to close up the expansion, and tucks or bends the rail at the joints, and gives it a permanent set.

It requires the track force to align the track, to drive back the rail, and open up the expansion, especially in hot weather, and the renewing of the rail becomes necessary; when your rail gets bent at the joints, the heavy traffic going over it tends to pound or batter the ends of the rail, and makes it necessary to renew it much sooner than otherwise, causing tie replacement and labor.

1475 In testifying, yesterday, to greater track damage from freight, I considered the character of freight equipment, and the shifting of loads. The freight equipment is not of as high character or design as your passenger equipment, and it is not maintained to as high a standard; rather, you could call it a crude construction, compared with the passenger train equipment, in that it only has four wheel trucks, while most of the passenger equipment has six wheel trucks, and the springs are more elaborate in your

passenger equipment, and your side bearings are kept oiled; usually, they have some patented side bearing on the coach roller bearing. It is not customary to oil the side bearings of freight cars, so, when they are in a certain position, supposing they are not traveling in the direct line of your tangent, the tendency is for them to hold that position until they are guided, and not oiling them, and not being as true, they don't guide as easy.

The loading of freight equipment, of course, would shift, and it very often causes a car to be down on one side bearing, which will tend to hold the truck in a position not in the line of the direction it is taking—the direction of the rail—and, if it is not down on the side bearing, that is shifted enough so it holds the car down on its side bearing, on the bolster, it will tend to rock the car, keep the car rocking, and, of course, any impact that the track would get from the rocking of the car would cause more damage to the track.

I also had in mind imperfections in wheels and difference in wheel construction, and things of that character. A flat wheel on a freight car is not removed anywhere near the same time as on passenger equipment. You have a flat wheel on passenger equipment, and it is removed at once, and discipline is very severe for anyone who flattens a wheel on passenger equipment. The items I have spoken of as causing greater freight wear would be appreciable, as a whole; they represent considerable items.

1476 I went on to the L. S. & I. railroad and made investigation to determine whether that was of a higher or lower degree of maintenance than South Shore. I found their standard of track construction was better than that of the South Shore.

I took photographs to illustrate this. In addition to maintaining as good surface as the South Shore, they have tie plates on curves, saving the tie from being damaged by rail cutting, and assisting in maintaining the gu*a*ge. That gives two or three spikes to help keep the rail in place or in gauge; on some of their curves they had tie rods. The South Shore, without tie plates, would have only one spike outside the curve rail, to take the thrust, while, with the tie plate, the outside and inside spike both help maintain the gu*a*ge and take the outward thrust. (This has a bearing, because the L. S. & I. is an exclusive freight road, with the exception of a very limited passenger service, and is better maintained than South Shore.) The joints on L. S. & I. are re-inforced, and more expensively constructed. They vary from the ordinary angle bar, in that it is a truss effect; the joint has wider flange, and this flange is so rolled that it forms a truss under the joint, and gives better rail support.

1477 On August 12, 1914.

LEVI P. ATWOOD, a witness called by the defendants.

Direct examination.

By Mr. Wykes:

I live at Madison, Wis. I am on the engineering staff of the Railroad Commission of Wisconsin, and have been since March 1, 1914. I have been more or less actively connected with railroad work since the beginning of 1896.

I was in the Maintenance of Way department, in the beginning of the year 1896, on the Peoria & Pekin Union Railroad. In the summer of 1886, I went to the Rio Grande Sierra Madre & Pacific in Mexico, as Assistant Engineer, and in 1987 I was made Engineer of Maintenance of Way of the same road, and I was with them practically all the time, in that capacity, until 1903. I was then made Superintendent of the road, and, in that capacity, had charge of maintenance of way department; while in that capacity, I also served as Chief Engineer of the Sierra Madre extension, in Mexico; that was intended to be a portion of the road of which I was superintendent, but was a separate organization. In March, 1905, I became Engineer of Maintenance of Way of the Chicago, Peoria & St. Louis Railway; I was with them for a few months, and was transferred to the Litchfield & Madison Railway, as Superintendent. I stayed with that road until the spring or summer of 1906, and I became Assistant Engineer on the Southern Pacific lines of Mexico, in charge of operation of lines that were constructed but had not yet been turned over to the operating department. I there fulfilled the duties of Superintendent and General Storekeeper, and had charge of the transportation, maintenance of way and equipment, work pertaining to the lines under operation but still in the hands of the chief engineer.

I left the service of the Southern Pacific in 1906, and engaged in private practice, in California, with headquarters at El Paso, Texas. During that time, I performed various classes of engineering work,
1478 covering some railroad location and construction and a great deal of railroad reconnais-ance work in connection with general engineering matters. Those were just railroad matters that came to me in connection with my private practice; but, during that time, I did considerable reconnais-ance and railroad construction.

None of the roads on which I did reconnais-ance or location work had been built, with the exception of one road that I started construction of and which was stopped because of the Mexican revolution, after I had it partially completed.

I am a graduate of the High School of Rockford, Illinois, and of the University of Illinois, in civil engineering; also a business course, at Rockford.

I accompanied Mr. Batchelder on trip over the South Shore, the itinerary of which was correctly stated by him. My purpose was to observe the character of the roadbed, with reference to condition, maintenance, and the traffic. I investigated it with reference to the character and degree of its maintenance, endeavoring to keep in mind the roadbed, ties and rails, to the greatest extent possible.

We spent five days, from August 1st to 6th, and I walked over 25 miles of the track, and observed the elevation on a considerable number of curves, and I observed that, in most cases, the wear predominated on the outer rail, where there was very much wear in evidence. I noted the curve elevations were not always uniform, nor consistent.

I rode on two freight trains, and took the speeds. The maximum freight train speed I found was 34 miles. It was our intention to catch maximum speeds, and we took none under 25 miles an hour of freight trains. We took 18 different instances, as I recall, and none of them happened to fall below 25 miles an hour; on
1479 two different freight trains, the maximum was 34 miles. We took the time a considerable number of timees between various mile posts on different passenger trains, to ascertain the speeds, and found the actual running time between mile posts to be 53 miles, maximum, and a majority of the miles we took fell between 40 and 45 miles. We took 68 different speeds, and the majority fell between 40 and 45 miles, when we thought they were running probably at their maximum speed, or at places where you might expect maximum speed, the purpose being to catch actual maximums.

In my engineering work, I have had charge of maintenance. On the Litchfield & Madison Railroad, of which I was Superintendent, 40 odd miles out of 50 was engaged in exclusive freight service.

My investigation of South Shore was sufficient to permit me to form an opinion as to whether the road was maintained in a higher degree of efficiency than it should be if the road were engaged in freight service alone, and I did form an opinion on that question. In my judgment, the South Shore is not maintained to a higher degree of perfection or efficiency than it should be if its business were limited to freight.

My investigation was directed to that particular question. I think it is maintained in a condition that is entirely safe for passenger business. I saw some things that, if I was in charge, I would like to improve; but, from the character of maintenance and the information I had, I considered the road in very good shape, as far as maintenance is concerned. In my judgment and experience, I would want the roadbed kept in just as good or better condition, as to its strength, for freight traffic than for passenger traffic, so far as roadbed and track is concerned. That includes the track and road structure, and I am referring to strength, not to appearance.

1480 A poor degree of maintenance adds very materially to the cost of operation; as the degree of maintenance drops off, the cost of operation, with reference to those items that are affected by the perfection or imperfection of the track, increases in a greater ratio.

If the maintenance work is neglected, and the joints become low, bolts loose in the angle bars, and track and roadbed not properly drained, the ties commence to churn, and, if they are not taken care of very quickly, they get in a much worse shape very rapidly, and it takes more force and costs more to get them back in shape than it would if it was kept up. The old adage "a stitch in time saves nine" is applicable to track maintenance. It works not only with reference to the track expense, but also -as a deleterious effect upon the repair and maintenance of equipment.

It also has an effect upon the capacity of loads, if it gets to a bad enough degree. It has an effect upon the cost of coal, and will affect all items with reference to getting the trains over the line These costs would increase as the degree of maintenance went down.

The South Shore tie renewals are due to decay and mechanical wear. The cause varies in different parts of the road. The majority of ties I examined, Nestoria to Houghton, were taken out because of natural decay, and at different places along the main line, particularly between Marquette and Nestoria, the majority of ties came out because of mechanical wear, rather than decay. I noticed more cut ties in track, Marquette to Nestoria, and east of Marquette, and west of Nestoria, than between Nestoria and Houghton. When I say cut ties, I mean cut to an inch or more. I noticed most cutting between Marquette and Nestoria.

In the curves I observed, I noticed very little wear on the inner rail; the wear was mostly confined to the outer rail. I looked for the wear on both rails.

1481 The intention on this road seems to be to carry an elevation that is correct for speed between 35 and 40 miles an hour, though the elevation is not consistent, and varies at different curves of the same degree, and in the elevation of the same curve. I arrived at their intention from the examination of the elevation and answers of different track men as to elevations they were intending or instructed to carry. I examined curves wherever I had an opportunity, examining all the curves where I walked over the track. I took the elevation on, and made a record for, 13 curves.

I have four different curves of 4 degree, with elevations of one inch, 1⅜ inches, 1½ inches, 1¼ inches, 1¾ inches, and 1⅛ inches, all on four degree curves. On a 2½ degree curve is an elevation of 1⅝ and 2½ inches, at different points. On a 3 degree curve, at three different points, were elevations of 2⅝ and 2⅞ inches. Thus, elevations of the same curve would be taken at different points on the curve.

That would not account for the difference. The super-elevation, measured with these different results, shows that they are not consistently maintained in elevation, nor is the same degree of elevation carried on all curves of the same degree. Most of these curves were measured at random, as we came to them in the course of our walk; wherever rail section was taken for rail wear, we took the elevation at that point, also, but others were simply at random on the curve we were walking over. We didn't pick out a curve and go to it with the

specific object of measuring its elevation, and didn't measure some and then exclude the measurements. I was also careful to take the measurement so it wouldn't be affected by the "run-off."

My judgment is that, on South Shore, the freight train mile would cost more, with reference to those items pertaining to roadbed, rail, ties, ballast, sub-grade and bridges, than the passenger train mile.

1482 I assisted Mr. Batchelder in taking the measurements of rail sections shown on Defts.' Ex. 83, Batchelder, and that exhibit correctly shows the conditions as we found them.

There was no pre-meditation with reference to where we walked. For instance, at Soo Jct., Kenton and Trout Creek, we walked because the train service gave us the time; we dropped off the train at Baraga, to walk to L'Anse, and that is the only place that we anticipated where we were going to walk. When we were off the trains, between trains at different points, we utilized the time walking and observing the track, but that is not included in the list, because it wasn't distance enough to mention.

I noted all the track labor working as I passed over the line, making a memorandum of the track forces. I took the limits of the sections from the profiles, and tabulated the data, to form some conclusion as to the maintenance forces and their distribution. There is more labor in the portion of the track, Marquette to Winthrop Jct. (north line), than anywhere else on the line that I saw; the next in order is Marquette to Eagle Mills (south line); the next, Nestoria to Houghton; the next, Winthrop Jct. to Nestoria; the next, Soo Jct. to Marquette, the next, St. Ignace to Soo Jct.; and the least, Soo to Soo Jct. Marquette to Winthrop Jct., there was an average of .79 of a mile of main track per man I saw working, and Marquette to Eagle Mills, .86 of a mile per track man. That does not include the extra gangs I saw working, but only the regular maintenance forces.

I was firmly convinced in my own mind, after making a trip over the road, that renewals and betterments work had been rather heavy in recent years, and that was confirmed, in my opinion, by statistics that were made available for my observation after I returned, with reference to tie renewals over a considerable period of years

1483 past, and also with reference to the charges against the maintenance of way accounts for a very considerable number of years past, and they tended to confirm the opinion that I had formed by going over the road, that renewals and betterment work had been rather extensive in recent years. Of course, the rail showed for itself.

The Master: Then your judgment would be that, previous to recent years that you refer to, it was not kept up as it ought to be?

A. I couldn't say as to that.

The Master: That would follow, wouldn't it, from your testimony?

A. Just a deduction that one might make; I never saw the road in years past.

The Master: Wouldn't that follow from your testimony that you have given heretofore?

A. Not entirely. This might be the condition: The road ten years ago might have been in just as good a degree of maintenance as it is today, but, through tightening of money, or desire of the management, or for some purpose, the expenses for maintenance of way might have been curtailed, and, by the way, that is the first department that always gets it, whenever there is anything shut off, the maintenance of way department is generally the first one that has to reduce expenses, and had they started in then to curtail their maintenance of way expenses, without any intention of letting the road get away from them, nevertheless, it might have deteriorated more than they anticipated or had thought that it would, and three or four, or possibly five, years of that kind of maintenance would get it in such shape that it would be necessary to make unusual expenditures to get it back into the shape that it might have been, say, ten years ago, without any intention to let it get down below normal condition. From the road itself, except the rail, there was nothing to indicate when the improvements were made.

1489 Train 55 is a freight. With reference to this train, I noted the actual running time between mile posts in nine instances. I noted all the stops between stations, and from the total time between stations I deducted the actual time the train was at a standstill, and divided that by the miles, thus arriving at the actual average running time, including the running time of getting under way and making the stops, but eliminating the time the train was standing still.

Train 33, a freight, treated in the same manner, showed actual average running speed of 25 miles an hour, and between mile posts D 19 and D 20, on a four degree curve, level track, a speed of 30 miles an hour was noted.

In this tabulation, the first column gives the date, the next two give the mile posts, the next two give the minutes and seconds of actual running time, the next gives the miles per hour, the next gives the average running speed, the next gives the grades, the next, whether on a curve, and the last column is remarks, including the intermediate stops, noted with a stop watch. The average card speed noted is the difference between the leaving and arriving time, as shown on the time card, divided by the distance between stations. The average running speed is the actual time the train consumed while under motion. All trains but 55 and 33 were passenger.

In taking the two freight trains, there was no design except to facilitate the time on the road, and to expedite covering the road in the shortest time possible.

It takes a little longer time to start a freight than a passenger train, depending on the tonnage and engine, the grades, and the place on the track at which the train starts and stops; but, generally, it takes more time to get a freight train under headway and slow it down than it does a passenger train. On South Shore, there
1490 is no great amount of extra time used in slowing down freight trains; but, generally speaking, it does take more time, as

the brakes are not as efficient on a freight train for quick stops, and the freight engines are not designed to accelerate their speeds as quickly as are the passenger engines.

1491 On August 12, 1914.

G. F. BRISTOL, a witness called for defendants.

Direct examination.

By Mr. Wykes:

I live in Grand Rapids, and am, and have for eight years been, engaged in contracting for concrete foundations, principally railroad bridge foundations. Previous to that, was in the employ of the Pere Marquette for 17 years, in the engineering department, in various capacities, on location, construction and maintenance of way, four years being spent as Assistant Engineer in charge of maintenance of buildings and bridges. My territory covered the Grand Rapids district, of about one thousand miles of main line.

I am at present assisting Professors Cooley and Riggs in making valuation of the Pere Marquette, having been on that work two weeks, and being employed by Mr. Riggs.

In my work for Pere Marquette, I became familiar with the character and degree of maintenance necessary for different services. I went over the South Shore with Messrs. Atwood and Batchelder. The description of the trip was substantially as stated by them.

It was my purpose to observe, and I did observe, the same things entering into the track structure as Mr. Batchelder testified to observing. I formed an opinion upon whether the South Shore bridges would be of any less expensive type or maintained in any less degree than at present if the service was limited to freight. My opinion is that the bridges are, for safe and efficient freight traffic, none too well maintained, and the types none too good.

Taking the track structure and roadbed of the South Shore, which I examined, as a whole, my investigation was sufficient to permit me to form an opinion of whether the degree of maintenance was beyond what would be required if the road had freight service only.

1492 I formed an opinion upon that question. It was that, for efficient and economical freight operation, I would not advise a lower degree of maintenance.

Our observation of ties removed from the track seemed to point very strongly to the predominance of wear as determining the removal of ties from track. We noticed ties in track for rail cutting, and the rail cutting was quite general over the line. In walking over the track, we observed all the curves we passed over, for degree of elevation and amount of wear. I formed the opinion that it took more time to get freight trains under motion, and make station stops, than passenger.

The freight trains on which we rode did not take sidings at any time during their trip. When the engine was doing stational work,

the train stood on the main track. The longest time I have in mind that the freight train kept the main line while the locomotive was doing stational work was an hour and forty-two minutes, which was at Trout Creek. During that time, the locomotive was switching in the yard, and standing with the peddler cars unloading freight. The caboose and several cars ahead stood on the main line.

On our trip, L'Anse to Houghton, on the local, the train kept the main track clear through to the Houghton yard, and the longest stop we made was at Chassell, where the engine switched in the lumber yard tracks and did work at the freight station, while the caboose and rear end of the train kept the main track. While making stops at stations, the locomotive was working part of the time and standing still part. On entering a station, they usually stop the peddler car in front of the freight house, at which local freight was loaded and unloaded. If any switching was to be done, part of the crew would cut the engine off and work on the siding, switching out and placing cars, the balance being engaged in handling local
1493 freight.

(Agreed that, of the expenses of Mackinaw Transportation Co., June 1, 1912, to April 20, 1913, Soo Line paid $12,365.62 and D. S. S. & A. $18,310.80, of a total net expense of $30,676.42. In addition, D. S. S. & A. paid $50,911.46 on the new boat and contributions to boat replacement, making a total for D. S. S. & A. of $69,222.26.)

(Admitted by plaintiff that in minority report at 1914 session of American Railway Engineering Association, C. P. Howard being one of the signers, the statement was made:)

"Last year the attempt was made to divide the expense of maintenance between passenger and freight, using a multiple two for passenger tons. Because this multiple was rejected by the association as not proven does not minimize the importance of securing information on the subject."

1494 *Testimony Before the Court (on the Trial).*

1495 GEORGE L. FOWLER, a witness for plaintiff, produced before the Court on Nov. 20, 1917.

Direct examination.

By Mr. Eldredge:

I live in New York City; am 62 years old. I am a consulting engineer, without the degree of Mechanical Engineer. I am a graduate of Amherst, have taken the course of mechanical engineering in Columbia University, and have been in mechanical work all my life.

On leaving college, I entered a machine shop engaged in manufacturing cars and running gear, and learned the machinists' trade. I then went to the Industrial Works of Bay City Mich., in charge of their drawing department, manufacturing excavators, pile drivers,

and similar machinery. Then I was assistant to Master Mechanic on the old Flint & Pere Marquette Railroad, at Saginaw, Mich.; afterwards, Superintendent of the A. T. Bartlett Co. of Saginaw; and since then I have been Superintendent of the Peckham Truck Mfg. Co. of Kingston, N. Y., and since I have been engaged in mechanical work, research work mostly, in regard to cars, locomotives and railroad work generally.

I am able to value locomotive engines and determine their condition; I was employed by plaintiff for that purpose, going to Marquette, last September, 1917.

I made a personal inspection of all the engines that ran into Marquette, and the switching engines at Ishpeming and Negaunee, making a careful external examination of all such parts of those engines as were easily accessible without having the engines dismantled. I think I saw and examined 45 engines out of a total of 78. I went to the records of the company and examined in detail the repair costs for labor and material of every engine on the road, and,
1496 inasmuch as repairs for the engines which I did not see were right on a par with those which I saw, I assumed that their physical condition would be at least as good as those which I had the privilege of examining. I had an opportunity to examine the interior of boilers that were in the shops for general repairs, and went over the scrap heap, and looked up the matter of the tubes which had been removed. I also saw a number of the engines which had been washed out, and the general condition of the water at the same time. The 45 engines which I examined included every type of engine now in use on this road. After making this examination and obtaining this data, I made a valuation of every locomotive, which valuation is shown on plaintiff's Ex. 211.

I made a similar valuation of the passenger train cars, which is shown on plaintiff's Ex. 212. I first made an inspection of such passenger train cars as were accessible at Marquette, and also went out to Michigamme to make an inspection of the cars which were standon the track there, and which did not come into Marquette. That included every type of passenger train car that was in use upon the road. I inspected those cars as they came through on the through trains, sometimes making several visits to the same train, in order to have time to take the whole train. And also the cars that were standing in the passenger yard at Marquette. I made the inspection in essentially the same way that I did the locomotives. I looked over the trucks, the under framing of the car, condition of the interior, condition of the floor, condition of the platforms, couplers, air brakes, and everything that was visible to an ordinary inspection, and then wrote in my books the memorandum of my opinion of the physical condition of the cars.

I assumed the condition value of the cars for 1913 to be the same as that set down by Mr. Riggs in 1913, and then, in order
1496a to obtain the reproduction value of the cars, I found that the Barney & Smith Car Co. of Dayton, Ohio, had built a large number of cars for the company, and I went to them for estimates of the cost of reproduction of those cars for the years 1914,

1915, 1916 and 1917. They made such an estimate, and gave me access to copies which I have, original copies of all of the figures upon which that estimate was based. The result was that the estimate which they furnished and which I have checked off from their original figures agrees exactly with the Riggs valuation for 1913. I then took their figures, or took these figures for 1914, 1915, 1916 and 1917, and wrote them in after these figures.

Then I took the percentage of increase for each class of rolling stock. For example, you take a first class coach and take the percentage of increase as obtained from the Barney & Smith Co. for the first class coach which they made the figures on for 1914. It was about six per cent, I think, in advance, something of that sort. Then for 1915 I took their figure in advance, and for 1916 and 1917. Then I applied that percentage of change of value to all of the other first class coaches on that road for which I did not obtain a direct estimate, applied that percentage of change of value to the Riggs valuation of 1913, and in that way I wrote in reproduction cost of each individual car on the road for the four following years. Then in order to obtain the current value, present value, as it is marked on the schedule, I took the condition valuation of Riggs for 1913 and applied the Master Car Builders' rules of depreciation for the depreciation of passenger car rolling stock. That rule is that the depreciation shall be straight three per cent per annum down to 50% beyond which there shall be no further depreciation, so that when I found a car on the Riggs valuation where he had given it a 50% value in 1913, I wrote "No further depreciation" on
1496*b* that car, but for cars where he had a higher value, 70%, 80% or 90% or whatever it might be, on those cars I deducted three per cent per annum for the four years, making a total of 12% for the valuation of 1917, and in that way obtained the value—the current value—of each car in the passenger train equipment of the road.

I examined 35 out of 72 cars, and found no car in less than 50% condition, so far as my own examination of its physical condition was concerned.

I also made a valuation of freight train cars, shown on plaintiff's Ex. 213, and shop machinery and tools, shown on plaintiff's Ex. 214.

For freight train cars in service in 1913, I assumed the Riggs valuation of 1913 as a basis, obtained manufacturers' prices for 1914, 1915, 1916 and 1917, and increased the Riggs cost of reproduction values accordingly. I used the Riggs condition valuation of 1913 as a basis to determine condition, and successively for each year thereafter subtracted for further depreciation according to the Master Car Builders' rule, with a minimum of 20%.

For shop machinery, I obtained scales of variance in prices for the years 1914, 1915, 1916 and 1917, and increased Riggs' 1913 values 40% accordingly. I then, to ascertain present value, applied the Riggs percentages of depreciation, no additional depreciation being allowed.

1496*c* As the result of my inspection, I made a memorandum of what I considered to be the physical condition of the engines; also of what I considered their value condition, on the basis

of the general character of the engines with reference to age and possible obsolescence. I mean by obsolescence an engine that is old and not up to the present design, so that if the railroad company were to purchase new rolling stock, they would not buy an engine of that character. Obsolescence is the only necessary depreciation, except a slight depreciation due to wear, but an engine properly maintained can be held up to its original working or physical condition through an indefinite life.

I then assumed the condition value of the engines as given by Riggs in 1913. Then, learning that the D. S. S. & A. allowed 2.5% per year depreciation on engines, and that appearing to me to be a reasonable amount, I deducted 2.5% per year from Riggs' condition value, allowing 2.5% for 1914, 5% for 1915, 7.5% for 1916 and 10% for 1917. The prices I used for engines were the average for the fiscal years.

I did not examine the locomotives for the specific purpose of confirming Riggs' values and figures.

FOWLER.

Cross-examination.

By Mr. Wykes:

I was limited by the condition value fixed by Riggs in 1913, and the depreciation allowed from that took care of the value of the engines automatically, regardless of my opinion as to its physical condition. The only thing I wanted to be sure of was that the physical conditions as I found them were as great or higher than the value conditions which would automatically come in with the allowance of the depreciation which I was giving to the engines. The 25% and high depreciation which I allowed was to take into consideration the obsolescence and decreasing physical condition.

I started with Riggs' fixed percentage, assuming that that percentage represented the condition of the locomotive, taking
1496*d* into account obsolescence at the time. I then went through the mathematical computation of cutting it down 2.5% per year. I assumed that Riggs allowed for obsolescence. If he did not, I did not understand the basis of his figures which I have taken.

My prices I obtained from the American Locomotive Co., telling them the purpose for which I was getting the figures. I did not attempt to get a price for the purpose of purchasing.

I paid no attention, whatever, to the cost prices of the engines in making my estimates. In making my valuation of locomotives, I was not interested in knowing what second-hand locomotives sold by the company were actually sold for. It was immaterial, as far as my work was concerned.

My values for locomotives for 1914-1917 were entirely independent of those of Mr. Riggs for 1913, except that I used and carried through the Riggs percentage of condition with the annual reduction of 2.5%. I did that because I believed Riggs had allowed for obsolescence in his condition value, and I was willing to accept that because of obso-

lescence, but, if Riggs did not allow obsolescence, then I allowed down to his percentage plus the depreciation, in addition to that.

I did not investigate to ascertain the cost to the company of the new locomotives purchased in 1913. I paid no attention to the 1913 valuations. The only thing I did do there was to use their condition value in 1913 as the basis for the additional depreciation. The 15 locomotives, after four years of use, are valued by me in 1917 at 30% more than they cost in 1913.

1497 NELSON CADERETTE, a witness for plaintiff produced before the Court, Nov. 20, 1917.

Direct examination.

By Mr. Tracy:

I am 46 years old, reside at Duluth, and am assistant engineer of plaintiff, having been in its employ continuously for 26 years as draughtsman, engineer of maintenance and construction on the road and in the office. In 1911 and 1913 I assisted Mr. Riggs in making and revising his inventories and valuation of plaintiff's railroad, and in 1916 started and am still working on the inventory of the road for valuation purposes for the I. C. C. In the latter I had charge of making maps and profiles and seeing that field parties took the proper quantities of materials. In the last 15 years have been over the line 2 or 3 times a month; it is a part of my duty to look for defects in the track and other things needing reporting.

I have prepared an exhibit (Pltf.'s Ex. 201) bringing the Master's valuation of June 30, 1913, down to date. My work continuously since August 1917, has consisted in making an inspection of the several structures and obtaining from records lists of property added and retired. I attempted to ascertain the condition as to depreciation. The first sheet of Ex. 201, shows the property divided into 43 schedules, the columns being: first column, list of schedules; second column, Master's valuation as of June 30, 1913, subdivided as to services. Third column, value of property retired since June 30, 1913, at the Master's values, the data being obtained from our records; fourth column, value of property added since June 30, either at cost or at average prices for 1917. The prices were obtained either from

1498 records of purchases or by consultation with engineers Young of L. S. & I., Loweth of C. M. & St. P. and Lewis of South Shore, and my personal knowledge of unit prices; fifth column indicates the Master's quantities less retirements, computing the remaining quantities at 1917 unit prices; column sixth is the total of columns four and five and is the total value of the different schedules for June 30, 1917.

Schedule 1, Right of Way and Station Grounds, includes all the land used for railroad purposes, and figures on page 1, of plaintiff's Ex. 201, shows additions and retirements correctly. Schedule 3, grading, includes clearing, grubbing, grading, excavation, embankment, retaining walls and riprap.

The retirements and additions are correctly shown.

The unit prices applied to items included under grading, appear on Sheet 12 of plaintiff's Ex. 201, and are there compared with those found by the Master, the price being 40¢ for grading, including overhaul and shrinkage. The prices used are made up of the average cost of labor and material for 1917 applied as of June 30. I made a study of the correctness of these unit prices and in my opinion they are reasonable and somewhat too low.

Actual prices paid by us for contract work on connecting track between the Negaunee and Palmer track to Winthrop track of the C. & N. W. in 1917, were clearing $60 and grubbing $264 per acre, grading 50¢ for earth, 75¢ for loose rock and $2.50 for solid rock per cubic yard. I did not use these prices as I thought this a small hurry-up job, and I did not think them a good average, though the work could not have been done much cheaper.

I depreciated no items of schedule 3 and except retaining walls which were depreciated upon my personal inspection.

Schedule 5, Bridges, Trestles and Culverts, consists of steel, iron, concrete and wood structures. Steel bridges are valued by applying a price per pound in place; the wooden bridges by a unit price
1499 per thousand feet of timber in place. Page 1, of Pltf.'s Ex. 201, properly shows the bridges retired and added since 1913. In instances the additions are put in at actual cost (four instances) and in others on new unit prices. The unit prices used on bridges appear on sheet 12 of Pltf.'s Ex. 201. The $49 per thousand used for wooden bridges, consists of timber f. o. b. Superior per M. $32; freight 64¢, loading and unloading $1.50; labor, framing and erecting $15, total $49.14 per thousand. The Master used the same elements but I increased some of the base prices due to the increased cost of labor and materials. I simply attempted to bring appraisal values of 1913 down to date. In putting a new bridge in place of an old one, the charge to additions and betterments is the difference between the cost of the new and the value of the old bridge in use and in place. I merely took the bridges retired off the Master's list at his valuation and added the new bridges at the new values. I think the unit prices for bridges are fair and reasonable. The percentage of condition of schedule 3 was found by inspection and a study of the repairs and as the bridges have had four years' use the general effect is lower than the Master's percentage of condition.

Schedule 6, Ties: these are inventoried at so many per mile and the percentages to the total determined by inspection, as cedar 18%, hemlock 59%, tamarack 23%. That is a fair average of our ties. Additions and retirements were made as described. Unit prices for 1917 were taken from the Company's records and I used an average of 35.8¢, made up of cedar 41.72¢, hemlock 34.63¢, tamarack 34.35¢; the 35.8¢ was a weighted average. To this I added 9¢ per tie for hauling, loading and unloading but nothing for inspection. The Master added 6¢; my 50% increase is caused by the increased
1500 cost of labor, train equipment, coal, etc., I did not change the percentage of condition from the Master's 55%.

To the best of my knowledge ties were in practically the same condition in 1917 as in 1913. From June 30, 1913, to June 30, 1917, 54% of the Master's quantity of ties, or 725,976 new ties were put in on main line in Michigan. We replace ties when they get close to 50%. They could not be used longer as they decay and spikes won't hold. A tie is worth nothing after taken out. The normal condition would average 50%. I think the Master's 55% would be low enough and on account of the 54% of new ties put in; I left the condition as he found it. Eight years is about the life of such ties as are used on D. S. S. & A. Some will not last near as long and cedar lasts longer. An average of 6 years is about the life of a hemlock or tamarack tie. The average life of all the ties, including cedar, on the D. S. S. & A. is not over eight years.

Schedule 7, Rail, taking the Master's quantities, I deducted the retirements, applied unit prices and added the additions. The unit price was based on rail at Chicago, $38 plus the tariff rate to Marquette $2.25, transportation on our line 60¢, unloading and handling 30¢, inspection 10¢, total $41.25 per ton, which was applied to all tonnage of the line. I obtained the base price from the Purchasing Department. The rail is depreciated down to scrap value. I fixed $30 per ton for scrap which is a fair average or low. We sold some as high as $42.50 a ton in 1917. To arrive at percent of condition I used the Master's condition percentage as a basis and deducted 2.5% a year. I think that a fair average.

Schedule 8, Track Fastenings. We applied a certain number per mile of track to ascertain quantity. Where track was retired
1501 I retired the fastenings and where new rail was put in I put in new fastenings. The unit prices, stated on sheet 12 of Plt.'s Ex. 201, were obtained from records of bridges, consultations with other engineers and my own knowledge. I depreciated the same as rail allowing scrap value to a*b*gle bars only. Schedule 9, Frogs, Switches and Crossings, was handled and depreciated the same as track fastenings and I thought the 1917 price fair and reasonable.

Schedule 10, Ballast. The quantities are the same as the Master's except on branches retired and added. About 95 miles of the track has been reballasted but to be conservative I assumed that would make good depreciation and did not add it. The Master figured 9 inches for gravel and 6 inches for cinder ballast under the tie. The I. C. C. in 1916, made test pits, about one every mile, to ascertain the amount of ballast. In soft places, east of Marquette, through Seney Swamp, they found 18 to 24 inches of St. Ignace gravel below top of tie, on the average. I applied prices of 80 cents for gravel and stamp sand and 45 cents for sand and cinders per yard.

Schedule 11, Track Laying and Surfacing. This is a labor item including laying ties and rails and surfacing the ballast. I took the Master's mileage and increased his price 50%—$600 to $900 per mile.

Schedule 12, Fencing. I used the Master's quantities, added additional fence, deducted 10% from Master's condition and applied new unit price, based on cost in fall of 1916. In my judgment the

prices used represent a good average. The 10% I think sufficient depreciation.

Schedule 13, Crossings, Cattle Guards and Signs. I treated this about the same as fencing and increased the Master's price
1502 25% in some and 50% or 60% in other cases, based on my experience, on purchases and consultation with other engineers, of the cost of labor and material.

Schedule 14, Interlocking and Signal Apparatus. The additions and retirements in Pltf.'s Ex. 201 are correct.

Schedule 15, Telegraph and Telephone. I treated entirely as a labor item as the telegraph company owns all material and plaintiff constructed. I increased the Master's price 50% and reduced his per cent condition from 70% to 65%, using my judgment. We maintain the telegraph line and have spent sufficient to maintain it in practically the same condition as in 1913.

Schedule 16, Side Track. The price includes the grading and all track material in place. They include all tracks, except main line and traffic spurs. I used the Master's quantities for side track, deducted retirements and added additions. I applied the same unit price as applied to the separate elements entering into side tracks and reached a price of $6,850 per mile. The same per cent of condition was applied as on similar material in other track but ties were put lower, because of culls being used.

Schedule 17, Stations, Buildings and Fixtures. From the Master's inventory I deducted retirements and used the balance. There has been increase in the cost of building materials since 1913.

Schedule 19, Shops, Engine Houses and Turntables. This — handled the same as Station Buildings by applying additions and retirements to Master's valuation but making no recomputation of new unit prices. The condition was as good in 1917 as 1913.

Schedule 20, Shop Machinery and Tools. I used Mr. Fowler's figures having furnished him with the additions. The correct
1503 amount is $150,599 including additions of $4,903. This corrects an error in Mr. Fowler's figures due to an omission.

Schedule 21, Roadway and Construction Tools. I took the Master's quantities and conditions to reach 1917. They are being kept on an equally good standard as in 1913. I increased the values 60% due to increase in costs. Track shovels and tool steel have gone up 100% to 400%.

Schedule 22, Water Stations. Pltf.'s Ex. 201 correctly shows additions and retirements. Upon prices obtained by purchases of material and consultation with engineers I used for tank complete without pumping station $2,167.00. We constructed one in 1916 at a cost of $2,502.

Schedule 23, Fuel Stations. I valued these the same as for bridges, using new unit price, which I think a fair average. The additions and retirements are correct.

Schedule 26, Docks and Wharves. The figures were stipulated.

Schedule 27, Electric Plants. Additions are correctly shown. I added 50% to the Master's values for increased cost of labor and materials.

Schedule 28, Miscellaneous Structures. The exhibit correctly shows additions and retirements. There was no attempt to recompute the values. Considering increased cost and repairs the percentage of condition as good in 1917 as in 1913.

Schedule 29, Engineering on Roadway and Structures. I increased the Master's allowance 30% to cover increased cost of labor.

Schedule 30, Locomotives. I furnished Mr. Fowler the retirements and additions and took his values. I apportioned the value of
1504 locomotives to services upon information obtained from the movement of each locomotive in the time book. The plan followed was the same as in Pltf.'s Ex. 81. My apportionment was correct according to mileage.

Schedule 31, Passenger Train Cars, I furnished Mr. Fowler the additions and retirements and apportioned the value to Michigan on percentages furnished by Relf. The total before apportionment was $407,193.

Schedule 32, Freight Train Cars. What I did was the same as for passenger cars. For cars in service a part of the year I used an apportioned value based on time.

Schedule 33, Miscellaneous Equipment. Using the Master's unit prices for 1913 I increased the value in the same proportion as used by Mr. Fowler and depreciated according to the depreciation charged off on the Company's books. I think 2.5% per year; added items I put in at cost. Pltf.'s Ex. 201 correctly shows retirements and additions. They were proportioned to states on percentages obtained from Delf. The percentage of condition used was a fair average for June 30, 1917, and the prices are fair.

Schedule 34, Ferries and Steam Ships. The value was stipulated.

Schedule 35, Engineering on Equipment. The Master allowed 2% of all schedules 30, 31, 32, 33 and I increased his allowance 30% to 2.6%.

Schedule 36, Terminals. I increased the grading price only. I figured repairs and increased costs would maintain the Master's percent of condition.

Schedule 37, Contingencies; 38 Legal Expenses; 39 Organization and Administraiton; 40 Taxes, and 41 Furniture and Fixtures. Were included at the same amounts as allowed by the Master.

1505 Schedule 30, Interest During Construction. I applied the Master's rates to the new amounts arrived at by me according to his formula on pages 197-198 of his report.

Schedule 42, Stores and Supplies. For 1917 I took the average of the inventories for the fiscal years: 1914, $390,145; 1915, $326,113; 1916, $392,828; 1917, $571,980. The average used I separated to freight, passenger and common on the proportions of the inventory of appraisal attributed to each. Fuel varies greatly, being low in spring and much larger at the close of navigation. This year we have a large stock of track material on hand. The item was proportioned between states on the percentages of road miles.

Schedule 43, Working Capital. This represents monthly balances for four years, 1914-1917. I apportioned to Michigan on the basis of track miles.

The item Appreciation was taken as allowed by the Master and apportioned to services on the same ratio as Sch. 3, Grading.

The unit prices I used appear on page 12, Pltf.'s Ex. 201. I am familiar with prices of labor and material on our line 1914-1916. They were higher in all three years than used by the Master for 1913. As regards the extent of depreciation, the road was in better condition in 1914 as compared with 1913, in 1915 as compared with 1914, and in 1916 as compared with 1915. We have kept making improvements right along.

Cross-examination.

By Mr. Wykes:

Plaintiff's Ex. 201, was prepared exclusively for this case; it starts with the Master's value, then excludes retired property, then
1503 adds additions, then affects the quantities with 1917 prices. In some cases, where previously mentioned, I have used cost prices. The increases shown, due solely to price increases 1913 to 1917, is the difference between columns 2 and 3 and then subtracting the balance from Column 5, or approximately $3,130,714, with adjustments which will further increase due to stipulations, the Soo Bridge, depreciation, etc. For added property I have used cost price where mentioned. The actual cost price for all added property could be taken from the additions and betterments account. I understand the amount reported to the State as additions and betterments would be the amount of new property not paid for by operating expenses. I presume the cumulated figures from the reports 1914-1917 of net amounts of additions and betterments would bring the value down to date. The increase in grading of $1,000,000 due to increased price would increase the schedule, Interest During Construction, $90,000. Messrs. Young, Loweth and I, agreed 30% increase for Enginering During Construction would be right. I said the property in 1914 and subsequent years was in better condition than in 1913, because the maintenance was sufficient. The further depreciation where I allowed it was to be conservative. Notwithstanding I decreased some items, other items such as new and increased weight of rail would be on the up-grade and becoming better all the time. In those years we relaid considerable 60 Lb. with 80 lb. rail. The old rail was too light for the traffic; we have a lot more to change; we got new and heavier locomotives. In replacing 60 lb. with 80 lb. rail about 25% of the cost of the new rail would go to Additions and Betterments and 75% to Operating Expenses, regardless of the fact that the rail taken out was in a depreciated condition and had cost—say
1507 $30. I made no special investigation of increased prices of materials, comparing 1913 with subsequent years, but they are just my general idea. I do not know whether 1915 prices fell below 1914. I did not furnish Mr. Fowler the sales prices of locomotives retired and made no investigation of sales prices or amounts received for locomotives scrapped. I know the price of certain track material remained constant up to 1916. My tie prices used for 1917

were taken as the prices for that year. Averaging the four years back to 1913, the result would have been lower. The appraisal, Pltf.'s Ex. 201, as a whole would have been less for 1917 had the four years after 1913 been averaged. I added for no items omitted by the Master, Riggs or Hansel. I do not recall any but there might have been some. I did not find any omission of sufficient importance to mention.

I made the price of 40¢ for grading sufficiently high to cover the two items, Overhaul and Shrinkage. The 9¢ added to the average cost of ties of 35.8¢ covers hauling, loading and unloading charges. If the I. C. C. rule includes unloading in track laying and surfacing, that would already be taken care of in the prices allowed and that is true also of hauling and loading.

The work on the Negaunee and Palmer Branch mentioned was by contract but not on bids and the job was submitted to but one person. Bids often vary 40% between the high and low, but it was hard to find any one to do the work that year. The country there was rough, the work confined to one big cut classified as earth, loose rock and solid rock and the haul 700 or 800 feet. The grading amounted to about $4,000 and was not done by steam shovel. I would not think the instance typical. The $900 per mile for track laying and surfacing was determined by Young and Loweth; I did not analyze its elements. For ballast increase I also took their prices. On bridges,
1508 the bridge at Brimley, in place 3½ years the conditions taken were: steel 98%, bridge ties and guard rails, 95%, and remainder of structure 100%. I started this bridge new and depreciated to be conservative.

The excavation and back fill of bridges we did not depreciate with the structure, though to replace it some of the work would be done over again. The cost of additions and betterments made since 1913 is in all instances materially less than the figures I have placed in 1917 values and in many instances as much as a 50% increase has been made. I have taken no structures at less than cost; ordinarily the depreciation I allowed is not enough to reduce the additions from the value included to cost. The inventory of stores and supplies would include those for the purpose of making additions and betterments as well as those for the purpose of maintenance. There is no way I can separate. Though some of the stores and supplies material has been used it is considered as good as new. The base prices for ties are the same figures as reported to the Railroad Commission. To their average I added 9¢ per tie. I understand the report prices include inspection only, but I do not know.

Redirect examination.

By Mr. Tracy:

In Pltf.'s Ex. 201, I took actual cost for each addition so indicated.

1509 NELSON CADERETTE, recalled.

Direct examination.

By Mr. Tracy:

The correct item for Schedule 31, Passenger Train Cars for Michigan is $333,584; for Miscellaneous Equipment $74,316.

Cross-examination:

The shops and shop property located in Michigan are used in repairing all the cars of the line and ail assigned to Michigan as being located there. The Thomaston water and fuel stations furnish water and fuel for locomotives running out of the state but they are all assigned to Michigan.

1510 NELSON CADERETTE recalled.

Direct examination.

By Mr. Tracy:

(Corrected copies of the plaintiff's (Fowler) Exs. 211, 211*a*, 212, and 213, produced.)

Pltf.'s Exs. 201*a*, 1914, 201*b*, 1915; and 201*c*, 1916, are computations to find the value of plaintiff's Michigan property based on the Master's valuation plus the additions and retirements in each year. I took the Master's values for 1913, deducted retirements at his depreciated value and added additions at cost,, where they were shown in Pltf.'s Ex. 201, or at the Master's unit prices where costs were not shown. That applied to all except the equipment schedules and for those I took Mr. Fowler's valuation. The retirements and additions shown are those shown on Pltf.'s Ex. 201. The divisions between passenger and freight and inter an intra state passenger were made by Mr. Delf.

In assigning the locomotives to states and services the 1913 locomotive mileage from the time books was used for 1914, 1915 and 1916, as that gave a less percentage to Michigan than 1917, would have done and we had no data collected for those years. The locomotive values given by Mr. Fowler were for such locomotives as were on the line in 1917 and for 1914, 1915-1916, I have added the locomotives in use at those times but since retired; I added these in at the depreciated values of the Master for the months in use only, e. g. for a locomotive in service in 1913 continuing to 1916, not valued by Mr. Fowler, I took the Master's values and depreciated it 2.5%.

(Pltf.'s Exs. 201*a-c* introduced in evidence.)

Cross-examination.

By Mr. Wykes:

1511 The figures used for additions from year to year are not the same as reported to the State Boards, which were used by the State in bringing its exhibits to date. They are computed by taking the cost where I could obtain it. I am not sure that would be the figure reported to the State. In other instances they were computed at the unit prices. I made such allocations of property as were made. In the division between freight, common and passenger I carried forward the divisions as divided in Pltf.'s Ex. 201. These exhibits are entirely assembled from Pltf.'s Ex. 201. In the preparation of Ex. 201 where I used unit prices instead of costs I was instructed to take that way as the costs were not available in the company's books in such a way that I could get at it. Many items of cost do not enter into our books at all, e. g. over head expenses.

Dedirect examination:

I did not take costs, in making up Pltf.'s Ex. 201, in making additions as I computed new unit prices according to the higher values of 1917. These amended exhibits 201*a*-201*c* were made within the past week.

1512 A. E. DELF, recalled; a witness for plaintiff, before the Court on Nov. —, 1917.

Direct examination.

By Mr. Tracy:

Age, residence and qualifications previously given.

Under the I. C. C. method of accounting when an old bridge is replaced with a new one, the cost of the new structure is charged to the capital account "Road." The ledger cost of the structure retired, if known, or the estimated cost if not known, is charged to operating expenses, the same amount is credited to "Road" and the salvage adjusted. If between 1913 and 1917 new bridges have replaced old ones, that would show up in operating expenses and additions and betterments.

Referring to Schedule 5, Pltf.'s Ex. 201, the expenditures on account of bridges, trestles and culverts, operating expenses (1914, $45,886) and additions and betterments (1914, $36,000+) would practically equal the aggregate amount specified as additions.

Where rail is replaced with new rail of the same weight the entire cost is charged to operating expenses and the same account credited with the value of the rail taken out, making no charge to road; if the new rail is of heavier weight, the difference in weight is charged to road and the remainder to operating expenses. Inventories as of June 30, each year, are kept of stores and supplies showing new

material at cost and old rail at scrap prices. The coal supply is lowest in June and highest at the close of navigation. We now (Nov. 1917) have on hand about $400,000 worth or 70,000 tons, but a small portion of which is represented in the 1917 inventory. It will be consumed before the inventory of June 30, 1918. The ties purchased during fall and winter are in greater part put into the track by June 30. The prices reported to the Commission included the ties along side the track and the inspection cost
1513 before they are moved. They are charged out of the material account when they are actually put into the track. The working capital figures furnished Mr. Caderette are the average monthly balances 1914-1917, not taking into account deposits in connection with this case. They include items accumulated for interest payments. We have had to use this reserve for operating purposes and to borrow money besides. As comptroller I find it necessary to have on hand for working capital the sum set forth in Pltf.'s Ex. 201.

1514 A. E. DELF recalled.

Values for equipment and other items shown in Pltf.'s Ex. 201 was apportioned between states, passenger cars on passenger car mileage; sleeping, dining and observation cars on their respective mileages; freight cars on freight car mileage, and miscellaneous equipment, stores and supplies and working capital on track miles of main line and branches. Ratios of road and car miles are found on page 1 of Pltf.'s Ex. 205. The division by me of Michigan common property between "passenger," and "freight" is shown on sheet 1 of Pltf.'s Ex. 201; Schedule 19, Shops, Engine Houses and Turntables, was divided into shops $50,067 and engine houses and turntables $168,679; shops were assigned to passenger and freight on the relation of repairs, to (308) locomotives and (314) freight, (317) passenger and (326) work cars, as shown on D4 of Pltf.'s Ex. 210, 29.26% to passenger. Account is kept of the expenses of repairs to the various classes of equipment and I divided the value of the shops themselves between passenger and freight on the relation of work done in them.

Engine houses and turntables were then subdivided to yard engines, 19*a* and road engines 19*b* on the relation of accounts 398 and 400; the amount assigned to yard was divided between passenger and freight, on the relation of the division of account 388 or passenger 2.09%; the amount assigned to road engines was divided on the relation of account 400, engine house expenses road, or passenger 30.02%.

Schedules 20, Shop Machinery and Tools, 42 Stores and Supplies, and 43 Working Capital, were all divided on the relation of the totals arising from the division of all other property schedules except 20, 21, 42, 43, 37 and 40—the overhead basis.

1515 Schedules 22, Water Stations, and 23, Fuel Stations, were divided on the basis of (*d*16) the fuel used in passenger and freight services as shown on page 8 of Pltf.'s Ex. 210. These

methods were to divide on the basis of the use made in the different services.

With the exception of the schedules above mentioned and 37 Contingencies and 40 Taxes, the common property was divided to passenger and freight on the modified revenue train mile ratio shown in Pltf.'s Ex. 210, p. 1. This ratio is made up on the one hand of (*a*) the revenue freight train miles, (*b*) the freight train switching locomotive miles on common tracks computed from time spent in switching, at six miles per hour; the amount of time spent on common tracks was made up on a series of tests by conductors in 1917 in which it was determined that 58.94% of the switching time of freight trains was on common track. The tests were with the cooperation of the defendants and the percentage agreed to; (*c*) the freight yard locomotive switching on common tracks, obtained by similar tests, the percentage being agreed to by state representatives.

On the passenger side there is (*a*) the Michigan revenue passenger train miles and (*b*) Michigan passenger train locomotive switching on common tracks, the proportion of time being obtained by tests agreed to by the state, plus (*c*) the mileage of C. & N. W. and C. M. & St. P. trains. These for 1917 gave a total freight train and switching miles of 1,080,134 miles and passenger train and switching of 788,806 miles, or a ratio of 42.41% for passenger of the total train and switch miles. This ratio for the division of common property between passenger and freight was used as it represents the actual use of property by the two classes of trains showing the relation by the respective mileages. The division ignores time weight
1516 and speed. The weight has nothing to do with the use of the property. In the case of a passenger train over 100 miles of track at 27 miles an hour followed by a freight train at 16 miles an hour each would have one complete use of the entire property. The theory is that the revenue train mile represents the unit of use without reference to the destruction of the property, that being taken care of in the division of maintenance cost. The switching done on common tracks only was used, as the ratio is used only to divide common property, the exclusive freight property having been allocated to freight service.

Schedule 37, Contingencies, was divided on the relation of the divisions of all other schedules except 1, 37 and 40; schedule 40, Taxes, was divided on the relation of totals of all other schedules except 1, 34, 36 and 40 Taxes. The details of the division of common property are shown on the right of sheet 1, of Pltf.'s Ex. 201. The Michigan passenger property was assigned to interstate and intrastate in the relation borne by the passengers carried one mile in each service to the total passengers one mile, or for 1917, 70.67% intrastate and 29.33% interstate, as shown on Pltf.'s Ex. 205, page 8. The total value of property devoted to Michigan intrastate passenger service is given as $3,935,976. (Pltf.'s Ex. 201 offered in evidence.) Pltf.'s Exs. 214-219 inclusive, are Interstate Commerce Commission classifications containing the rules, regulations and instructions by which the plaintiff's accounts are kept. (These exhibits received in evidence.)

Pltf.'s Exs. 202, 203, 204 and 205 are plaintiff's operating statistics used in the various separations of accounts for the years 1914, 1915, 1916 and 1917, respectively, being actual figures taken from the accounts and largely self explanatory. (These exhibits re-
1517 ceived in evidence.)

At the bottom of page 6 of Pltf.'s Ex. 202 "operating expenses" should read "passenger statistics," the rate per passenger per mile should read "cents" and results from the division of the total passenger revenue by the total passenger miles. This represents actual receipts including all classes of travel and mileage books and children.

On page 11 of Pltf.'s Ex. 202, the estimated loss by application of the two cent rate act was arrived at. We analyzed the traffic as to children and adults less than 5 miles, for 1910 and 1913 and it is agreed that the same ratio may be applied to subsequent years. We ascertained the amount that would be obtained by the plaintiff at two cents per mile, computing children at half fare, the trips of five miles or less at three cents and the excess over two cents to be obtained on certain interchange business at actual rates and the remainder at two cents per mile, which gave the amount which would be received on a two cent basis; this subtracted from the amount actually received on a three cent basis represents the loss of $131,299 on the intrastate business had the rate been enforced. We do not take into account any increase or simulation of business by the reduction of fare. All the statistics in Pltf.'s Exs. 201-5 (1914-1917) taken from our books, represent the operations of the road.

On page 15 of Pltf.'s Ex. 204, 1916, is a statement of the statistics of travel in Michigan on D. S. S. & A. sleeping cars, giving the number of passengers and passenger miles and revenues in business. They also show the details for foreign sleepers. The only revenue that comes from the foreign sleepers is the proportion of passenger fares, though we get a rental, as will be later explained. We get
1518 all the transportation revenue earned on our lines in those sleepers but none of the sleeping car revenue. We get a hauling charge from the C. & N. W. and C. M. & St. P. Pltf.'s Ex. 205, 1917, contains the same information as 204; Exs. 203-205 are taken from our books and correctly show the statistics they purport to show.

Pltf.'s Ex. 209 covers year ending June 30, 1917; pages 1-4 contain the operating expenses for the entire line and for Michigan and the passenger operating expenses in Michigan. Page 5 shows results of the passenger business in Michigan for that year including total income, expenses, rents, taxes and other payments, the net income, the deduction of the estimated loss and for mail and express and the final figures, the result of the operations if Act 276 had been made effective.

Describing page 1 of Pltf.'s Ex. 209: The first column headed "Account Number" shows the number of the account as designated by the Interstate Commerce Commission. The next column the title of the account.

The third column shows the amount of operating expenses assignable to each of the accounts for the entire line.

The fourth column shows the proportion of the operating expenses assignable to the State of Michigan.

The fifth column shows the proportion of those expenses directly assignable to passenger.

The sixth and seventh columns the portion of the Michigan operating expenses that are common to both freight and passenger, not directly assignable to either service.

The eighth column the percentage proportion of columns 6 and 7 that has been assigned to passenger.

The ninth column has reference to the division, showing how that percentage is arrived at.

1519 The tenth column is the amount of the common expense assigned to passenger.

The eleventh column is the sum of columns 5 and 10, or the total Michigan passenger operating expense."

The operating expenses of the railroad are divided into groups as follows: Maintenance of Way & Structures; Maintenance of Equipment; Traffic Expenses, Transportation; Miscellaneous Operations; and General Expenses.

Under maintenance of way and structures, page 1, Pltf.'s Ex. 209 in first column: "Operating Expenses Entire Line" there is no disagreement between me and the State's Accountants; in the next column "Operating Expenses in Michigan" there is a disagreement in that Mr. Parker assigns $1,986 less and Mr. Hillman $479 less to Michigan than I do. In assignment to states we have assigned the expense of the structure, e. g., Marquette shops, to the state in which located; due to a different theory they have not assigned all such expenses to Michigan. After obtaining operating expenses shown in column "Operating Expenses Michigan" the first step to divide between passenger and freight services is to allocate or definitely assign all that can be allocatably assigned. Referring to page 6 of Pltf.'s Ex. 209: to explain method adopted in 1917 to allocate maintenance expenses; in 1915 the I. C. C. required us to separate operating expenses between passenger and freight services as far as possible under rules in Pltf.'s Ex. 217; we did so and Pltf.'s Ex. 209, page 6, shows the result of the allocations and columns 5 of page 1, same exhibit, the result of passenger allocations; columns 6 and 7 on page 1 show common expenses which could not be allocated.

Instructions were issued to the various departments to make definite assignments to freight and passenger when making up

1520 their monthly expenses. In the case of the road maintenance, blue print books were made for each section, showing the tracks on that section as to freight, passenger and common, the common tracks being shown in white, freight tracks yellow, passenger tracks red. The section foremen were instructed each day to keep track of the labor and material used on each class of track and report it at the end of the month in their time books; turn the time books in to the department to compile the final distribution, and in those departments the assignment is made to the various services, freight, passenger or common.

Page 6, Pltf.'s Ex. 209, is a statement of the cost of the mainte-

nance of way and structures in Michigan, and the portion thereof definitely located to the maintenance of exclusive freight tracks and bridges in one column, and exclusive freight structures other than tracks and bridges in the second column of figures. The third column of figures shows the amount definitely located to exclusive freight structures other than tracks and bridges; the fourth column of figures the total cost of maintenance of exclusive freight tracks and bridges, and the fifth or last column, the total cost of maintenance of exclusive freight structures other than tracks and bridges.

This separation as to exclusive freight tracks, bridges and other structures was made to ascertain percentages to assign the 1914, 1915 and 1916 maintenance costs to exclusive freight tracks.

Q. Now, I will ask you whether the column footings $53,102 and $45,000 represent the amount of money as shown by the reports of the maintenance of way department which was spent in maintaining exclusive freight tracks and structures in the year 1917?

1521 A. With the exception of two of the accounts, 208 bridges, trestles and culverts and accounts 272, removing snow, sand and ice, they do.

Account 208, "Bridges, Trestles and Culverts"; in our assignments we had evidently overlooked the assignment of a bridge at Walsh's Siding to exclusive freight, and some other bridges that served two tracks, a common track and a freight track, had evidently been assigned to common, and portions should have been assigned to freight. Those errors were discovered by the accountants for the State and my attention called to them and the correction made. In the account "Removing snow, sand and ice," the assignments were made in accordance with instructions by the section men. When the accountants for the State went into the detail of it, they questioned its accuracy, calling special attention to the assignment to the Marquette yards. I do not know that there was any reason to doubt the accuracy of the assignment and the result, I do not think, represented the true condition. For instance, the main line running through the Marquette yards has leading off from it numerous freight spurs. Under the instructions, very naturally the section foremen would report that main line as common track, but a large portion of the snow shovelling of the common track would be cleaning out frogs and switches leading off from it to the freight spurs, and therefore, really would be freight—assignable to freight service rather than the common track, and it was agreed between the accountants for the State and myself that we would adopt an arbitrary assignment of one per cent of the total of that account for passenger, 29% for freight and the balance assigned to common, which was done in this year and in each of the other years, 1914, 1915 and 1916.

1522 Except for these two accounts the figures on page 6 of the Exhibit show the actual allocations to the extent as made by our maintenance force.

The next, fourth column, totaled $56,123, has opposite one or two accounts matters which was not in the preceding account; account 201 could not be definitely assigned to either service; it is all common. Account 269, "Roadway Tools and Supplies," the same; Ac-

count 271, "Small Tools and Supplies," the same; Account 276, "Stationery and Printing," the same, and 277 "Other Expenses," the same. These five accounts are all common, but a portion of the expense of those accounts should be assigned to the cost of the exclusive tracks, and they have been assigned by me on the overhead basis.

Q. And the relation of that portion of the expenses is allocated to the exclusive freight structures and tracks as compared with the total expense?

A. The total Michigan expense, yes, excluding those accounts.

In accordance with I. C. C. rules, effective July 1, 1915, we began to make assignments of track work expenses in Feb. 1916, and to June 30, 1917, definite assignments were made. We did not find the expenses of maintenance of exclusive freight tracks for other years than 1917; it was mingled in one account and was not allocated or separately reported. We therefore took the percentages which the assignments for maintenance of exclusive freight tracks in 1917 bore to the total maintenance of each of the accounts and applied that percentage to the total of the like accounts in 1914, 1915 and
1523 1916. This appears on page 7 of Pltf.'s Ex. 209. For example, Account 212, Ties, the total Michigan expenses in 1917 was $60,335, and the exclusive freight tracks portion $8,893 or 14.74% of the total. In 1916 the total tie expense was $56,379, of which we assigned 14.74% to exclusive freight and the same for 1915 and 1914. This is typical of the way assignments were made for all other accounts.

On Pltf.'s Ex. 209, the common expenses were assigned to passenger and freight, those under the caption "Common" in column (1) being upon the modified revenue train mile basis, and those in column (2) on other bases. Accounts 231, Water Stations and 233, Fuel Stations, were assigned on the relation of fuel consumption in the two services shown in Division 16. (Page 8, Pltf.'s Ex. 210.)

Account 235, Shops and Engine Houses, was divided on division D 17, shown on page 9 of that exhibit. The shop part of the expense being assigned in the relation of the equipment repair accounts—division D4—and the engine house expenses on the relation of Accounts 388 and 400 being the yard and train engine house expenses.

Account 275, Insurance, is assigned on Division 18, according to the allocation of the property on which the insurance is paid.

All other expenses under caption "Common" (2), are assigned on division 2, page 1, Pltf.'s Ex. 210, which is overhead to or in relation of, the totals of the division of all other accounts in the maintenance of way and structures group, except 201, 244, 269, 271, 274, 276, 277, 278, 279. Pltf.'s Ex. 209, page 6: the division into columns shown is not with reference to 1917 but to ascertain the ratio
1524 or total to each account that the maintenance of exclusive freight tracks was in 1917, to obtain a ratio to apply to 1914, 1915 and 1916, where we had no ratio.

Pltf.'s Ex. 219, is a track chart of Houghton division. I have found three minor errors in this, two uncorrected. The two uncorrected affected 1.85 miles or between 1 and 2% of the total freight track mileage and the effect is to increase the amount I have charged

to maintenance of exclusive freight tracks between $500 and $1000.

Ratios D16, D17 and D18 used in dividing certain common maintenance of way expenses between passenger and freight were adopted and used to divide the repairs of water and fuel stations in the relation of the passenger and freight uses of the properties, making a direct connection between the use and the repairs and dividing the repairs directly in accordance with the use. Repairs to shops and engine houses were divided in the relation that the repairs to the equipment in each service bore to each other or the total and adopted because I was able to find the use unit.

The greater portion of the common maintenance of way and structures expense items which were divided on the modified revenue train mile ratio (D1) are due to weather or the elements and that portion of the expenses should properly be assigned to passenger and freight on the use of the property by them. The balance of the expense must be divided, and while I am aware that freight trains are longer and contain more cars than passenger trains, my opinion is that owing to the greater speed of the passenger train and the track refinements required for it, the fact that in some of our passenger trains our heaviest engines are employed, and that the removal of sand, snow and ice on the common tracks is necessitated by, and causes more expense due to, the passenger than the freight service,
1525 these reasons offset the fact that the freight trains are longer and heavier and contain more cars than the passenger trains.

The locomotive ton mile method has, in a number of instances, been used to divide common maintenance of way expenses. It is the weight of the locomotive and tender load multiplied by the number of miles run. The reason for its use is that it is claimed that the great destructive element of the train is the locomotive. I have investigated the locomotive ton mile ratio as applied to plaintiff. The passenger percentage, as compared with the modified revenue train mile ratio would be:

Year.	Locomotive ton mile.	Modified revenue train mile.
1917	43.9%	42.31%
1916	46.7	44.63
1915	50.+	48.65
1914	48.2	45.09

(The correct locomotive ton mile ratio apparently excludes the tender.)

On the maintenance of way and structures expenses for 1917, Parker's assignment to passenger is $89,000 less and Hillman's $74,000 less than assigned by me. This is due principally to my division of items on the modified revenue train mile ratio (D1) and to their allocation of expenses of exclusive freight tracks by setting off 17+% of those items to such tracks. Those two differences account for the greater part of the difference between us.

Under maintenance of equipment expenses, Pltf.'s Ex. 209, page 2: there is no difference between myself and the State's Accountants in the total of the first column "Operating Expenses Entire Line."

Parker assigns $225 less and Hillman $190 more to Michigan than I do. On the total amount assigned to passenger Parker's figures were $3100 less and Hillman's $2600 less than my assignment.

1526 The difference is due to the assignment of work equipment-repairs, that item having been divided by each of us on the ratio of maintenance of way and structures accounts and we varied on those divisions.

Under traffic expenses both parties are in accord throughout.

Under transportation expenses, both parties are in accord on the first column "Operating Expenses Entire Line." In the operating expenses assigned to Michigan, Parker's figures are $5,800 less and Hillman's $4,800 less than mine. In general the difference is due to assignments in Accounts 392, Train Enginemen, and 401, Trainmen. My method was: in 1917 Account 392, automatically assigns itself to freight, passenger and mixed service and the wages of engine men who run wholly in Michigan, are assigned to Michigan. On the four trains running in two states the wages of enginemen were assigned by me according to the miles run in each state. The same general explanation applies to Account 401. On account 394, Fuel for Train Locomotives, there is a difference of about $200. In the last column, page 3, Pltf.'s Ex. 209, "Total passenger operating expenses," Parker's figures assigned $25,600 less and Hillman $24,900 less to passenger than I did. About $21,000 of this difference is due to Account 373, "Station Employees." My method was: the allocations to passenger, freight and common were agreed to. The common was assigned by me on ratio D6, which is self explanatory and gave for 1917 37.31% to passenger. It is difficult to determine a ratio to divide common expenses of station employees. In the smaller stations there is usually one or two men whose services are in both passenger and freight work and it is impossible to determine accurately the amount of

1527 service devoted to either. The revenue train mile indicates the trains over the track and the number of times each class of trains enters or passes the stations. I have added the switching miles on all tracks to put the full proportion onto the freight. In Account 376, Station Supplies and Expenses, a difference exists and I have divided the same way as Account 373. On Account 372, dispatching trains, the State's figures are about $2,000 less than mine. I divided on ratio D6, the same as for Station Employees, that being train miles, plus switching. If the accounts Station Employees, Stations Supplies and Expenses and Dispatching Trains was agreed upon there would be little difference in the total of transportation expenses assigned to passenger. Under group "Miscellaneous Operations," added to the classification in 1915, there is no difference between the parties. Before 1915 these items were carried as the Account "Outside Operations."

Under the group "General Expenses" page 4, Pltf.'s Ex. 209, there is no material difference between the parties, Parker's figures in the second column being $350 less and Hillman's $180 less than mine. I excluded from 454 "Law Expenses" the expenses of this litigation. In the column "Total Passenger Operating Expenses"

Parker's figure was $3600 less and Hillman's $3300 less than mine, due to the theory of dividing that account "Overhead" to all the Company's expenses. My ratio is D14, page 8, Pltf.'s Ex. 210, for 1917 31.06% passenger. The total difference between the State's accountants and myself as shown by the summaries for 1917 are: in the column "Operating Expenses Entire Line" none; in column "Operating Expenses Michigan," Parker $8,400 less, Hillman $5200 less. In column "Total Michigan passenger operating expenses." Parker $122,000 less and Hillman $107,000 less than mine.

1528 The principal differences are those shown in the maintenance group and in the three accounts of Transportation Expenses.

Plaintiff's Ex. 209, page 5: There is little difference between the State's accountants and me on the revenue accounts they bring in. It is $306 in the account "Hire of Equipment." They do not bring in as revenue accounts mail, express, sleeping, dining and chair car revenues. The interest included does not include that on the "rate case fund."

Plaintiff's Ex. 210, page 13: This shows division of passenger expenses to intrastate and interstate services, though some percentages are omitted.

Accounts "Outside Agencies" and "Advertising" under "Traffic Expenses" were assigned by stipulation, and the parties agreed. "Station Employees" and "Station Supplies and Expenses" were assigned by me 88.70% to intrastate on the relation of the number of passengers carried interstate and intrastate, regardless of the distances traveled. The number of intrastate tickets sold at these stations is far in excess of the proportion assigned in this to intrastate by me. So far as wages and expenses of station employees and the station supplies and expenses are concerned, it does not make any difference the length of journey the passenger has taken or is about to take when he uses those stations. I have divided on the relation of the passengers traveling, rather than on the miles traveled. The property in the stations was divided on the passenger miles, or 70.67% intrastate as against 88.70% used for station employees. All expense of Soo Bridge operation is assigned to interstate.

Accounts "Operating Sleeping Cars" and "Sleeping Car Repairs and Depreciation" were porportioned on the miles of passengers traveling in D. S. S. & A. sleepers, as shown on page 14, plaintiff's Ex. 205, 33.28% to intrastate. The remaining passenger expenses were divided on the basis of the passengers one mile in the entire intrastate service, or 70.67% intrastate, shown for 1917 on page 8, plaintiff's Ex. 205.

1529 Plaintiff's Ex. 209, page 5: In column "Intrastate" totaling $733,049, my revenue figures are the same as those of the State accountants, except Mail, Express, Sleeping, Dining and Chair Car revenues, which they do not bring in, and the Hire of Equipment, where I have assigned $1,945 and Parker $1,731 to intrastate. In the item "Rents Paid for Hire of Equipment" I assigned to intrastate $1,165; Parker assigned $294; he excludes rental paid for sleepers, which I include.

The method of ascertaining the taxes paid to Michigan for each year is shown on page 12, plaintiff's Ex. 210. In actual accounting,

the taxes are carried ahead as an estimated amount, and charged up each month. Looking back, I would say that taxes would be more than I estimated for 1917, as I used the basis of $187,000, and Michigan taxes have been about $200,000. The taxes are assessed against the railroad as a whole, and were divided between services in the proportions in which the property was divided, first deducting Schedules 34, Ferries, and 36, Soo Depot, which are separate corporations, paying their own taxes. This assigns 31.03% of the taxes to the passenger service. The passenger result was then divided to interstate and intrastate on the passenger miles.

Plaintiff's Ex. 209, page 5, shows the net income, deduction of the estimated loss, and the mail and express loss, and final results.

It was stipulated between the parties that, for the purpose of preparing exhibits and showing operating statistics to be used on this hearing, 10.92% of the total Michigan operating expenses would be considered as due to the mail and express business. Taking this percentage, which was that adopted by the Master, this business in
1917 would show a loss of $6,159. The division between inter and intrastate is purely arbitrary, the revenue and expenses
1530 being divided in proportion to interstate and intrastate passenger revenue and expenses respectively.

1531 DELF.

Direct examination continued:

Pltf.'s Ex. 206 (1914) is the same as Pltf.'s Ex. 209 (1917), except that it applies to operations of 1914; 1914 is under the old I. C. C. classification and 1915-1917 under the new; the groupings of expenses are substantially the same under both classifications. In 1914 we did not have in the books expenses attributable to exclusive freight track maintenance. We were able to separate for freight, structures. The amount directly assignable to freight does not appear on Pltf.'s Ex. 206. The assignment of the passenger proportion of common expenses of maintenance of way was made in substantially the same way in 1914 as in 1917. The column "Operating Expenses" includes expenses of maintenance of exclusive freight tracks. Column "Total Michigan Operating Expenses" is excessive to the extent that it includes a part of the expenses of maintenance of exclusive freight tracks. After making this assignment we deduct the excessive amount from the total obtaining the amount as shown on page 7, Pltf.'s Ex. 209. After having ascertained the cost of maintenance of exclusive freight tracks in 1914, at $47,720 I deducted from the total Michigan passenger expenses 45.09%, of that or $21,517, which was the proportion of expenses assignable to passenger under division D1 in 1914. The proper method would have been to deduct the whole $47,720 from common expense item by item before the division, but the same result is arrived at by subtracting the later. The deduction is in fact excessive by the difference between 42.39% and 45.09%.

The differences between the State's accountants and myself on the figures in Pltf.'s Ex. 206, are:

Page 1, first column, none; second column in totals, Parker shows

$5,401 less and Hillman, $15,094 less than I do. This
1532 is due to my allocating all expenses of maintenance of structures located in the State of Michigan and their having adopted another method. In the last column "Total Michigan Passenger Operating Expenses," Parker's figures are $97,000 and Hillman's $82,600 less than mine due principally to (*a*) the different method of ascertaining the maintenance expense of exclusive freight tracks, and (*b*) to their dividing common expenses on a different ratio. The differences in theory in the accounts of 1914, are substantially the same as in 1917.

On page 2, Pltf.'s Ex. 206, the differences in maintenance of equipment between us are: first column, none; second column, substantial agreement; last column, Parker $1,847 less and Hillman $1,371 less than mine.

The difference is due to the assignment of work equipment-repairs, overhead to the maintenance of way and structures expense. On traffic expenses we correspond *col*sely. Under transportation expenses page 3, Pltf.'s Ex. 206, the differences occur in substantially the same accounts as in 1917 and are: first column none; second column, Parker $300 less and Hillman $3 less than mine; last column "Total Michigan Operating Expenses," Parker $23,600 less and Hillman $22,900 less than mine, the difference being largely due to assignment of accounts 63, Station Employees, and 68, Dispatching trains, also 66, Station Supplies and Expenses. The differences under "General expenses," page 4, Pltf.'s Ex. 206, are: in first column, none; second column, Parker $296 less and Hillman $487 less than mine; in last column, Parker $5,200 less and Hillman $4,100 less than mine, the differences being due to the making of the assignment of general expenses as overhead to preceding accounts.

1533 In the 1914 passenger revenue, page 5, Pltf.'s Ex. 206, the difference from the State's Accountants are: in total Michigan passenger revenue, none. In other items down to taxes, all in the first column, are the same except operating expenses.

The 1914 method for assigning taxes to passenger are the same as for 1917 based upon the valuation of the property. Passenger operating expenses are divided between intrastate and interstate in 1914 in the same way and with the same ratios as in 1917, and the estimated passenger loss and mail and express results were computed in the same manner. Pltf.'s Ex. 207, page 1, shows accounts for 1915. The method of setting off exclusive freight track maintenance is the same as for 1914. In the maintenance of way and structures group differences between myself and the State's accountants are: first column, none; second column, Parker $211 more and Hillman $259 more than mine; last column, Parker $76,760 less and Hillman $59,800 less than my assignment; the reasons for the differences there are substantially the same as in 1914 and 1917.

Under the maintenance of equipment group the differences are: first column none; second column, "Michigan Operating Expenses," Parker $20 less, and Hillman $107 more than mine; last column, Parker $1510 less and Hillman $970 less. Reasons the same as for 1917. Traffic expenses, no difference. Transportation expenses, first column, none; second column, Parker $30 more, Hillman

$1,070 more, last column Parker $23,000 less, and Hillman $22,800 less. The differences are due to the same reasons as in 1917. Miscellaneous expenses show no difference. General expenses, first column, no difference; second column, Parker $830 less and Hillman $710 less than I. Last column Parker, $4,880 less and Hillman $3,680 less. Due to the same causes as in 1917 and 1914.

1534 The differences in the summary for 1915 are: first column, none, second column, Parker $615 less, Hillman $728 more; last column, Parker $106,163 less and Hillman $87,305 less than mine. In the summary Parker's totals were $106,163 less and Hillman's $87,305 less than mine.

On page 5, of Pltf.'s Ex. 207, the differences in first column down to taxes, are: in "rents received for hire of epuipment" Parker $237 more, in "interest" $110 more than mine. On "Rents Received for Joint Facilities," Parker assigns part of the amount to the Mineral Range operations under joint facilities; excluding the Mineral Range the difference is $1,478; on "Rents Paid for Hire of Equipment," Parker assigns no portion of the rent paid for sleepers and the difference is $1,286. The operating expense item and the taxes are different. I apportioned taxes the same as for 1917. In the column headed "Intrastate" Parker assigns no mail, express, sleeping, dining or chair car revenues, to intrastate and the "Rents Received for Hire of Equipment, Joint Facilities" and "Interest" differ owing to the total Michigan differing. The estimated loss for 1915 and the mail and express division was arrived at for 1915 as for other years.

Pltf.'s Ex. 208, operations of 1916: in maintenance of way and structures group, the maintenance expenses of exclusive tracks was arrived at in the same manner as for 1914 and 1915. In that group the differences between me and the State's Accountants are: first column, none; second column Parker $3,340 less, Hillman, $1,644 less due to the same causes as for 1915. In the last column the differences in totals are: Parker $76,900 less and Hillman $53,900 less, in general due to the same reasons as for 1917.

In maintenance of equipment group the differences are: first column, none, second column, Parker $200 less; Hillman $210

1535 less; the last column Parker $1,800 less, Hillman $1,380 less due to same causes as in other years. In traffic expenses there is no difference.

Under transportation expenses the differences are: first column none, second column, Parker $3,200 less, Hillman $2,580 less than I, being substantially the same differences as in 1917. In the last column, Parker's figures are $21,164 less and Hillman's $20,655 less than mine.

Under miscellaneous operations our figures agree throughout. Under general expenses, the differences are: first column, none, second column, Parker $170 less and Hillman $100 less.

Column "Total Michigan Passenger," Parker $3,933 less and Hillman $2,655 less than mine.

In the summary, second column, Parker $6,838 less, Hillman $5,530 less.

Total Michigan passenger, Parker's figures $103,877 less and Hallman $78,675 less.

Page 5, Pltf.'s Ex. 208 was prepared in the same way and shows the same things as the other similar exhibits.

Pltf.'s Exs. 206, 207, 208, and 209, were prepared from our books of accounts and operating statistics and the calculations are properly made. (The exhibits were offered in evidence.)

In November 1916, the basis on mail pay was changed, reducing our mail revenue from $72,000 to $42,000 per annum. I believe from my study of the question that there will be a loss as estimated if Act 276 is put into effect. In 1914 the increase in Michigan passenger revenues was governed to a large extent by the copper country strike from July 1913 to February 1914. Upon closing the copper mines many miners got out of the country and went
1536 to other points on the South Shore, strike breakers and state troops were taken in and there was a large traffic back and forth during the strike. In addition they had a prosperous year in all lines of business.

The total operating revenue of the line for three months ending Sept. 30, 1917, as compared with the same period in 1916, shows an increase in revenue of $166,700, and an increase in expenses of $228,400. I have not the Michigan figures nor have I divided between passenger and freight. I have taken from the reports of the Michigan Railroad Commission various operating statistics for the fiscal years, ended June 30, as follows:

Michigan Passengers Carried One Mile per Mile of Road.

R. R.	1911.	1912.	1913.	1914.	1915.
Mich. Cen.	197,732	203,968	214,246	226,881	222,795
G. R. & I.	159,075	161,987	169,722	175,639	164,541
D. S. S. & A.	74,721	72,238	77,327	88,524	67,493

Passenger Train Revenue per Mile of Road.

Mich. Cen.	4,751	4,842	5,344	5,662	5,626
G. R. & I.	3,370	3,461	3,716	3,896	3,729
D. S. S. & A.	2,199	2,068	2,194	2,458	2,027

Tons of Freight Carried per Mile of Road.

Mich. Cen.	1,402,869	1,388,946	1,639,858		1,400,755
G. R. & I.	738,139	698,869	767,457		676,739
D. S. S. & A.	401,204	399,888	426,915		367,355

Freight Revenue per Mile of Road.

Mich. Cen.	8,862	9,338	12,653		10,019
G. R. & I.	4,854	4,899	5,345		4,931
D. S. S. & A.	3,587	3,639	3,894		3,144

1537 *Statement of Coal Cost in Sept.*, 1917, *as Compared with Sept.*, 1918.

Year.	Tons.	Cost per ton.	Total cost.
1917	3300	$5.65	$18,648
1916	3129	3.05	9,543

I understand the 1917 coal is not as good as last year. Our reported prices for ties consists of the amounts we paid contractors to get out the ties plus the cost of inspection only.

Cross-examination.

By Mr. Wykes:

In order to compare our statistics with those of the other roads enumerated, the proper elements to determine the value of the comparison would be: comparative cost of construction per mile and comparative cost of maintenance and operation. I do not think it would be necessary to know whether these particular companies are carrying at the two cent rate with a considerable profit or not. I did not investigate the extent of their profit. The tabulation is to indicate that other companies carrying passengers at two cents a mile are in a better condition to do so than the South Shore, as they have a greater traffic. The indication is that if the plaintiff makes a profit out of 67,000 passengers per mile the Michigan Central makes an excessive profit out of 222,000 passengers per mile.

As bearing on working capital, plaintiff has one fund from which it draws current funds for use in carrying on the railroad business; the money is in the bank subject to the check of the treasurer and would bear the burden of paying interest, etc.

Schedule 19 on Pltf.'s Ex. 201, is shops, located in Michigan but used to repair the equipment worn out on the entire line regardless of place. While freight equipment may be repaired at Superior we have no shops to balance the shops in Michigan. I have assigned no part of the property in shops or of the expenses of their maintenance or taxes outside of Michigan.

1538 The general practice in the appraisal has been to assign to Michigan, property there located, though engaged in serving the business of the entire line; the same is true of the expenses of maintenance of the property.

Schedule 42, Stores and Supplies, were assigned on a road mile basis made up of mileage of main line, exclusive — freight track and traffic spurs on the theory that they are necessary for use in the maintenance of the road. Due to the fact that 66 miles of the traffic spurs fall in Michigan and a less proportion to main line in Wisconsin, and that the ratio of maintenance of exclusive freight track to main line is about as one to three, there possibly should be an adjustment for that item of mileage. The same thing may be true to a greater or less degree of miscellaneous equipment, and which

is assigned on the basis of road mileage and used in the repair and maintenance of the line. It is not necessarily true of working capital as that represents all the traffic moved off the spur tracks.

On Pltf.'s Ex. 209, page 1, the second column headed "Operating expenses, Michigan" differs from Parker's and Hillman's in part because of my making no assignment of items in Michigan used in the common service of the line to business outside the state, together with differences arising out of those in applying overheads. I do not know what per cent my operating expenses shown in this column should be reduced if such assignment were made. I think the Master made this assignment on the road mile basis. After finding the Michigan expenses, my next step was to allocate as far as I could to services. While my tabulation shows what was allocated and assigned to passenger it does not show what was allocated and assigned to freight, though it might be computed from the exhibit. We did set off a certain amount to exclusive tracks in 1913—we made a guess at it assuming the cost of maintaining a mile of main
1539 line was three times the cost of maintaining a mile of side track; that the cost of maintaining a mile of exclusive mine freight track was $375, the cost of maintaining a mile of industrial spur freight track was $300. We equated the mileage of the side tracks by dividing by three, added the resultant to the total main line mileage; then we took the total maintenance cost and deducted from that the cost of maintaining the industrial tracks and the mine tracks to get at the cost of maintaining the main line and the sidings. We divided that result by the equated mileage of the main line and sidings to get at the cost per mile of maintaining the main line and sidings; then we applied that cost to the equated side tracks freight and passenger, and added to that the cost of maintaining the exclusive mine tracks and industrial tracks and took that as the total cost of maintaining the exclusive freight tracks.

We based a three to one equation on the testimony of Messrs. Lytle, Young and other witnesses. It resulted in assigning about 12.5% of the total maintenance cost to exclusive freight. Under our present method we assign to exclusive freight 1916, 8.63%, 1915, 7.83%, 1914, 8.42%, taking the total Michigan cost and comparing with the total freight cost.

For 1917 the separation of exclusive freight track expenses was based upon investigations under the I. C. C. order of 1915. We got the system in operation for the year 1916 and used the blue print, Pltf.'s Ex. 219. This method did not result in as much expense being assigned to exclusive freight track maintenance as testified to by Lytle, Young and others, though it does not necessarily disprove their claims. The effect of the previous method was to attribute to the exclusive freight tracks a portion of the expense of structures not located on those tracks. There is nothing on the blue print (Ex. 219) to indicate that any part of the expense of
1540 the maintenance of the switch as it intersects the main line is to go to or with the exclusive property, which makes it necessary. I do not think the blue print (Pltf.'s Ex. 219) in the hands of section-men might indicate that the switch might go with the

main line. I think the instructions in another book take care of that. I should say when he put- in a switch leading off to a freight spur his instructions are to report material used in the freight spur as freight, and it was intended that he should put it in the freight column. Our section-men are about the average of intelligence for that class of labor. I think they endeavor to do the best they can. In the instructions (Defts.' Exs. 335-336) on page 3, the heading "Used for Repairs" is divided into three columns "Exclusive Freight Tracks," "Exclusive Passenger Tracks" and "Common Tracks." The instructions are plain. The front of the red cover, reads under the heading "Used for Repairs"; "Enter opposite each article the quantity of material actually used for repairs during the month on account of ballast, ties, etc. Particular care should be taken to enter in the proper column materials used on exclusive freight, exclusive passenger, or common track.' The section men must know which the exclusive track is and what the instructions are, and he would then be able to make proper distribution. The blue print, Pltf.'s Ex. 219, indicates which tracks are designated as freight. The section man would know what freight tracks, including the frog joining it to the main line, was freight track. None of our men were told the point in main line to which the exclusive freight track should go. I do not think blue print, Pltf.'s Ex. 219, misleading, the section man would know where the track began and ended. There may be difficulty at times in telling what is exclusive and what is common track.

The switch runs into the common property where it joins
1541 the main line and, as to whether instructions should have been more detailed, I think too voluminous instructions do not get as good results as when you make them short and leave it to the common sense of the man doing track work all the time. There is no way of testing out the reports of the men in labor and material used in maintenance of exclusive tracks, except by doing the work over again, every other means is a guess. As to whether divisions of expenses between exclusive freight and common, and between freight and passenger are arbitrary, and in the nature of guesses, I would say arbitrary divisions must necessarily be matters of opinion to large extent. If the man has had experience in the work and of the operations in which he is making estimates they are not all together guesses. Mr. Lytle's estimate of a 3 to 1 equation for certain kinds of track, $300 a mile for another kind, and $375 for another, might have been all right, but the error would occur in our application of it.

In speaking of the reason for the differences in the amounts assigned to Michigan for transportation expenses by myself and by the State's accountants, I did not separate the trains crossing the State line from Thomaston west and divide on the mileage of trains. Each engineer's time is kept separate and the engineman who ran only in Michigan his entire time was assigned to Michigan. The enginemen who run in two states their wages are assigned between the states on the mileage of the runs in each State. The run of the enginemen into Wisconsin began at Thomaston usually. The enginemen are required to report for duty a certain length of time before they take their trains. If there is waiting time at the beginning or end of the

run, my method would not necessarily charge Michigan with too much of the expense because the same thing occurs at the other end of the line. The waiting time would be divided between the
1542 crews on the miles run and Michigan would get its entire end for the short haul, Thomaston to the State line; Wisconsin would get its end as against a much longer haul.

I divide dispatching trains under transportation expenses, between passenger and freight on formula D6, train mileage plus all switching. In making my divisions I have proceeded upon the theory that the time of the dispatcher's office and the expense of dispatching trains relates solely to trains and switching. They do send general messages for the operation of the road. I also divide the common portion of station employees upon ratio D6, train miles plus switching. At six stations—Sault St. Marie, St. Ignace, Marquette, Negaunee, Ishpeming, Houghton and the Marquette Ore Dock Agency—we were able to allocate a considerable amount of the station employee's expense. The difference between myself and Parker and Hillman is that they divide the common portion of that item on the basis of the allocated amounts. The common portion of the item is made up almost entirely of stations other than those I have mentioned. They assign the common stations other than those mentioned, on the relation of the allocations at stations which have no connection with the other stations though they are all embraced in the same account.

For each year I have used the modified revenue train mile division for the larger part of the common expenses; that accounts for a large part of the difference between myself and Parker and Hillman. Originally—in the earlier years—we divided the items which I now divide on the modified revenue train mile ratio upon the straight train mile ratio. We had made that assignment for use for statistical purposes from 1890.

We took that ratio, that we had been using for years, and applied it. I do not know whether there is any other ratio that would give a larger proportion of expense to passenger. This was the
1543 ratio used by the principal roads of the United States for that same division; it was used for a long time for comparative statistical purposes; we had used it for such useful purposes as we thought proper—for comparative statistical purposes. The present modification of the revenue train mile basis is to take into it a certain proportion of the switching and stational mileage. It assigns to the passenger service a greater proportion of expense than the straight revenue train mile ratio plus switching or my ratio D6. D6 made up of the revenue train mile plus switching takes in switching on exclusive tracks and we are only trying to divide expenses on common tracks. Locomotives running light are not included in the train mileage, though they would have the same protection from the dispatcher's office as a train and would perform a complete operation over the portion of the track they used. A large proportion of the engines running light would be in freight service. I made no modification to take into account the load behind the locomotive or the greater number of cars in one service over the other. In passenger trains the average number of cars in passenger trains is 4.7, and in

freight trains 20 to 22.5 (1916-1917). I have made no adjustment in my ratio, between the time I first prepared it and the present, to take into account the increasing length of freight trains during the period intervening between its first preparation and the present. There is no modification to take account of the different character of equipment in the two services—the less perfection of equipment in freight and the greater perfection in passenger service. The ratio is not modified at all; the actual mileage is taken and used, except for the use of the portion of switching on the common tracks.

In setting off exclusive track switching we required the reports from train men intended to set forth the amount of stational work or switching on common tracks and on exclusive tracks. We
1544 required the freight conductors to show the total amount of switching at various stations; the amount on exclusive track; the amount on common track and the location of the train during the switching. The reports show that the train was left on the common track the major portion of the time. I have not computed the percentage to know that it was 97% of the time. In computing the modified revenue train mile ratio I did not in any way give effect to the use of the common tracks by the trains standing on it during 97% of the time, when the rest of the train was engaged in stational work. In the two columns relating to the time of switching on common track and on exclusive track, we instructed the conductors to report the time engaged in switching, without any reference to standing time.

We asked no separation between standing and moving time, I assume they reported what we asked—the time engaged in switching. No division was made of the standing time and moving time in the switching operations. Not having the standing time we could make no such division. While they were unloading freight at a station I do not think the standing time would be included in switching time, though I do not know personally. The reports will show whether the switching time on common and exclusive tracks equals the total time spent at the station. Originally plaintiff's proofs showed about 39% on the average, of the time of freight trains as engaged in stational work. That was largely estimated, being testified to by each train conductor for his train and was then mathematically computed from the testimony. To get the present modified ratio that 39% has now in effect been reduced by taking out of the stational time the operations on exclusive tracks. The time engaged in switch-
1545 ing on common tracks is then computed, at six miles per hour and is added to the train mileage which is made at an average of 16 miles an hour. In 1915 the passenger proportion of the revenue train mileage is 53.9%, and of my modified revenue train mile ratio is 48.65%, a difference of 5.3% of the total train miles. By the modifications the passenger proportion of the expenses have been decreased about 5.3% under what they would be by the straight revenue train mile ratio. With regard to the revenue train mile ratio for the division of common expenses I do not know how close to actual results it gets. If we knew actual conditions we would not be using the modified revenue train mile or any other train mile ratio. No-

body knows the margin of error in the ratio used. I make no elimination of the cost of operation over the Mineral Range but we include the cost of operation of our through trains to Calumet in our passenger operations.

We operate a number of through passenger trains that are delivered to us by the Chicago & Northwestern at Negaunee, and the Chicago, Milwaukee & St. Paul at Champion, through to Calumet; we put our crews on them at Negaunee and Champion and operate them through to Calumet. The revenue accruing therefrom comes to the D. S. S. & A; those trains become our trains for the purposes of operation, and as they run through to Calumet over fourteen miles of the Mineral Range Railroad, and are operated over that road by the D. S. S. & A. and D. S. S. & A. crews, we include in our passenger operations the cost of that operation over the Mineral Range road. We bear the cost of the train men, engine men, and the fuel consumed by the locomotives because the D. S. S. & A. receives the revenue from those trains while on its tracks, and in addition a bonus from the Chicago, Milwaukee & St. Paul, and the Chicago & Northwestern of $14,000 a year
1546 for running those trains; for taking the other companies' trains and running them over our track they pay us $14,000 a year in addition to giving us all the revenue from the trains.

The Mineral Range receives the passenger train revenue earned on that line. They charge us nothing for the trackage over their line, but we guarantee that their revenue shall equal forty cents a train mile, if it does not we make it up. As a fact, it does; therefore there is no expense to the D. S. S. & A. for operating this train over the Mineral Range tracks, except whatever cost may be incurred through its employees operating the train and the coal that is consumed. The bonus is credited to our passenger revenue, or it has that effect, part of it; 75 per cent of it is credited to revenue and 25 per cent to maintenance under the Interstate Commerce Commission rulings. The effect is to credit the total amount, $14,000, to our passenger operations.

It is in consideration of our running those trains through to Calumet that the arrangement is made; we have not attempted to show what portion of that cost should be attributed to the Mineral Range. Our operating cost is increased by the expense of our train crews, fuel and supplies used in running the trains. We pay all the train men; the Mineral Range collects its own fares and receives the entire revenue except the rental. The Mineral Range maintains its own line and the only expense we are put to is the operation of the train. We would pay our conductors and trainmen the same wages whether we ran through to Calumet or Houghton; there was no overtime. The engines are ours; the equipment is that of the C. & N. W. and C. M. & St. P., on four of the trains; there are eight trains, four of them are ours. There are four trains up, Nestoria to Calumet each day. There are two big interstate trains from Calumet
1547 through Nestoria, about two hours apart, and return each day. These are made up of sleepers, diners and baggage cars, and are the heaviest trains on our line, running between Calumet and Chicago. The heavy locomotives I spoke of yesterday are in part,

used in drawing those interstate trains. They do both an inter and intra state business. A Marquette sleeper is added to the C. & N. W. train to Chicago at Negaunee. For our own four trains over the Mineral Range we neither get or give a bonus or rent. The Mineral Range operates no trains of its own from Houghton to Calumet. The practice to permit the Mineral Range to receive all the fares is true of our trains as well as those of the C. & N. W. and C. M. & St. P. The plaintiff owns a controlling interest in the stock of the Mineral Range, its books and accounts are kept in plaintiff's office and plaintiff's officers are its officers.

The Mackinaw Transportation Co. property is included in the inventory. The net cost of operating the Mackinaw Trans. Co. is divided between the three operating companies; our proportion of the net loss is charged to freight, because the freight business furnishes none of the revenue. There is a revenue to the M. T. Co. from passenger service. I have given our passenger income no credit for any amount due to net earnings of the M. T. Co. in the passenger business. They charge for carrying passengers across the Straits. Its only income is for passengers, baggage, mail and express and there is no revenue for freight transported on through rates. The passenger earnings are used to reduce the loss or net cost of operation in both passenger and freight by the accountant of the M. T. Co. He reports the proportion of net loss that we are called upon to pay. Plaintiff's interest in the M. T. Co. is a stock ownership. Our trains
run onto the ferry and are carried to Mackinaw City with
1548 passengers in it, and vice versa. The M. T. Co. as a whole
operates without profit. There is no direct charge to the owning companies on account of freight transportation. The net expenses of operation are ascertained by a deduction of revenues from passengers and the small amount of local freight, mail and express and then divided among the three owning companies on the freight over the Straits.

Our passenger cars are run across there for the convenience and benefit of all concerned. We can transfer passengers to the other two roads in our cars; it would be more difficult to transport the cars of the Michigan Central and G. R. & I. over to our line; i. e. a transfer can be made better by transferring cars of the one line to the two, rather than by reversing the situation. We pay nothing for the carriage of our cars across the Straits but they are used for the convenience of the passengers travelling between the three roads making one transfer of passengers do for two. The division of operating expenses is based on freight without taking into consideration the carriage of passenger cars at all, and the passengers are taken into consideration only by way of credit or deduction from the general operating expenses of the ferries. The South Shore pays between 30% and 40% of the expenses of the Mackinaw Trans. Co. I believe prior to 1913 the loss was in part assigned to passenger business.

In separating the mail and express portion of the expenses, my method was to apply 10.78% to the total expense assigned to passenger as representing the cost of that business and as agreed to by stipulation. This percentage was fixed by Mr. Thompson who divided

the accounts for 1912 and this percentage was taken from his results for 1912 and Mr. Parker's for 1913. I made no modification for the heavier equipment which later came into use, the effect of
1549 which was reserved in the stipulation. I make no separation of sleeper and diner business or expenses, except to set off to sleeper and diner business the directly charged costs; that separation is required by the I. C. C. classification. There is a margin of profit in the sleepers, and in the diners a loss; that takes into account no cost of maintenance, wages of trainmen, coal used, track maintenance or things of that character, but simply the costs incident to the operation and management of the sleeping and dining cars themselves. My charges to sleeper and diner business include no part of the haulage cost or anything of that character and no use of property except the cars themselves and the supplies used in them and directly charged to that service.

In the property divisions there was no deduction from property values on account of the portion of the train used in mail and express service. The whole property was assigned to the passenger business. Pltf.'s Exs. 204, p. 15 and 205, (pp. 14-15) show the mileages made in sleepers for 1916 and 1917 respectively. In 1917 the number of intrastate passenger miles was 23,630,061, while the number of intrastate passenger miles in sleepers was 2,147,589, — %. The intrastate passenger miles given do not include those on the Mineral Range and it was not the intention that the sleeper figure should; I think it does not. In 1917 the interstate passenger miles in Michigan were 9,806,277 and in sleepers 3,539,818, approximately 36%. It was not our intention to include the mileage on the Mineral Range in either. It may have been done but I think not. I am not positive. In 1917 the total passenger miles in Michigan was 33,436,338 and the total in sleepers, 5,687,407. Approximately 17%.

The trend of the total intrastate passenger miles in the past few years has been upward and in interstate downward; the per-
1550 centage of intrastate to total being 1914, 64.69%; 1915, 70.29%, 1916, 70.80%, 1917, 70.67%. The greater part of the common passenger expenses for 1917 were divided 70+% to intrastate and the remainder to interstate. What we term sleeper and diner expenses, I mean the directly charged expenses, are not buried in the operating expenses they are set out. There has been set off by me to sleeper and diner no expense for train haulage, coal, time of train men, etc., and if there is such an item chargeable to sleeper and diner it is still included in our passenger expenses, and if there is now divided on the ratio of about 70% intrastate and 30% interstate, notwithstanding the figures given which represent the ratio of use of sleepers and diners by interstate and intrastate passengers—those are the figures of use by those passengers.

1551 DELF.

Cross-examination:

For 1917 about 90% of the plaintiff's passenger expenses were divided between inter and intrastate passenger business on the passenger mile basis; the ratio included all passengers and specifically those travelling on cash fares. Accounts 373, Station Employees and 376 Station Supplies and Expenses, were assigned on the ratio of intrastate passengers to the total number of passengers travelling in Michigan, including those travelling on cash fares. I have made no deduction for those travelling on cash fares made no investigation to find the proportions interstate and intrastate, and can give no approximation. The large number of soldiers carried during 1914 were charged one cent per mile, which reduced the average rate per mile. The valuation expenses for the Federal appraisal appear under general expenses. This expense will be temporary while the records and maps produced will be permanent records. We charge no part of it to capital account. I cannot give you the operating ratio for the Western Division and have made no computations or figures looking towards separating that division. I could not say whether operating expenses there would closely approximate those of the portion of the line outside the State. I eliminated as an item of the general law expense, the expenses incident to this case. This excludes no part of the time or salary of myself, Mr. Caderette or Mr. Eldredge, though Caderette's salary for a part of the period was charged to the case. The practice has been that the time of regular employees spent on this case is not charged to it. The only exceptions are Messrs. Caderette and Tracy. The expenses have not been increased by the wages of the clerical force.

1552 Redirect examination:

Plaintiff has not paid interest upon the $15,000,000 of bonds held by the C. P. R. for many years. It has been unable to do so.

If we took into consideration the mileage of light locomotives it would reduce our 1916 M. R. T. M. ratio about .49% from 44.63% passenger to 44.14% passenger, and our 1917 ratio .5% from 42.21% to 41.63%. For 1913 and previously we had no exact figures of the time of road locomotives in switching operations. We had to obtain those figures by approximation. The requirements of the I. C. C. then required that only the switching over an hour should be taken into account. In 1915 that was changed to require the entire switching time. Since June 30, 1914, our statistics show the time of each locomotive spent in switching at stations. To ascertain the ratio of switching miles in 1914 we took the same proportion of the 1914 train miles that the switching miles in 1916 bore to the train miles. We get no revenue from passengers who occupy the cars or cross the Mackinaw Trans. Co. ferry for that portion of the trip and we pay nothing for carrying the cars across. The Mackinaw Trans. Co. pays nothing for having our cars to accom-odate the passengers. The rate

is the same over the ferry whether the passenger is in our car or not. The use of our cars is simply an accom-odation to the travelling public, saving trouble in getting on and off of the cars and boats. Mail and express revenues are not separated by accounts to inter and intrastate. Those revenues were divided in relation of the passenger revenue inter and intra. So far as operating expenses and revenues are concerned we have eliminated the mail and express. Only the directly assignable expenses of sleepers and diners are eliminated from the passenger expenses.

(Exhibit 210 offered in evidence.)

1553 ARTHUR E. DELF recalled.

Direct examination.

By Mr. Tracy:

I made the computations on the first sheet of Pltf.'s Exs. 201*a*-201*e*, *to* assigned the property between passenger and freight and intra and inter state. In general the method used is the same as that in assigning the 1917 property in Pltf.'s Ex. 201, though the statistics used were those of the particular year. The additions shown in these exhibits less retirements do not agree with the figures shown in our reports of additions and betterments to the State and I. C. C., as those reports are not of values but of investments and the net charge in investment is reported. These sheets show retirements from the valuation of 1913 and additions to the values of 1913 and each succeeding year. In the case of the replacement of a bridge in 1914, the exhibit would take the old bridge out at the Master's value and add the cost of the new bridge. In the reported additions and betterments account the addition would be the cost of the new bridge, but the retirement would be the original cost of the structure taken out if known and if not known, an estimated cost of the old bridge new. We would retire from our accounts exactly the amounts charged in for the structure if it appeated there—the original cost if we had it. Our ledger account shows no depreciation and old buildings stand in our property account at the original cost until demolished or replaced. For the very old structures we would not have original cost and in that event we would have to estimate the amount to retire. The former rule, before the classification of 1915, was that the difference between the new structure in value and the old structure replaced, constituted the charge to additions and betterments. Deft.'s

1554 Exs. 335-336 are blank books furnished the section foremen in which to keep a record of the work done and material used on track of various classes. Ex. 335 was for their labor and to make a distribution of it to the different classes of work; Ex. 336 was to keep track of the material and make a similar distribution. They are required to enter each man's time and make the distribution of it to services daily. The time was also distributed as to the character of work performed, whether putting in rails, ties or bridges, laying in track, or putting in other track; it is entered under the

various primary accounts. In addition he designates whether it is on exclusive freight or on exclusive passenger track. I have examined many of these reports and found them uniformly correct as far as could be ascertained. Ex. 336 is a monthly record showing material on hand on the first of the month, the amount received and applied during the month to the different classes of services and under the various primary accounts.

I do not run across the instance referred to by Mr. Hillman in Section 34, but I found cases where the foreman had entered in the first column provided for freight, passenger and common the amount on exclusive freight tracks, and possibly in Sec. 34, he had entered the balance in the next column which are passenger tracks. It should have been entered in the third column "Common tracks." When those accounts came in for distribution an experienced man checked the labor with the material and he can determine whether an error of that kind is made and correct the error. It is evident those corrections were made as the total amount carried forward to final distribution for all sections for exclusive passenger in "Other track material" of the line is only $450 and the error stated by Hillman was $1528.54, and accrued in "Other track material." Including roadway and maintenance, ties, other track material and track laying and surfacing, the exclusive passenger allocations
1555 were but $793 for the year. I have had careful oversight during the year 1917 of the way these reports were received and distribution made. I believe that except for the two errors of under $1,000 to which I called attention in my direct examination, the reports as corrected carefully show the expenses on exclusive track in 1917. The errors spoken of are where the blue print shows two tracks as common which should have been shown as exclusive freight.

Upon investigation I find that the mileage made by passengers on the Mineral Range are not included in Pltf.'s Exs. 204 and 205, relating to travelling in sleeping cars. In my exhibits I have not included the passenger miles or passenger car miles on the Mineral Range. In instances locomotive miles and car miles have been included for special purposes, e. g. separation of mileage of locomotives or cars to states to get the service in states. I have not included the Mineral Range, aside from the locomotive and car miles for a particular purpose, in my computation beyond including the operating expenses, of our trains over the Mineral Range and locomotive and car repairs.

The account "Superintendence" under "Traffic expenses" I divided between inter and intra, not as overhead to the other expenses of the group as Hillman did, but on the inter and intra state passenger miles. I do not think the overhead basis correct as the item "Outside agencies" is but 7.97% intrastate and the outside agencies which are 92%+ interstate are not controlled by our general passenger agent, but by the general passenger agents of the other companies representing us. Therefore outside agencies should not come into the overhead to determine the distribution between interstate and intrastate. The general passenger agent, superintend,

passenger traffic generally, issues tariffs and tickets and obtains reports of traffic. Under Traffic account, 351, the classification reads:

1556

"This shall include: Pay of officers directly in charge of or engaged in supervising the procurement of traffic, and the preparation and distribution of tariffs, division sheets, and classifications."

The general passenger agent also arranges for local excursions and special trains which are for the greater part intra-state. Pltf.'s Ex. 220 is a statement of plaintiff for Michigan showing its total operations and those of the freight and passenger business, together with the net income derived therefrom before and after deducting the estimated passenger loss and the rate of return of each class of plaintiff's business, based on the valuation of 1917, Pltf.'s Ex. 201 and on the Master's valuation of 1913. The exhibit shows the Master's valuation for each of the four years and the last page shows an average of the four years. This is correctly made up by me. (Pltf.'s Ex. 220 offered in evidence.) Pltf.'s Ex. 221 is a computation of the rate of return on property values shown in Pltf.'s Exs. 201, 201*a*-201*c*, and shows the intrastate value for each year, 1914, 1915, 1916-1917, the net intrastate passenger income and rate of return both before and after deducting the estimated loss. This exhibit is made from figures already in the record, the net returns being taken from plaintiff's Exs. 206, 207, 208 and 209.

Cross-examination.

By Mr. Wykes:

Pltf.'s Exs. 220, and 221, show the entire intrastate property and the return on the passenger property. I cannot combine to give you the return on the total intrastate property. We have made no figures separating freight property or revenue. It is impossible for the court from my figures to ascertain that.

1557

Pltf.'s Ex. 220 relates to each year 1914-1917 and to the Michigan passenger property as a whole. In each instances results were obtained without deduction for expenses on the Mineral Range. In each instance there is no deduction of facilities or expenses by reason of property located in Michigan which serves the entire line, such as shops and water stations. So far as those things should go out of Michigan, if they should go out, the incident expenses are included in the figures entering into my final results.

My results are entirely predicated, so far as common expenses, not divided on some near basis, are concerned, upon the division of common expenses between passenger and freight upon the revenue train miles in Pltf.'s Exs. 206-209. I have made no deduction for sleeper and diner expenses except to carry as a separate item the direct costs incident to their operation. I did not even take out the direct costs.

In Pltf.'s Ex. 221, I show a slight return for 1914 and 1916 and no net return for 1915 and 1917 in intrastate passenger operations, obtained after the deduction of a loss equal to the difference between the rate now being charged and the statutory rate on the business applying to the particular year. That is a straight mathematical

computation applying the two cent rate to the passenger miles. The computation is based on actual travel in each of the years with no allowance whatever for increases in traffic due to stimulation of business. The expenses of plaintiff's trains over the Mineral Range are included in plaintiff's operations with nothing set off to the Mineral Range. Our passenger miles included those of the Mineral Range previous to October, 1912, back to 1910. The item Traffic is one of the group accounts and includes outside agencies, which was allocated by all parties on the basis of an investigation by Mr.
1558 Heiss, on which he separated between inter and intra services. We had made the allocation between services ourselves. The official classification provides that outside agencies shall include:

"This account shall include the pay, and the office, travelling, and other expenses of general, commercial, city, and district agents and other- soliciting traffic, the employees of their offices, and traveling agents and solicitors located on or off the line of the carrier's road. City ticket and freight offices, shall be treated as outside agencies; the pay and expenses of the employees therein and the expenses of such offices shall be charged to this account. Commissions for services pertaining to either freight or passenger business, except commissions paid in lieu of salaries to carrier's agents located upon the carrier's own line shall be included in this account."

The supervision of operations under the account "Outside agencies" is directed by the general passenger agent. We have no superintendent of traffic. The expense- of the general passenger agent are in part found under the item 351, Superintendence. A portion of the item, "Outside Operations," comes in through commissions paid to agents of other lines who have sold tickets over our line. On those agencies the entire supervision was given by the officer of some other company. If the G. R. & I. agent routed passengers over our line and we paid him for it, he was superintended in that operation by G. R. & I. officials. If one of our agents routed passengers over the G. R. & I. there might be a reciprocal arrangement by which our agent would get a percentage on the ticket by personal arrangement with the G. R. & I.

"Q. If the G. R. & I. is extending supervision to that service that they know nothing about, it is done without the consent of the
1559 general officers, is it not?

A. That I don't know; I don't know what the arrangement is; I have nothing to do with that."

We get varied rates on excursions on our line there being no fixed rates. There may be a general tariff filed with the I. C. C. or State Commission for week end excursions. The rates for that run considerably below our usual rate. That covers round trip transportation. I have not those rates in mind, I could not tell them. I have never made any computation to find out how many passengers per year we get on that sort of business. I have never made any computation to see whether it is profitable or not. We run those excursions every week end. In addition there are many special excursions between points on our line and to Detroit and other connections. There is a considerable volume of the excursion

business. I do not know whether we would get the business or not if we did not make the special rate. It is made to stimulate the business in cases where there are special fairs like the county fair at Marquette, to get people to go to the County fair. We make special rates in combination with other railroads that go as far as Detroit. We go to Detroit twice a year. I do not think we make any special excursion rates beyond Cleveland. I know of none to eastern points except possibly once a year at St. Anne de Beau Pre, north of Quebec. That business is carried on to get the business in volume. In many instances the special rates given do stimulate business and we necessarily get more business on account of it. When there is a special occasion that the people want to go to and we run a special train and give a lower rate, it is an inducement and brings the people. A low rate is an inducement to the people to take a journey which they would not otherwise take in bulk.

1560 The million miles of state troops carried in 1914 at 1¢ per mile fixed by statute entered into the accounts in the amount received. The effect is to make the estimated loss as we have figured it, too low. There would be another cent a mile on that travel. Defts.' Exs. 335-336 were used by me to find and attribute $56,123 to the expense of maintenance of exclusive freight tracks in 1917 and $1,045 to exclusive passenger and a certain amount to common maintenance. I have not that amount. The results are taken from all sources, whether they come through section books or from other sources. The amounts reported in Defts.' Exs. 335-336 would not aggregate the amounts spent in maintenance of track separated to the various services. There is a way of checking the books for the particular items we have referred to.

"Q. In the book entitled "Distribution of Track Labor," I am unable to find anything in it which relates to any division between freight, passenger, and common, or "neither," which is the head of the fourth column, which relates to any distribution between services.

A. Just what do you mean by "Services," the primary accounts.

Q. Between freight, passenger, common and neither, between those services, for the purpose of that question. Those columns you tell the man not to fill out, but you tell him *him* at the bottom of the sheet in the middle of a book of perhaps ten pages "In front of the time entered daily for work done on exclusive freight or passenger tracks, write the letter 'F' for freight, or 'P' for passenger." That is the sum total of the directions contained in that book, is it not, Mr. Delf?

A. The instructions are in the front.

1561 Q. Find in the instructions then where you direct him in any detail to divide between services. I have not been able to find it.

A. "Distribution of labor (Pages 2 and 3) Enter hours worked on each kind of work under proper heading. The total number of hours for day for all employees will be same as total shown on time roll."

That is the second paragraph on the first page, on the cover. Distribution of labor, pages 2 and 3.

Q. Well, now, that relates, does it not, to the kind of work which is set down on the side of the sheet, and not to your columns of distribution at all.

A. As a matter of fact it relates to the whole thing.

Q. It relates to anything that the men might be bright enough to find in that book, doesn't it?

A. And they do; they designate freight or passenger as is intended by those instructions.

Q. And the check that you say was made of this was a check made to discover errors apparent on the face of it?

A. Yes, to check the labor and material.

Q. If a man had been guilty of a mistake in judgment, or had not understood the instructions, and had put his figures in the wrong column here on the right of the page, you had nothing in your office that would permit you to correct that error, had you?

A. Yes, the fact that distribution of labor showed that there was no labor in the passenger item, and there was material under the passenger, would indicate that there had been an error in the distribution of that material.

1562 Q. When a man requisitions his material, he requisitions it for the passenger service, freight of common?

A. He requisitions it for general service.

Q. If he requisitioned it for general service and it were assigned out to general service, what record have you in your office to permit you to determine whether he had correctly entered it under these items into which general service would be divided?

A. There are only three services, freight, passenger and common.

Q. And "neither," whatever that is.

A. If he didn't use it for either service it would be still on hand, as shown in the red book.

Q. What I want to know is, when it was assigned to general service, how could you check to see whether he was correct in reporting its use for a particular service?

A. If you will refer to the distribution book, and the instructions in the distribution book, they are clear as to how the is to report the material as to the freight, passenger or common service in the use of material.

Q. In other words, you say they are clear because it says that: "Particular care should be taken to enter in the proper columns material used on exclusive freight, exclusive passenger, or common tracks."

A. Yes.

Q. But you furnished the men nothing else for the purpose of telling him what is a freight, or what is a passenger, or what is a common track, but you did furnish him with this blue print book that has gone in as an exhibit, that I insisted was misleading?

1563 A. We furnish him the blue print book, and if you will refer to the white book, at the bottom of page 4, where he makes the distribution of time, you will see in bold type: "In front of the time entered daily for work done on exclusive freight or passenger tracks, write the letter 'F' for Freight, or 'P' for passenger.

If you will refer to the white book, Mr. Wykes, you will find——

Q. You mean that notation at the bottom?

A. Yes.

Q. I read that, I called your attention to it a few minutes ago, that F and P?

A. Yes.

Q. In other words, instructing your man not to put these in appropriate columns after you told him to in the other book, but to put the words "and P before it?

A. That is so that this further distribution can be made in the general office.

Q. You say you made a check in the office of these books, do you know how many errors they discovered?

A. No, I do not.

Q. The checking made in your office or in the engineer's office?

A. It is in the engineer's office under our supervision.

Q. And if that 34 was found and corrected as you think it was, it was not called to your attention?

A. No, it was not. It must have been corrected as it was not carried into the final distribution.

Q. Or, Mr. Delf, there must have been an offsetting error
1564–5 somewhere else that in effect corrected it?

A. I don't see how there could be an offsetting error to correct an excessive assignment to the exclusive passenger. It would necessitate a credit to do that."

The retirements and additions in Pltf.'s Exs. 201*a*, *b* and *c*, are based partly on cost but do not follow the costs or our books or reports completely. In retirements we have cut out the Master's value at his unit price, thus excluding the item that he included. The charges in our books under "Road" or "Additions and Betterments" are charges to investment and not to value, would represent the charge in our property accounts and would not be the figures in these exhibits. In the retirement of an old bridge, the charge to operating expenses would be the same as the credit to the old structure, which is either the ledger value or the estimated value less salvage.

Redirect examination.

If there is depreciation reserve in our books a portion of the retirement would be charged to that account and the balance to operating expenses. We carry no depreciation reserve except on equipment and ore docks.

1566 R. C. YOUNG, recalled before the Court Nov. —, 1917, by plaintiff.

Direct examination.

By Mr. Tracy:

I have examined Riggs' and Hansel's appraisals and the Master's report, and find no price fixed as of 1913 except Schedule 6, Ties,

the prices used being those of 1911 and 1912. The proper comparison to show effect of increased prices is between the prices of 1911-1912 and those of 1917. Mr. Caderette conferred with me regarding unit prices. I am familiar with those he used. The price for earth grading is low—lower than you would expect it to be done for in 1917. I did considerable construction work in 1917 but let no grading contracts; on one proposition, two miles of grading, I obtained figures from three contractors but they were so high I advised against acceptance. They were higher than the prices here used. Prices have increased more than the differences between the previous appraisal and the 1917 prices. Labor is a principal element of grading and the increase in labor 1911-1912 to 1917 has been approximately 50%; decreased efficiency makes the increases much more; we are not able to get as efficient men as in 1912. The prices used for rock and for clearing and grubbing are all low, in my judgment. In the 40¢ for grading, I figured shrinkage to be added to the yardage and that, where the work is not steam shovel, overhaul should be added. I do not think the 7.5% added by Riggs for overhaul, etc. ought to be included. I added 10% for shrinkage, drainage, road crossings, etc. The tie prices are too low to cover an average of 1917; they are made possible because of many settlers along the road where ties can be purchased in small quantities. Mr. Caderette's figures included no charge for handling. Tie prices went up rapidly after November 1916. 9¢ would be proper to take the ties from along the right of way to the material yard or deliver them to the track laying gang. That figure based upon
1567 cost would be: loading 4.5¢, hauling 3.78¢, loading 1¢, total 9.28¢. The prices we paid for rail in 1917 were rather more than those used by Caderette. Upon whether the increases in rail price is temporary or permanent, we have decided not to postpone our work to await lower prices. I think they won't be any lower for several years. Rail prices have been uniform for the last 15 years; other steel products have fluctuated but gradually raised. Under track fastenings, our angle bars have not cost quite as much as the figure he used. Track laying includes taking the material from the yards, laying it on the finished grade and spiking and lining it up. Surfacing is the taking of the material from the shoulders and sides of the track and putting it into shape so the track can be used without danger to trains and material until the ballasting begins. I do not think the track laying and surfacing could be done in 1917 for $900 a mile. It always cost me about $764 a mile and the increase in labor and train service is 50%, under present conditions. This is largely a labor item except the train service. We do not hope for any lower labor prices for some years. I think next year will be worse than last. Track laying machinery does not decrease the cost but makes it a little quicker. The 1917 unit price for ballast is made up of: Gravel in pit, 2¢; loading, 12.59¢; stripping pit, 2.25¢; pit tracks, 2.25¢; transportation, 20.5¢; cutting out between ties, 3¢; raising and tamping, 23.74¢; fixed charges on equipment, 6.45¢; total, 72 78¢ plus contractor's profit of 10%, equals 80.06¢. I think this price fair and conservative. I think the sand

ballast price too low. The only reason why cinders should be lower than gravel is because of the cheaper loading. I think Caderette's price fair for side tracks but not enough for mining tracks
1568 included in his side tracks schedule. I know the character of construction and of the rails, ties and side tracks of the plaintiff. The cost of labor and material has increased since 1912 and 1913 very materially.

Cross-examination.

By Mr. Groesbeck:

The price of rail, 1900-1916, was $28 a ton; in 1917 it was quoted at $38 for Bessemer and $40 for open hearth. The price advanced very rapidly on all classes of material in 1917, I presume due to the enormous demands for shell steel and export demand. I think the steel and other track material prices will remain where they are for sometime. We built no bridges and bought no bridge material since the winter of 1915-1916. Most roads obtain a price from a bridge company to build the bridge complete, though some do their own erecting. The shop plans are furnished by the bridge company but the original plans are furnished by the railroad. They are not standard specifications; every bridge is a proposition by itself—designed by itself.

When you make a cut with a steam shovel, all but large stumps are grubbed out with the shovel. On this line, St. Ignace to Marquette, there would be no steam shovel work; there is nothing east of Marquette sufficiently heavy to pay to transport a steam shovel over land to get it there. Where the embankments are over 2.5 feet high no grubbing would be necessary, but where under that, grubbing would be paid for. At present it would cost more to get the grubbing done than the price I approved. Out of 52.8, 100 foot stations in a mile, 40 would have to be grubbed. The price during 1917 would be $18, and in 1912 about $12 a station. The figures I approved are all based on the theory of reproduction new and on what I think 1917 costs would be.

1569 EDWARD S. BICE, a witness for plaintiff, produced before the Court on Nov. —, 1917.

Direct examination.

By Mr. Eldredge:

I am vice president of the First National Bank of Marquette having been connected with it 26 years in various capacities. The president resides in New York and I am in practical charge. I know the interest rate prevalent in the Upper Peninsula and along plaintiff's line, by having discounted paper and by making collections for other banks. We have loaned money at most of the principal places along the line. The rate of interest prevalent on secured loans is 7% in small transactions, and 6% in the larger. The 6% rate pre-

dominates. Of our local loans, 15% would be at 7% and 85% at 6%. This rate has prevailed ever since I have been connected with the bank.

Cross-examination.

By Mr. Carr:

On savings deposits we pay 3%, which is the customary rate with banks of the Upper Peninsula. That money is subject to taxation to its owner. The Marquette bond interest rate is 4% and 4.5%. There are no recent issues. The interest on local loans has remained stationary. Outside loans that we purchase in banking centers it has increased during the last 1.5 years due to the extraordinary conditions in the money market. Money rates for 2 or 3 years prior to the middle of 1915 were at a low ebb. Railroad obligations I have been familiar with, are from 4% to 6%, depending on the issue. The average rate of interest on railroad bonds in 1895 was approximately 4.69%. Prior to the commencement of the war, interest on railroad bonds had decreased to less than 4%.

Redirect examination:

1570 The rate of interest on a railroad bond depends upon the view of the public with regard to that particular railroad. I had in mind the rate of interest that the bonds bore. The rate of return would be higher—considerably so, at present.

Recross-examination:

4% bonds of the Pennsylvania & New York Central sold above par in years gone by. I think 4% bonds of the New York Central are along 94 or 95. I have not seen a recent quotation. These bonds are subject to taxation in the hands of the owner. In this State bonds of 2 or 3 years ago bore 4% interest. The first government loan was floated at 3.5%, the second at 4%. I am familiar with the Michigan law permitting the payment of a small specific tax on a Michigan bond or mortgage in lieu of other taxes. The prevalent rate of interest on mortgage securities along the line of the South Shore in Michigan is 6%.

1571 CHARLES F. LOWETH, plaintiff's witness recalled before the Court Nov. 26, 1917.

Direct examination.

By Mr. Tracy:

Qualifications given on previous appearance.

I testified previously in this case. Mr. Caderette conferred with me this summer to obtain unit prices to apply to 1917 values; I have since examined his unit prices in detail; I advised him at the time that I thought the prices were conservatively low; my subse-

quent examination has confirmed that. Since previously testifying I have verified the unit prices I then gave to be applied to items under grading. This by the experience of 5 years since the previous trial of this case and by price agreed upon between the C. & N. W. and the C. M. & St. P. for the transfer to the latter of a joint interest in a large number of mining spurs in the Upper Peninsula in the Crystal Falls and Iron River Districts. Agreements for that purchase were made early in 1915 and appraisals were made shortly before. The property was gone over by the engineering departments of both companies and the quantities ascertained. Prices fair and reasonable in the judgment of the engineering departments of both companies, were then applied. The prices for earth work were 30¢ and 33¢. The tracks represented different kinds of construction, were long and short and the work was both light and heavy. The unit prices on moving rock and clearing and grubbing were relatively the same to the prices applied by the Master, as the price for earth work and to which I previously testified. They were all higher. Values and unit prices were practically the same in 1913, 1914 and 1915. I believe the prices paid the C. & N. W. were fair to our Company as a purchaser. The grading prices in 1917 would be materially increased due to increased cost of labor, and other elements. The increase for earth work to 40¢ a yard for 1917
1572 would be fully justified as would the increase for rock, and clearing and grubbing. After study of the reason for increased labor costs and the probability of their being permanent: extending over many years there has been a decided and gradual increase in labor costs and very few instances of a general reduction; so far as organized labor goes, I think there has been a constantly ascending rate; unskilled labor is becoming more and more organized, so I think the same rule will apply to it; I think the tendency will be materially increased in future because of legislative recognition of the protection of labor; I think those tendencies are independent of abnormal conditions due to the war, that the war will aggravate the other tendencies and make less probable a reduction of present labor rates. The emmigrants will not come over in the future as in the past, as there will be more work and higher rates at home and less inducement to come to this country. I do not expect labor as entering into a railroad or its materials, to be materially lowered in the near future. We are not deferring any work on the score of high cost of labor, hoping it will be reduced. A recent investigation I made to determine fair average increases in the cost of structural steel for bridges in 1916 as compared with 1914, shows an increase of 69%. That was a fair average for the calendar year 1916. The difference to 1917 would be materially greater; Mr. Caderette's price of 7¢ per pound for steel in bridges in place, in 1917 as compared with 4¢ per pound adopted by the Master as of 1912 or 1913 is too low. The increase of $6 per thousand for timber in place in bridges in 1917 is less than should properly have been made. I base this on the increased cost of labor and lumber in 1917 over 1912. Increasing cost of piling in 1917 to 50¢ over the Master's 40¢ is very conservative. I have been over

plaintiff's road a number of times; made a special trip over it last June. I found it in very good condition and found the few
1573 bridges I examined in a very good condition of repair, also the rails, ties and ballast. They were in excellent repair for a railroad of that class. The unit price of $41.25 per ton for rail delivered along the bank ready to be placed in track, is too low, as not enough is added for handling. After study of the question I do not think there will ever be a return to the prices for steel that prevailed prior to the war. There may be lower prices than now prevail for some steel products, as some are very high. I doubt if there will be a recession in price for many years, if ever. I doubt if there will ever be any reduction in the cost of steel rails. Steel rails have been fixed arbitrarily for 16 years past and before the war there was much demand by steel manufacturers for an increase. It was brought about by the increased cost of steel products generally and by the railroad's demand for better quality of rail. The tendency of this demand for better rail was to increase the cost materially. For this reason I believe there will be no reduction in the cost of steel rails. I think the average cost to our road of track fastenings for 1917 slightly in excess of Mr. Caderette's price. Mr. Caderette's 1917 prices for ballast are reasonable and conservative. I do not think track laying and surfacing could be done for $900 a mile. I think $1200 a conservative estimate. We have used track laying machines on all classes of work, and my price would be based upon the cost so done. In reconstructing the plaintiff's railroad it would be impractical to lay the track by hand as it would be cheaper and take less time by machine. There is very little grading on this railroad which it would be economical to do by steam shovel, and there is much of it where a steam shovel could not be used at all. A steam shovel is heavy and cumbersome, cannot easily be hauled over country roads and does not pay unless the work is of
1574 such volume as to justify the cost of installing it. It is commercially impractical to construct your grade as you go along, moving the steam shovel on the track. That process would be very slow. It would be difficult to get steam shovels onto the South Shore and much of the work is of a character that it could not be done with steam shovel.

Cross-examination.

By Mr. Groesbeck:

Under certain circumstances it would be economical to transport a steam shovel over country roads. The work is sometimes done by first making a narrow cut to lay the tracks through a particular section, after which the steam shovels are brought in to move the earth and widen the cut, but that is not the customary way, nor is it practical railroading. If you had a location, such as that around Wetmore or Munising Junction, where there was five miles with 60,000 yards of earth work per mile, it might be more economical to put in a steam shovel and when you got through take it to another place of like character and repeat the operation if the other places were

such that a steam shovel could be economically and profitably employed.

This is providing the work where the shovel was first engaged could be finished in advance of the other work. A steam shovel will move a large amount of earth more quickly and cheaply than other methods. In my figures I have proceeded upon the cost of production new theory, assuming that the plaintiff's railroad would be entirely wiped out and the condition as it would be if the railroad was removed at this time. This would leave the country in natural condition with no grading or roadbed. I take away the South Shore leaving other railroads and highways as they are. I do not take into consideration the original cost, nor do I know it.

1575 It is doubtless true that the steel mills and manufacturers of locomotives have been increasing their capacity and output in the past two or three years, this being due to the use of the output as instruments of war. This is increasing and when the war ends it will be found that steel plants and like industries have increased their capacity to a very large extent. In my judgment when the demand for war materials ceases, the demand for other classes of materials will increase. I understand that the capacity to manufacture steel products and the efficiency of the plants, both in this country and in Europe, has been very largely increased. Laying track by machine is a common practice, and that is the proper way when there is any quantity of work. Such a machine costs about $3,000; properly mounted and supplied, under average conditions it will lay a mile or more of track a day; occasional records show two miles a day. In building a railroad the first thing is to make a survey, then acquire the right of way, then clear, build the sub-grade, ditch and put in bridges and culverts, build telegraph and telephone lines, then lay the ties, tracks and ballast.

Prices were about the same in 1911, 1912 and 1913, a little cheaper in 1914 and about the same in 1915; in the spring of 1916 there was a raise of 10 to 20%. Compared with the first time I went over plaintiff's railroad, its present condition has changed for the better. It has better ballast, its right of way and tracks are in better shape, and it is evident that the property has been very well maintained at least.

There is no doubt that the tonnage being moved in a train is today greater than a few years ago. The tracks purchased from the C. M. & St. P. by the C. & N. W., was a half interest in mining spurs

1576 already built and operated. We did not get quite the same rights as the C. &. N. W. as they reserved the right of operating over them in certain cases and doing our switching. We acquired very nearly the equivalent of a joint ownership. It was the equivalent for all practical purposes and in that deal we used the prices I have stated. When I stated steel bridges went up 69% in 1916, I referred to the entire calendar year.

Redirect examination.

By Mr. Tracy:

If the engineering on roadway and structures on this line could have been done in 1913 for $255,000, I think that a conservatively increased cost in 1917 would be 20%. I have in mind the cost of engineer's services and I perhaps under-estimated the small amount of common labor. It would be 25% or more as against Mr. Caderette's 30%. The work of a preliminary survey for construction of a line following the plaintiff's present line could not be done satisfactory to me for $100 a mile, and I do not see how it could contract for such work, as that requires skill, time and judgment.

My estimate of the cost of track laying and surfacing was derived from experience, both before I testified previously, and in work done since and in assembling information as to the cost on various railroads for the Federal appraisal. I know of no case where any railroad has reported track laying and surfacing as low as $900. Mr. Prouty conceded the cost for the Texas Midland, a light, poorly constructed road, should be $900 as a minimum. A steam shovel coul l be used on the plaintiff's railroad but generally would not.

1577 *Evidence on the Part of the Defense in Open Court.*

C. A. PARKER, recalled before the Court as a witness for Defendant, on Nov. 26, 1917.

Direct examination.

By Mr. Wykes:

(Qualifications set out in previous testimony.)

I previously testified in this case. The evidence of the various witnesses as to land values has been compiled by me in Defts.' Ex. 301, which places the testimony and a reference to the record page opposite each section of land. The exhibit is self explanatory.

I believe I have brought together all the testimony relating to country land values.

In Defts.' Ex. 302, is a computation of testimony regarding the value of plaintiff's land located to counties, showing the area, the witness whose testimony is accepted for the purpose of this computation, the record page, the price per unit of value whether by square foot, acre or otherwise. It is noted as to whether it is in railroad or non-railroad use, and those computations are extended to classify it as to freight and passenger, common freight and passenger, ore lands and the total value. This exhibit is in same form as plaintiff's exhibit before the Master and contains the same areas though somewhat differently divided. I have attempted to account for all lands and have applied the prices taken from the record, of the witness relied on by defendants. The property is then separated to services on the same basis as plaintiff used. This exhibit was before the Master but

has never been proven in any testimony. The final totals on Defts.' Ex. 302 represent defendants' claims. Defts.' Ex. 303 is a list of the assessed values of plaintiff's railroad 1902-1916 inclusive. The final assessed values being for 1914 and 1915, $10,500,000,
1578 and 1916, $11,000,000. (The reports of the plaintiff to the State Board of Assessors for 1914 to 1917 inclusive, were marked defendants' Exhibits, 1914 equals Ex. 304, 1915 equals Ex. 305, and 1916 equals Ex. 306. It is agreed between counsel that all the original reports of the plaintiff to the State Board of Assessors or Railroad Commission may be considered in evidence.)

Defts.' Exs. 304, 305, and 306, reports for 1914, 1915 and 1916, contain the following description regarding its real estate:

"Detailed statement of the real estate owned by the Company in Michigan on the 30th day of June, 1914, where situate and the value thereof. Then follows, description and location and the column provided for value. That portion of the Duluth, South Shore and Atlantic Railway situated in the State of Michigan as shown on page 13 of this report. The value of the following item- being taken together to make up the total value. Engineering, right of way and station grounds, real estate, grading, bridges, trestles and culverts, ties, rails, track fastenings, frogs, and switches, ballast, track laying and surfacing, fencing, crossings, cattle guards and signs, interlocking and signal apparatus, telegraph, station buildings and fixtures, shops, round houses and turn tables, water and fuel stations, warehouses, docks and wharves and miscellaneous structures, $8,244,-946.00. That is opposite the printed note Total in Michigan."

On page 11 of exhibit 304, being for the year ending June 30th, 1914, the page is headed "Personal Property" and requires an answer to the following:

"Detailed statement of all personal property, including moneys and credits owned in the state of Michigan on the 30th day of
1579 June, 1914."

Then follows columns headed, Description and Value. Then this is answered:

"Personal property of the Duluth, South Shore and Atlantic Railway Company situated in the State of Michigan as follows: Cash, stores and supplies, shop, machinery and tools, balance of accounts, ferries and a proportion of the total value of locomotives, passenger, freight and miscellaneous equipment, $2,900,000.00."

Approximately the same value appears in the reports of 1915 and 1916.

The report for 1914 contained the following affidavit:

"STATE OF MICHIGAN,
County of Marquette, ss:

I, the undersigned, A. B. Eldredge, president of the Duluth, South Shore and Atlantic Railway Company, on oath, do say that the foregoing return, except so far as the same attempts to give valuation of property, has been prepared under my direction from the original

books, papers and records of the company; that I have carefully examined the same and declare the same to be a complete and correct statement of the business and affairs of said company in respect to each and every matter and thing therein set forth, except the valuation of property, to the best of my information and belief; and I further say that no deductions were made, before stating the gross earnings or receipts herein set forth, except those shown in the foregoing accounts; and that the accounts and figures contained in the foregoing return embrace all the financial operations of said Company during the period for which said return is made.

I do further state that this Company is now engaged in litigation with the State of Michigan or its officers, in respect to the
1580 validity of the so-called Two Cent Passenger Fare Law, and therein the value of its property for rate making purposes, as well as the question of what property is used in railway operation, is in issue; that in said litigation the Attorney General and Railroad Commissioners allege and contend that the value of the company's property used for railroad purposes in Michigan does not exceed the sum of $11,000,000.00.

With reference to the property in the said report described on page 9 thereof, I have no knowledge or information, or present means of acquiring information, so that I can state the value of the same, or of the separate parts thereof, except I should base my judgment on the conflicting statements of witnesses who have sworn in the litigation above referred to, and therefore I directed that a valuation be given to the said property which, taken with the property described on page 11, would approximate the valuation given by me in the verification of the bill of complaint in the litigation above referred to.

With reference to the property described on page 11, I have no personal knowledge of its value, but I believe, from the information given me by the employees of the Company, that, as a part of a going railway earning a fair return on its investment, it is worth the sum named.

In valuing the real estate described on page 10, I directed that the assessed valuation thereof be used, except in one or two instances where I had reason to believe that the assessing officers had made their valuation in error by confusing one piece of property with another. In most instances under this heading I directed that there should be included the lands which in the past have been locally assessed, although I think it more than likely that the decision
1581 on the litigation above referred to may determine some of these lands to be in railway use, as also it may determine lands not to be in railway use, *as also it may determine lands not to be in railway use,* which have been so included in the value given.

It was my intention to arrive at a total value of the property operated by the company which should approximate the figures given by me in the verification of the bill of complaint above referred to.

It is my judgment that the value of the property of this company fixed by the State Board of Assessors for the fiscal years ending June 30th, 1912, viz. $9,600,000.00 is for the purposes of taxation, a fair valuation, when the value fixed upon the other property of the state

for like purposes is considered, and when the return received by this company on its business is considered.

(Signed) A. B. ELDREDGE,
President.

Subscribed and sworn to before me, this 17th day of September, 1914.

W. J. ELLISON,
Notary Public, Marquette County, Michigan.

My commission expires Jany. 6, 1916."

Defts.' Exs. 304, 305 and 306, contain statements of current additions and betterments. They are shown in net amounts to be:

1914	$104,309.12	
1915	55,516.20	reduction
1916	114,654.90	"
Total	$65,861.98	net reduction.

The report of the company, Defts.' Ex. 306, states additions and betterments July 1, 1907, to June 30, 1917, as a net increase
1582 of $1,376,256.82.

The plaintiff's reports to the State Board of Assessors for 1912 contained the following affidavit:

"STATE OF MICHIGAN,
County of Marquette, ss:

I, the undersigned, A. B. Eldredge, President of the Duluth, South Shore & Atlantic Railway Company, on oath do say that the foregoing return has been prepared under my direction from the original books, papers and records of said company; that I have carefully examined the same and declare the same to be a complete and correct statement of the business and affairs of said Company in respect to each and every matter and thing therein set forth to the best of my knowledge, information and belief; and I further say that no deductions were made before stating the gross earnings receipe herein set forth, except those shown in the foregoing accounts; and that the accounts and figures contained in the foregoing return embrace all of the financial operations of said company during the period for which said return is made."

That is the end of the printed form, and following that in writing appears the following:

"I further state that the valuation of property, except as otherwise appearing, are my estimates of the value based upon earning capacity of the property, and that I have no other means of personally making a valuation, and further state that I do not know the value of the

lands listed as not used in operation and I believe that some of the lands so listed are in fact used for railway purposes; that this is a matter not easy to determine and is now involved as a legal question in a suit between the Railway Company and the State.

(Signed) A. B. ELDREDGE,
President.

1583 Subscribed and sworn to before me at Marquette, Michigan, this 14th day of September, 1912.

W. J. ELLISON,
Notary Public.

My commission expires January 6, 1916."

The valuation claimed that year by the Company was: Real estate $9,117,946; Personal, $2,027,000. The report for 1913 contained an affidavit similar to that of 1912. The amount reported for taxation for 1915 was: Real estate $8,244,946; Personal $2,900,000.

Defendants' Ex. 307 (introduced in evidence) is a statement of the investment in road and equipment for Michigan, being a statement of additions and betterments by years, the first three years, 1914, 1915 and 1916, being compiled direct from the annual reports of the Railroad Company to the State Board of Assessors for those years. The fourth column of figures headed "Parker" is an assignment for the year ending June 30, 1917, which is made by me on the bases which were used in the previous years, that is, the comparable bases, namely, road miles, and that data was furnished me by Mr. Delf.

This exhibit was correctly prepared by myself. I acquired information as to additions and betterments for the entire line and assigned engineering, shop machinery, equipment, etc., to Michigan on bases used in previous years by the Company. The fifth column shows the totals for the four years. The red figure indicates a net deduction, indicating some retirement of property. Defendants' Ex. 308 shows statistics of plaintiff's passenger, ore, and freight traffic.

They are passenger and freight and separately the ore freight statistics of the D. S. S. & A. such as were available to me from 1902 down to the end of the fiscal year 1917. They show the passenger train miles and car miles, average number of cars per train mile, passengers per car mile and per train mile, all passenger
1584 miles or the number of miles travelled by passengers, and that is subdivided into inter state and intra state by figures taken from records in this case. And under the freight statistics, shows the freight train miles, the freight car miles, average number of cars per train mile, the ton miles of freight, average ton miles per train mile, average tons per car mile, and then a subdivision of that, of the freight statistics indicating the ore business separately. These figures were compiled from the plaintiff's records except the inter and intrastate passengers one mile, which was taken from the records in this case. The statistics regarding the ore business were furnished to me by the Company. The average tons per train mile is shown to be: 1911, 241.27 tons and 1917, 348.06 tons. These are correctly

compiled by me from reports of the Company. (Exhibit 308 introduced in evidence.)

Defendants' Ex. 309 is based on the train consists of various trains over plaintiff's road, and shows: first column, weight of locomotives; second column, weight of baggage, mail and express cars; third column, weight of coaches; fourth column, of diners; fifth column, of sleepers, last column, total weight of train. Train 3 and 4 is a heavy train, C. & N. W. Copper Country Express to and from Chicago. My computations show that the foreign sleepers on trains 3 and 4 and C. M. & St. P. trains 103 and 104, Chicago to Copper Country, and back, and the sleepers separated from those trains and run into Marquette, for 1916, carry an average of 4.87 passenger miles per car mile. That is, all inter and intra passengers on the sleepers were less than five passengers per sleeper. These are the interstate trains to and from Chicago. The sleeper on the Soo route, Detroit to the Soo and return, 1916, 9.62 passengers and in 1917, 10.87. Of the 639,967 passenger miles in the Soo route, sleepers for 1916, 564,155 or 88.15% were intrastate, that is 8.48
1585 passengers per car out of a total of 9.62 were intrastate.

Out of 686,509, passenger miles on that route in 1917, 608,526 or 88.64% were intrastate, being 9.64 intrastate passengers out of a total of 10.87.

The same analysis for the foreign or interstate sleepers to and from the Copper Country and the Marquette on C. & N. W. trains 3 and 4 and C. M. & St. P. 103 and 104 and D. S. S. & A. trains 10 and 11 Negaunee to Marquette and C. & N. W. train 110 with Chicago sleepers the trains being essentially interstate, shows that out of a total for 1916 of 733,267 miles, 118,509 or 16.16% were intrastate. This was .79 of one passenger intrastate of a total of 4.87 passengers per car mile.

Over the same route out of a total for 1917, of 759,691 passengers, 106,763 passengers miles or 14.05% were intrastate, this being .71 passengers per car mile out of a total of 5.04.

Trains 3 and 4 and 103 and 104 which are the interstate trains to the Copper Country require pusher service up the L'Anse hill on the return trip going south and east, and No. 7, is pushed up the hill out of Marquette going west. The statistics shown on Defts.' Ex. 309 were correctly compiled by myself. Defts.' Ex. 310 prepared and correctly compiled by me, divides passengers carried in foreign sleepers between interstate and intrastate. The figures are comparable with Mr. Delf's, though his exclude the passenger miles made on the Mineral Range, while I did not. Defendants' Ex. 311 is the detail to show the number of passengers carried on the several routes and the passenger miles made in Michigan both total and intrastate and the percentage of intrastate for 1916-1917. For comparison I have in-
serted Delf's figures below the line in each instance. My
1586 statistics regarding travel in sleepers were taken from the conductors' cards and the consistent difference from Delf's figures from month to month indicates that he has included the haulage in sleepers on the Mineral Range. The computations are correctly made and figures correctly set down on Defts.' Ex. 311.

Defts.' Ex. 312, shows the passengers in D. S. S. & A. sleepers as distinguished from those in foreign sleepers. This is based on Mr. Delf's figures with a deduction, based on investigation and records, on account of the Mineral Range and the figure below the line in each instance is our figure for the total passenger miles in sleepers and the intrastate. These computations were correctly made. The latter sould be 1917, not 1916.

Defendants' Ex. 313 is a comparison of the passenger miles in sleepers with the passenger miles on plaintiff's railroad. The upper half shows the total passenger miles for 1916, being the same as Delf's, and the percentage relation of intrastate and interstate to the total; below, separately totaled, are the passenger miles in sleepers, the Soo route being 88.15% intrastate and 11.85% interstate. Out of the total passenger miles 29,683,083, the number in sleepers was 6,049,936, or 20.38%, there being 8.81% of the intrastate passengers and 48.44% of the interstate passenger miles which were made in sleepers. The percentages for 1917 are shown at the bottom and the figures on the exhibit were correctly compiled. (Ex. 313 introduced in evidence.)

Defts.' Ex. 314 shows the average weights per revenue train mile of plaintiff's train for the fiscal years 1912-1917. Each class of traffic is subdivided to show weight of locomotives, and cars by classes and the traffic. Using 1912 as an example: the first column is
1587 aggregate ton miles passenger, and the different headings distribute those tons between the different elements of the passenger service. The first column under freight is the total ton miles for the year, and the ton miles of each part of the train and the average are shown. The ten ton factor used for passenger loading is an estimate and is divided between mail and express and passenger and baggage. The locomotive weight takes for its basis the weight of the locomotive and tender in working order plus 60% of fuel and water capacity. The mail and express and baggage are arrived at on the space basis. The figures were taken or based upon weights as determined from Company records. They are all based on individual weight units in both passenger and freight services and are correctly taken and applied by me. Defendants' Ex. 315, shows the average weight of plaintiff's passenger equipment per car mile for 1912, 1913, 1914, and 1917 divided into the three groups, sleepers and diners, mail and express, passenger and baggage. The average is stated in tons. This shows an increase in the weight of sleeper and diner equipment in 1917 over previous years; over 1912 of approximately 10 tons per car. I assumed 1915 and 1916 would show approximately the same results as for 1914 and 1917. The weight of mail and express equipment increased 1912-1917 about 13%+.

Upon investigation I find that of the total passenger train car ton miles in 1916, 36.10% were devoted to carrying the intrastate passenger and his baggage; 9.49% for interstate; in the sleeping car subdivision 19.13% of the total car ton miles of the trains were interstate, 7.84% intrastate, 13.13% mail and express, and 14.31% dining. To serve a single passenger they carry in the baggage part of the train .47 of a ton; in the passenger section of the train,

meaning coaches, 2.61 tons; for the Soo route sleepers 7.88
1588 tons, for the C. & N. W. and C. M. & St. P. sleepers 14.64 tons, and D. S. S. & A. sleepers 6.36 tons per passenger mile on the average. The highest proportion of tonnage to the passenger is on the interstate trains 3 and 4 and 103 and 104.

The Marquette & Western line is the so-called south track Marquette to Eagle Mills and part of the line to Winthrop Junction which is 17.3 miles from Marquette. It was originally built by interests connected with the Detroit, Mackinac & Marquette to serve the ore country; that line makes practically two lines from Marquette west for a distance of 17 miles through the ore district; that track is used by every west bound passenger train originating in Marquette. It is in constant use in common service from Marquette to Eagle Mills; the north line is the old M. H. & O. line and goes straight west from Marquette.

Referring to the report of the Railroad Commission for 1885, year ending Dec. 31, 1884, the Marquette and Western filed articles October 12, 1883; was open for use June 9, 1884. The Company's report of operation from June 9 to Dec. 31, 1884, shows average receipts per passenger mile 2.38¢ for all freight 2.20¢, through freight 2.15¢. 302,000 out of a total of 317,000 tons of freight hauled were ore. The average amount received for each ton hauled was 39.05¢ and the ton miles of through freight 5,349,061, and local freight 283,764, totaling 5,632,825. The number of passengers was 28,613, the passengers mile 304,411. The total income was $134, 328, being passenger $7,281.59 and freight $124,483.27.

The M. H. & O. report shows the following statistics for the entire year 1884; total tons of freight 870,749, of ore 765,199 total ton miles of freight 25,767,000. Receipts per ton hauled 81¢ per ton mile through freight 5.7¢ and local freight 2.6¢. The average rate per passenger mile was 3.7¢ being for through passengers
1589 3.95¢, and local passengers 3.66¢. The M. H. & O. report for year ending Dec. 31, 1883 shows average rate of fare per passenger mile 4¢, being the same for through and local. The rate per ton per mile was 3.41¢ being through freight 6¢ and local freight 3.24¢. The average received for each ton hauled was 81¢.

The report of the Marquette & Western for 1885 states that all the shares of its capital stock are in the treasury of the M. H. & O. which is to operate it perpetually, and that possession was given in May 1885. In the balance sheet of the M. H. & O. for 1885 under the classification "Other Investments" the M. & W. is listed at $2,011,346.93.

I have before me the report of the D. M. & M. for the year ending Dec. 31, 1881, which has a bearing on the original cost of construction on the portion of plaintiff's line east of Marquette. It states that the main line from points St. Ignace to Marquette 151.90 miles was completed and turned over to the Railroad Company Dec. 1, 1881. Page 9, calling for cost of road and equipment indicates that the road cost $2,528,963.62, being, construction, $2,350,972.97, and equipment $177,990.65 or $16,638 a mile. The items are:

	1, grading and masonary	$569,403.94
	2, bridging	133,819.86
	3, super. tructure, including rails	1,349,892.28
	4, land, land damages and fences	72,431.77
	5, passenger and freight stations, woodsheds and water station	32,565.49
	6, engine houses, car sheds and turn tables	23,178.68
	7, machine shops	3,098.76
	8, interest paid during construction, discount, etc., no return made for it.	
	9, engineering, agencies, salaries and other expenses during construction	133,873.65
	10, all other items charged to construction not enumerated above	32,708.54
1590		
	11, total expended for construction	2,350,972.97
Item	14, locomotives	61,843.43
No.	15, snow plows on wheels	
No.	16, passenger, mail and baggage cars	28,369.32
No.	17, freight and other cars	78,021.05
No.	18, machinery and tools	9,756.85
No.	19, total for equipment	177,990.65

Those figures were crossed out with red ink and a note placed at the bottom of the page which reads:

"The road was built by construction companies who received in payment therefor the stock and bonds of the railroad company."

(Report of the D. M. & M. for 1881 marked Defts.' Ex. 316.) The property was then carried carried into the report at $12,041,-892.01, or about four times the stated cost of construction. The report includes 13.5 miles for sidings.

Plaintiff's railroad was extended west from Michigamme in 1886-7. The Railroad Commission for 1887 reports as follows:

"The Duluth, South Shore and Atlantic Railway Company has also been formed by the consolidation of the Sault Ste. Marie and Marquette and the Mackinac and Marquette Companies of Michigan; the Wisconsin Sault Ste. Marie and Mackinac of Wisconsin and the Duluth, Superior and Michigan of Minnesota. The above consolidation gives the Upper Peninsula a through line from the Soo, there connecting by bridge now nearing completion over the Sault Ste. Marie river, with the Great Canadian systems of roads to the Atlantic and at Duluth with the Northern Pacific to the Pacific Ocean. This Company also has the work of construction well in hand and will soon be ready for the immense traffic that must of necessity come to it with the completion of its through line."

(Defts.' Ex. 317, being the articles of consolidation, of the
1591 Marquette & Ontonagon and Houghton & Ontonagon Railroad Companies, forming the M. H. & O. filed Sept. 2, 1872, produced and introduced in evidence. This exhibit same as Defts.' Ex. 55 before the Master.)

"Mr. Tracy: I might say to the Court, so there will be no misapprehension, that it shows by the record in the case that that figure of nearly Fifty Million Dollars is not claimed by us, and never has been claimed by us, to be the value of this road. It is a one column figure which is arrived at by the old system of bookkeeping, on which they set out their investment in the road and everything they added they added to that column and they never took anything off; so the result of it is, it is absurd to show this Court that enormous sum. After the Interstate Commerce classification was adopted, they changed their method and now add only the net amount.

Mr. Wykes: Do you now admit Mr. Tracy, that you claim nothing for your cumulative figure or investment?

Mr. Tracy: Nothing.

Mr. Groesbeck: You set up there interest on these Fifteen Millions of bonds as a charge against this property, the interest on them as one of these obligations and debts?

Mr. Eldredge: We do.

Mr. Groesbeck: You claim that that money went into the corporation?

Mr. Eldredge: I don't claim anything about it, for I don't know anything about it, only what our books show. We claim it is a lien on that property."

The articles of the Mackinac & Marquette Railroad recite a sale on mortgage foreclosure of the D. M. & M. to Hugh McMillan in 1886
for 1,010,000+, that the property was carried into a new cap-
1592 italization of $3,040,000.

(Defendants' Ex. 317 is the articles of the Duluth, Superior & Michigan; Defts.' Exs. 313-317 introduced in evidence.)

Cross-examination.

By Mr. Tracy:

I do not mean that trains 3 and 4 and 103 and 104 do not carry intrastate passengers. I stated that they were of the character of an interstate train and passengers do travel on them between local points in Michigan. So far as they run on the South Shore tracks, the run is entirely in Michigan. The south line Marquette to Eagle Mills is used as a loop or double track.

1593 CRESCENT A. PARKER recalled.

Direct examination.

By Mr. Wykes:

The operating ratios (being the percentage of expenses to revenues) of plaintiff in Michigan and outside of Michigan, on the basis of the exhibits of the various experts, are as follows:

Year.	Outside Michigan			Michigan.		
	Delf.	Parker.	Hillman.	Delf.	Parker.	Hillman.
	%	%	%	%	%	%
1914.....	96.78	98.02	100.06	77.87	77.67	78.42
1915.....	111.40	111.56	111.20	76.39	76.37	77.55
1916.....	89.87	91.45	91.10	67.89	67.67	68.03
1917.....	97.84	99.45	98.84	71.64	71.30	71.52

I have recently analyzed plaintiff's accounts for the years ending June 30, 1914 to 1917, inclusive, and separated them to states and services, the results of my separation being set forth in Defts.' Ex. 325.

In general, expenses have been allocated to states and to services to the fullest extent possible, and, where accounts were not allocated, we have used the nearest possible use basis we could find to assign to states and services. The system totals are the same as Mr. Delf's. Mr. Delf and I are agreed on most of the allocated accounts.

After making such allocations as were possible, and then dividing such further accounts as possible on some basis that represented the use for specific accounts, the proper basis and basis used, for the remaining common expenses in the maintenance of way group was the gross ton mile and time basis.

In that group, in 1917, $301,025 was assigned on the gross ton mile basis, and $103,605 on the time ratio.

Referring to pages 695 and 696 of Defts.' Ex. 325, 1917, summary of expenses, the first group is maintenance of way and structures; on the system total I agree with Mr. Delf throughout; the next
1594 column, total expenses for Michigan, is my result after separation between Michigan and outside of Michigan. My total for this group is $1,986 less than Delf's Michigan total for the same, the principal difference being found in the accounts 231, Water Stations, 233, Fuel Stations, 235, Shops and Enginehouses, 247, Telegraph and Telephone Lines, and 275, Insurance. The reason for the difference is that I accept the facilities represented by the first four accounts as being system facilities, and assign them to Michigan on a basis of use, regardless of the geographical location of the structures; e. g., the principal shops are located in Michigan, but I have assigned them on some near factor or basis of use.

The same is true of the other accounts mentioned, water and fuel stations being assigned on the use of fuel in and out of the state, and shops on a ratio of use represented by the repairs therein for Michigan and outside Michigan, and enginehouse expenses on the ratio of apportionment of the expenses of yard and road locomotives between states. Telegraph and telephone line expenses were first divided to freight and passenger on the basis of time and freight and passenger train miles respectively in states.

The differences enumerated would also make a slight difference in the items assigned as overhead, e. g. superintendence.

Under maintenance of equipment, page 697 of Defts.' Ex. 325, I have assigned $252 less to Michigan than Delf has, this being due

to the assignment of the accounts, repairs, depreciation and retirements of work equipment, which are assigned by each of us as overhead to the maintenance of way group.

Under traffic expenses, page 698 of the exhibit, there is no difference between Delf and me in Michigan totals.

Under transportation expenses, page 700 of the exhibit,
1595 I am $5,797 less than Delf for the entire group assigned to Michigan, the greater part of the difference being in accounts 392, Train Enginemen, where I accepted the engine mile basis for the division to Michigan, and 401, Trainmen, where I accepted the train mile basis for the division. Mr. Delf claimed location for 392 and 401. I rejected this, as he totaled the time spent by enginemen and trainmen outside of Michigan and deducted it from system totals, the result being that delays in traffic on account of connections and duty time would all be left in and increase the Michigan portion of the expense.

My method and result is to distribute the duty and delay time over the entire system. Thomaston, the division point, is about 14 miles into Michigan; there, engines and cars are changed for certain trains and crews are required to report 30 minutes in advance of the run, which is duty time; there would be duty time at the other end, but the mileage is a disporportionate, being 14 miles against 109. Mr. Delf divided enginemen on the time slips.

In group, Miscellaneous Operations, page 700 of Defts.' Ex. 325, there is no difference between Mr. Delf and me in Michigan totals.

In General Expenses, page 701 of the exhibit, I assign to Michigan $364 less than Delf. This difference exists by reason of the previously emunerated differences, the group being assigned as overhead to previous accounts. In the total assignment to Michigan, I am $8,402 less than Delf.

In the next (3rd) column of the 1917 summary, freight, I am the same as Delf as to allocations. Delf's exhibit, however, had no comparable column. The amount set off by Delf to expenses of maintenance of exclusive freight trackage we do not regard as allocations. I have used the equated track mile basis to divide
1596 that character of expenses. In the equated track mile basis we have taken in certain of the sidetracks and spurs on the basis of two miles of such track equaling one of main track and major branches. My ratio on that basis is ratio #2, given for 1917, on page 524 of Defts.' Ex. 325. This ratio was used to determine what amount should be set out of the common expenses to represent the total expenses of maintenance of exclusive freight trackage.

Page 524 of the exhibit shows how the equated track mile ratio is arrived at, the equation being that each mile of main line and second track are taken as one, while each mile of spurs and sidings is taken as one-half mile; treating the total equated mileage as 100 per cent, freight is found to be 17.28 per cent common, 82.52 per cent and passenger, .20 per cent. This is on the assumption that it costs as much to maintain one mile of main line track as two miles of industrial spurs and sidings. The application of the percentage is found on page 545 of the exhibit.

The total amount set off to exclusive freight track maintenance in 1917 was $73,538 and to passenger $851.

To compute the time ratio, Number 4 (Ex. page 527) we found the time of the passenger and of the freight trains in the use of the track. Time in movement only is shown, the non-movement time being excluded, and the time on exclusive tracks being deducted. The ratio is the use of track in switching or road service on the common track represented in the time consumed by each service. The switching time is computed at six miles per hour.

To illustrate the method of application of my ratios, using account 202, Roadway Maintenance, page 545 of Defts.' Ex. 325. Line one indicates the total expenditure shown by the company books for the entire system, $67,154. Delf's allocation to Michigan of $51,502, was accepted. This is made up of the sub-
1597 primary accounts shown. On lines 9 to 13, the separation on account of equated track is shown, the remaining common being $42,499. This common is on lines 15 to 17 separated to passenger and freight on the time ratio, number 4, above explained. The time ratio is used because practically all of the expense of the item is the result of depreciation from natural causes not associated with the movement of trains or tonnage. On lines 18 to 25 inclusive, the freight and passenger assignments previously made are brought together, producing a passenger total of $6,959. On lines 26 and following, this passenger total is subdivided to services on the basis of the total passenger train car miles, ratio number 3, explained on pages 525 and 526 of the exhibit.

In arriving at the train car mile ratio, number 3, the mileages made by the respective cars are shown, except where, as in case of mail, express and baggage, but a part of the car is used, then but a proportional part of the car's mileage is included. This ratio is used to divide common passenger expenses between the three services, sleepers and diners, mail and express, and passengers and baggage. On lines 30 and 31, the Michigan passengers and baggage expense is arrived at as $5,696. Lines 32 to 34 divide that expense on ratio 10, from page 529 of Defts.' Ex. 325, being the ratio of passengers carried one mile in intrastate and interstate to the total Michigan passenger miles.

Using the account, 202, to illustrate my difference in percentage from Delf. We start with the same Michigan total $51,502. We then differ in the amount deducted for exclusive freight. To the remaining common he applied the modified revenue train mile percentage of 42.21% passenger and I apply the time ratio of 23.09% passenger. In other accounts, where I used a gross ton mile factor, the passenger percentage was 25.98. Mr. Delf uses no ratio
1598 comparable with my ratio 3, but does use a ratio comparable with my ratio 10, there being no real difference between us on this. The net result of my computation is to attribute to intrastate passenger 70.67% of 57.19% of 23.19% of 82.72% of the amount attributed to Michigan. The amounts from page 545 are then carried forward into the summary on page 695.

In instances, as account 208, Bridges, Trestles & Culverts, page

546 Defts.' Ex. 325, there was a direct allocation to freight and no necessity of applying the equated track ratio, number 2, or any other factor

In account 218, Ballast, page 548 of the exhibit is a sample of the Michigan common divided to passenger and freight on the basis of the gross ton mile ratio, number 1; this ratio for 1917 is shown on page 521 of the exhibit. This ratio is made up of the gross ton miles made in freight and passenger services respectively on the common tracks, including switching. To construct this ratio, average weights, of the company's freight cars, as determined by scale weights, and ownership by classes, were taken. For foreign cars, tested average scale weights were taken and correctly applied to cars of the class. These weights were affected with mileage by classes to compute the ton miles.

For the locomotive, its weight including the tender and 60% of its loading capacity for fuel and water is taken and affected with its mileage in each service. For passenger train cars, we ascertained the average weight by classes, and applied that to Mr. Delf's Michigan mileage, assuming 10 tons to the train load. The tonnage of freight train traffic was furnished company.

The switching ton miles made on common track is a compilation of the ton miles of locomotives plus an average of 4.08 cars in the freight yards for freight switching for the yard move-
1599 ment, and 1.44 cars for the passenger yard movement, and 2.5 cars for the freight train switching movement, and 3 cars for the passenger train switching movement, these averages of cars for freight yard movement being determined by our men in connection with the yard tests, and for train switching by a study of the number of cars handled at way stations.

The ten tons for passenger loading was based on the assumption of about 300 pounds per passenger per mile for the passenger and his baggage and an arbitrary amount for mail and express. The train loading in freight is nearly 40 per cent of the whole, while in passenger it is three plus per cent. The passenger equipment is not materially changed by the loading, while the freight loading is sometimes two or three times the weight of the cars. I divide on the gross ton mile ratio, 25.98 per cent passenger for 1917, certain accounts which Delf divides on the modified revenue train mile ratio, 42.21% passenger for 1917. The difference, for 1917, in Delf's separations and mine is that in the assignment to passenger service I am $89,756 less.

After allocating property to the fullest extent possible, I would apply the method of time to the common property, to divide between passenger and freight. That is the use the property has had, measured by time. Before the Master we used that as one ratio or method, then showing a passenger proportion of 34 or 35%. The charge for use of property is analogous to a rent charge for use. I don't feel there is any necessity for dividing the property on the basis used for expenses. I don't think the use of the property is fully measured by the expense. Assuming the two theories correct, I see nothing

inconsistent in dividing the property on the modified revenue train mile ratio and the expenses on the gross ton mile ratio.

1600 The Master found against us on the use of time for the division of property. Assuming him to have been correct, I still think my ratios for the division of expenses are more nearly correct.

Ratio 1*a*, page 522 of Defts.' Ex. 325, is a subdivision of the ton miles made in passenger service to the several services constituting the entire business; i. e., a classification of the ton miles similar to that of the car miles under ratio 3, page 525 of the exhibit. I have taken the tonnage of each service shown, to reach a ratio or relative percentage to the total of the passenger tonnage. Those percentages are used to subdivide the passenger proportion of the expenses into sleepers and diners, mail and express, and passengers and baggage, as on lines 22-23, page 548 of the exhibit.

The ton mile ratio number 1 is applied to 212, Ties, page 548, for the reason that it is considered that the majority of expenses of renewal of ties is because of traffic—that they are worn out. I believe this, even though a tie would rot out if it never had traffic over it. The spikes are shaken so the water gets in and completes the destruction, but much of the destruction of ties on this road is caused by the cutting of the tie through rail pressure, which wears them out. The majority of the necessity of renewal falls in this group. Much tie renewal comes because before the tie is worn out the rail is ren-wed, thus destroying the tie, as it would not be economy to put a new rail back on the old tie after it had served part of its purpose. The tie would have served under that rail for a longer period than it did, but for the renewal.

Where I regard the wear as the greatest element of depreciation and of cost of maintenance, I apply the ton mile ratio, and where the majority occurs through the passage of time, I apply

1601 the time ratio. Where the tonnage ratio was applied, it was used for the division between passenger and freight of the common expenses, and also for the separation of the common passenger expenses between passenger services, to the point of getting the final passenger amount.

I divide the passenger expenses between sleepers and diners, mail and express, and passengers and baggage, while Mr. Delf uses the total passenger operating expenses as passenger, including sleepers and diners, and mail and express, excluding the directly-charged costs to sleepers and diners, meaning what is reserved and paid out because of sleeping accom-odations, and at the end Delf has eliminated the mail and express in a gross sum.

Referring to account 201, Superintendence, under Maintenance of Way and Structures, the charge as to Michigan and to the several services has been made relatively with or overhead to other accounts throughout the group. This is substantially the method adopted by Mr. Delf, and the resulting differences are caused by the mathematics of the problem; i. e. the different figures going into the totals. I charge 20.61 per cent to passenger, as against Mr. Delf's 36.07%, for 1917, and divide $4,451 as against his $7,811 of passenger to

passenger services, the difference being due to my use of the equated track basis and of the time and ton mile ratios, as against his different separation of exclusive freight track expense and his revenue train mile ratio.

I subdivide the $4,451 between sleepers and diners, mail and express and passengers and baggage, giving $2,263 to be divided between interstate and intrastate passenger, as against Delf's $7,811. The great difference occurs through my elimination of the cost of sleepers and diners and mail and express.

1602 In account 227, Station and Office Buildings, page 557 of Defts.' Ex. 325, the amount allocated to Michigan is $11,754. After arriving at the common portion of this item, on line 9, the amount $4,362, is divided on my ratio 17, which is the relation of the allocated station pay rolls for freight and passenger employees for the various stations in Michigan. At certain stations, there are employees whose duties are exclusively in passenger service, the pay roll charges for them being against the specific service and I have treated those two classes of direct charges as allocations.

Accounts 231, Water Stations and 233, Fuel Stations, page 560 of Defts.' Ex. 325, show special treatment, in that they are divided on the basis of the fuel and water accounts under transportation. This is practically the same as Mr. Delf's method.

Account 235, Shops and Enginehouses, page 561 of the exhibit, also shows special treatment, the items being regarded as overhead to repair of equipment accounts 308, 314, and 326, this method being pursued throughout.

Accounts 247, page 566 of the exhibit and 249, page 567, are subject to special treatment, as shown by the exhibit. The following sheet shows the amounts I allocate and assign on the various bases used:

1603 *Maintenance of Way and Structures.*

1917.

(Parker.)

	Total Michigan.	Freight.	Passenger.
Accounts Allocated	$70,739	$66,780	$3,959
Accounts Assigned on Equated Tracks	74,389	73,536	851
Accounts Assigned on Time Basis	103,605	79,736	83,869
Accounts Assigned on Gross Ton Miles	301,125	222,392	78,233
Accounts Assigned on Various Bases	11,945	9,424	2,521
Accounts Assigned overhead to others	31,602	25,087	6,515
Total	$593,405	$477,457	$115,948

1604 A number of items under Maintenance of Way and Structures are assigned as overhead to other accounts, being 269, Roadway Machines, 271, Small Tools and Supplies, 274, Injuries to Persons, 275, Insurance, 276, Stationary and Printing, and 277, Other Expenses. These expenses are incurred along with other expenses, and it is natural to expect they would follow in the same way. On this entire subdivision, Maintenance of Way and Structures, I have for 1917, assigned to passenger $89,756 less than Delf.

Under Maintenance of Equipment, 1917, page 585, of Defts.' Ex. 325, the only difference between Delf and me appears in the accounts 326, Work Equipment—Repairs, 327, Work Equipment—Depreciation, 328, Work Equipment—Retirements, and 333, Insurance, and is due to the fact that we both assigned the accounts as overhead to other accounts to which we have made different assignments, thus producing a different percentage.

Under the Maintenance of Way and Structures group, I deduct from several accounts a proportional charge for the maintenance of equipment on account of operations of the equipment on the tracks of the Mineral Range; e. g., under account 308, Steam Locomotives—Repairs, page 189 of Defts.' Ex. 325, line 28 shows the Michigan passenger proportion divided relatively with the total passenger train locomotive mileage on the Mineral Range and the D. S. S. & A. Here we have used the mileage on the Mineral Range being 4.39% of the total locomotive mileage, which results in a charge of $2,123 on account of steam locomotive repairs to the Mineral Range and carried as a decrease against the total charges in Michigan passenger service.

Certain D. S. S. & A. trains operate over the Mineral Range tracks, Houghton to Calumet. The Mineral Range gets the fares and
1605 this company pays the expense. It was necessary, in order to find out the cost of business on the D. S. S. & A. to deduct expenses which were off the line. 43,000 miles of the plaintiff's locomotive operation represents the mileage of D. S. S. & A. trains and of C. & N. W. trains 3 and 4 and C. M. & St. P. trains 104 and 104, between Houghton and Calumet, on the Mineral Range. This company has the entire train expense, and I have thus taken out from our expenses the proportional part that would be caused by the operation on the Mineral Range. To indicate the method and amount of expense charged out on this account, refer to summary of Maintenance of Equipment, pages 696 and 687 of Defts.' Ex. 325. There will be found a column headed "Mineral Range," and in that or a similar column throughout the summary appears the amounts charged out of the plaintiff's expenses on account of the Mineral Range operations; that figure is not included in the total figure, which is the next column of plaintiff's passenger expenses. The totals of the column shows what is excluded on account of the Mineral Range. Mr. Delf makes no similar exclusion; it is included in his total passenger.

My charges to the Mineral Range in this group (Maintenance of Equipment 1917) are $4,432, to plaintiff $104,136, total $108,568, being $3,056 less than Delf's $111,624.

Under Traffic, my Superintendence should be corrected to be

overhead to the group, which would decrease my intrastate net passengers and baggage expenses for the entire group from $13,576 to $8,356. Before the charge, Mr. Delf and I are the same.

Under the group "Transportation," account 372, Dispatching Trains, page 626 of Defts.' Ex. 325, the system total is divided to passenger and freight on the system time ratio, 42, and the freight and passenger assigned to Michigan on the basis of the freight and passenger train miles respectively, including switching operations, thus bringing slightly more into Michigan than Delf.

1606

The Michigan passenger item is then divided into its several subdivisions on the passenger train car mile ratio, 3, page 525 of the exhibit.

In account 373, Station Employees, page 627 of Defts.' Ex. 325, the common has been divided to passenger and freight services on pay roll ratio, No. 17, page 530 of the exhibit. After allocation was made to freight and passenger and checked over by Delf and ourselves, the common item, $84,073, lines 4 and 6, is the same as used by Delf. The 10% set off to mail and express is arrived at, as indicated on page 627 of the exhibit, on an investigation indicating that over 10 per cent of the item was directly incurred on account of the mail.

Account 376, Station Supplies and Expenses, is divided in the same way as account 373. There is no subdivision of items 373 and 376 to outside operations except the 10 per cent to mail and express. A considerable difference exists between Delf and myself on these items, my assignment to passenger being, for account 373, $20,792, and for account 376 $1,734 less than Delf.

On Accounts 377 to 390 inclusive, Mr. Delf and I agree on the assignment to passenger services. We agree substantially on account 391.

Certain accounts under the Transportation group (See Summary, pages 699-700) show charges to the Mineral Range passenger service for the same reason as explained under the Maintenance of Equipment account. The charges to the Mineral Range under this group are $14,522, leaving $332,208, which is charged to the plaintiff's passenger business, making my total passenger expenses for the Transportation group $25,607 less than Delf's, or $346,730. The major differences in the entire group are in the accounts, "Dispatching Trains," "Station Employees" and "Station Supplies & Expenses."

1607

Under the group, "Miscellaneous Operations," there is no difference between Mr. Delf and me.

Under "General Expenses," Mr. Delf and I have both divided the accounts as overhead to, or in the same ratio as, the preceeding groups, "I" to "VI." The difference between us, my figures being $3,646 less to passenger, is because my assignments to passenger in the preceeding groups are less.

My grand total of 1917 passenger expenses, including the Mineral Range, is $122.065, less than Delf. The results of the division of expenses for 1917 appear in the recapitulation at the bottom of page 701 of Defts.' Ex. 325, and the computations, divisions and alloca-

tions are correctly carried forward to the best of my ability. The methods used represent my judgment as an accountant.

Referring to the division of accounts for 1916, Defts.' Ex. 325, page 331, for 1915, page 161, and for 1914, page 3, the intention has been to divide each of these in the same manner as described for the year 1917. There are no differences in principle, though there may be some slight differences in the mechanics of setting it up. In 1914, there was a different I. C. C. classification, and we followed that. The I. C. C. numbering of the accounts was changed in 1915. The old Series of 1914 began at 1 and ran to 116, while in 1915 the first account is 201. Prior to 1916 there had not been such attempt at allocation on the part of the company as since, but the variations, if any, are as to minor things. I think that Superintendence under Traffic in each year should be made overhead in the interstate and intrastate division and a correction on that account made.

1608 For the years 1914, 1915 and 1916-1917, it was my purpose intent and endeavor to reach correct results.

The plaintiff's revenue for 1917 is treated in Defts.' Ex. 325, page 705. The amounts are, I think without exception, the same as Delf's Ex. 209, page 5, though I have observed the form of the revenue account and Delf has brought into his total some of the income accounts. We are in agreement in the items on page 705 of Defts.' Ex. 325. Delf's total of $1,064,800 would be produced by combining my items on pages 705, 709 and 710.

The items shown under sleepers and diners, mail and express and passengers and baggage are the same as Delf's, except I have carried those out into other columns. This is the outside revenue from business in excess of fares. There is no separation by the company of those fares derived from passengers carried in sleepers.

Delf has included in his total revenue the revenue from sleepers and diners, the same as I have before I divided. He has included the sleeper and diner expense in his total passenger expense. I then subdivide the expenses, charging to sleepers and diners the portion I say should be charged, and exclude it from the passengers and baggage proportion, while Delf, has not excluded that, but has kept them in his passenger business and has assigned them to interstate and intrastate. I have deducted from the revenues from passenger that portion of the revenue derived from sleepers and diners, to offset the revenue as far as it would go against the expense. I had deducted it before I made a division between interstate and intrastate, to determine the intrastate passenger expenses and revenues. On the other hand, Mr. Delf has included the sleepers and diners in the expenses and revenues and in his division between interstate and intrastate.

To show the amount set off to sleepers and diners, page 712
1609 of the exhibit shows the operating revenue of the sleepers and diners as $70,719, and expenses of the same as $233,223, which represents a deficiency of $162,504. There are two deductions in this income account, the first for the rental of sleepers and diners, an amount paid out by the company, and the second, a proportion of taxes. The net result is to charge the railway company with a loss of $179,867 on account of the operations of sleepers and

diners. If the sleepers and diners were included as a passenger operation, my net income would be reduced by that amount (subject to an adjustment of the revenues from those sources). To complete the comparison, you would have to restore this amount to interstate and intrastate in the proper proportion. The amount of total passenger income stated by me, on page 712 of the exhibit, as $553,480, would in this event have to be reduced by $179,867.

Plaintiff derives no revenue from the foreign sleepers. In my computation, I have attempted to separate the expenses of hauling the sleepers and take it out of the passengers and baggage expenses. In the matter of revenue, the plaintiff gets $15 a day for the round trip of the C. M. & St. P. trains over the line, Champion to Calumet, and 25 cents a mile for the run of the C. & N. W. With the C. & N. W. and C. M. & St. P. trains to Marquette and Calumet, in addition of those of the plaintiff, there is quite a piling up of trains, and it seems to me there are a good many trains running where a few would serve the purpose. Both of these other lines have a train each way with sleepers to Calumet, and there is a sleeper for each into and out of Marquette.

I have given the passengers and baggage business credit for the fares of passengers carried in sleepers, but have not charged that business with the expense of hauling the sleepers. In fact,
1610 I have charged sleeping car expense entirely by itself, and not into the passengers and baggage part. I have not taken into account but have eliminated the expense of hauling Pullman cars in the final result, to determine whether two cents a mile is sufficient rate. It has been my intention throughout to eliminate, as near as I could arrive at it, the cost because of the sleeper and diner services from the passengers and baggage business carried to earn two cents a mile.

Page 709 of Defts.' Ex. 325 is substantially the same as Mr. Delf's figures for the same items, the only differences being in the items representing rents received or paid for the hire of work equipment.

Page 710 is substantially the same as Mr. Delf's treatment of similar items, down to the first total, though from that point on I have credited a proportion of the passenger amount to the Mineral Range operations.

On page 711 of the exhibit, the item for taxes is temporary and will be revised as soon as I get the proper figures. I used the accrual basis for taxes from the reports. Mr. Delf first used that basis and has now changed to the actual tax. The result is that, from 1914 to 1917 inclusive, I have charged $15,146 more of taxes to passenger than Delf has.

Page 712 of the exhibit represents the totals carried forward. The last line of items across the sheet, "Net Corporate Income," correctly represents the balance upon my allocations to states and services. My final result is a net return for the intrastate passenger business of $394,469, subject to slight corrections for taxes, superintendence and a couple of other little errors.

The following sheets (Defs.' Exs. 325B, 325C and 325D)
1611 show groupings of the allocations or assignments by me on the various bases for the years 1914 to 1916.

THIS PAGE BOUND

1914, 1915, and 1916.

1613 PARKER.

Cross-examination.

By Mr. Tracy:

The proper figure on page 712 of Defts.' Ex. 325, to compare with Delf's final result, may be obtained by subtracting the footings of the column "Mineral Range," from the following column, "Total." This would give $346,431 as compared with Delf's $212,467, shown on page 5 of Pltf.'s Ex. 209.

PARKER.

Further direct examination:

In the division of the passenger expenses between interstate and intrastate passenger, I differ from Mr. Delf only in that I have divided the accounts, 373, "Station Employees," and 376, "Station Supplies & Expenses," on the basis of passengers carried one mile, while Mr. Delf has used ticket sales.

On page 518 of Defts.' Ex. 325, for 1916, under "Interest-Cr.," in the item of $3,999, I have included $1,684 interest on the redemption fund, which should not have been done, and which should be excluded. This would reduce the column of total passenger. It is interest of the fund put aside to redeem the coupons issued to cover differences in the fares collected. It would make a difference of about $1,180 in intrastate.

The plaintiff's modified revenue train mile ratio, 1917, was 42 21 per cent passenger, the straight revenue train mile, 48.37% and the difference, 6.16%. The difference is due to the inclusion of switching mileage made on common track. The modification is not as great as if made by adding the entire switching to the revenue train miles. The first modified revenue train mile ratio in this case was presented by defendants. It was based on plaintiff's testimony showing that approximately 39% of the time of freight trains was engaged in stational or switching service at way terminals. The modification consisted of the assumption that 61 per cent of

1614 the time was represented by the running of trains, and, increasing that 61 percent to a hundred, the difference in miles was a constructive mileage or stational element, which should be added to the train miles. To that was then added the statistical switching in yards and a percentage of approximately 34 or 35 per cent passenger was produced. Plaintiff then suggested further modifications, being (*a*) a reduction of the 39% for a claimed 15% of idle time of locomotives in stational, (*b*) an adjustment to bring in omitted yard switching, (*c*) an adjustment to exclude time on exclusive freight tracks, and (*d*) a reduction to compute the stational element on the basis of six miles per hour. That was practically the ratio adopted by the Master, and was based on 39% of the time being stational. The Master's percentage was between 43 and

44% passenger. There is practically no difference between the Master's ratio and plaintiff's present ratio.

All switching time is now computed at six miles an hour, without excluding the first hour, as heretofore. Our tests, so far as I have been able to analyze, have shown that the stational time is above 39%. The tests were made to determine how much of the stational or switching was spent on exclusive tracks and how much on the common tracks; we are in substantial accord as to the percentage which relates to the switching movement.

The tests show that 56.94% of the switching or stational time while in movement was spent on common tracks. The 56.94% took no account of the use represented by the train standing on the common track for 97% of the time. The tests did develop that for about 97% of the time, while the switching operations were going on, the portion of the train not engaged in switching was left standing on the main tracks. While this was shown in the statistics, it was not carried into the computation of 56.94%.

1615 The necessity of determining the time spent on exclusive tracks is that the expense of maintenance of exclusive tracks has been taken out of the remaining common expenses, and in finding a factor to divide the remaining common expenses the elements should relate to the common trackage on which those common expenses occurred. In my figures, where I have used time or ton miles, I have reduced my factor of switching ton miles or time down to 56.94% and included that in my totals. The balance, being on exclusive track, is thrown aside.

The Mineral Range statistical passenger miles were included with those of plaintiff during 1912 and for three months of the fiscal year 1913 (to October 1, 1912). The change came under a contract of October, 1912, under which they operated their trains over the Mineral Range the same as now, except they paid it a track right privilege and retained the fares.

Defts.' Ex. 326 correctly sets forth the statistics and percentages shown on it, being the number of interstate and intrastate passenger miles. This shows a marked falling off of interstate passenger miles in 1915 as compared with previous years. In 1912 and 1913, the number of interstate passenger miles was approximately 11,500,000 each year, in 1914, 13,400,992, and in 1915, 12,757,022; in 1916, they dropped to 8,597,088, and since that time they have not reached ten million. I believe this falling off is entirely due to war conditions shutting off immigration and the return of foreign population to home countries. Before the war, plaintiff ran emmigrant trains.

In examining its statistics to 1913, I found many prepaid orders for tickets, it being the custom to that time for persons in this country desiring their freinds come across to this country to purchase

1616 prepaid orders, being orders for railroad and boat fare for persons desiring to come this way; there has been a marked falling off in this business in this period; in fact, it is now very small. I know of no other condition to which this marked falling off and continued low amount of interstate passenger miles

could be ascribed, unless it is being routed over the Soo Line, which also belongs to the Canadian Pacific. There was a falling off of over four millions, 1914 to 1915, in intrastate passenger miles. The year 1914 was testified to by Delf as having a great volume of business in the Copper Country, and I don't think that a fair year for comparison, they having had over a million passenger miles of soldiers.

I have, on Defts.' Ex. 326, computed a ratio for the proportion of intrastate passenger miles to the total, based on average statistics for five years. The exhibit shows computations and comparisons on the basis of the relations between the interstate and intrastate passenger miles having remained the same and the actual conditions through their having fallen off due to the facts testified to.

(The Court called attention to the fact that there was an apparently abnormal change in statistics of 1914. This led to the revision of the exhibit, which is again referred to later.)

Since 1910, there has, with the exception of 1914, been a gradual falling off of interstate traffic, down to the last year. Even for 1914 the aggregate is not as high for interstate as it was in 1910, and 1914 is less than 400,000 higher than for 1911. The 1915 interstate was about 24% below the average for the previous five years; while the 1915 intrastate was 2.5% below its average for the previous five years, if the Mineral Range mileage had been included in 1915, as in some years previous, there would probably have been no falling off in intrastate.

1617 The permissible interstate rate on this road, 1910 to 1917, has been constant, so that the increase in passengers cannot be attributed to change in rate. During this period, the rate actually charged intrastate passengers has remained constant.

PARKER.

Cross-examination.

By Mr. Tracy:

I began my work of analyzing plaintiff's accounts for 1914 to 1917 by going to Marquette, March 18, 1917, and remaining thereto to November 1. I was furnished access to all its books and records, and whatever material Delf had. I had two people helping me. Mr. Hillman was there, and he had a force varying from 10 down to five. We were furnished the statistical matter shown in Pltf.'s Exs. 202 to 205 the latter part of April. In April we were also furnished Delf's computations of operating expenses and revenues and operating results, 1914 to 1916.

While these statistics and computations were, in general, in the same form, the figures have been changed some. In general, in dividing plaintiff's expenses to find the proper amount attributed to the intrastate passenger traffic, I followed Mr. Thompson's methods. I would give substantially the same arguments and reasons as given by him.

The question of the use of common tracks in switching arose after Thompson's testimony; I have brought in the ton miles and time; I apply them to the division of the same accounts to which he applied them, without deviation. In assigning expenses of exclusive freight track, he used a three to one equation. I changed it to two to one. The $73,538 which I assign to exclusive freight tracks is assigned through the use of the equated track ratio. Other amounts were assigned overhead on the basis of those assignments and some were allocated. I don't think the total amount attributed by me
1618 to Maintenance of Exclusive Tracks would equal $91,000.

Page 527 of Defts.' Ex. 325 shows the time ratio. The adjustment made or compensation allowed to the freight trains for the amount of time they spent on passing tracks waiting for passenger trains, and vice versa, does not appear.

Thompson testified that in preparing his ratios he assumed 2.75% of the time of freight trains waiting for passenger trains. I did not use that same figure, but made independent study, and the factors were somewhat different. I found the passengers delayed the freights 1.68% and the freights delayed the passengers .025%. We are not necessarily in disagreement, as our computations relate to different periods. My computation on page 527 of Defts.' Ex. 325 shows passenger trains running about 24 miles per hour and freight trains at a little less than 10. The figure of 2.0227 for mixed trains should be 2.9227 minutes per mile.

By this time ratio, number 4, I measured certain items of expense, by comparing the amount of time passenger and freight trains spent between terminals. Assuming a passenger and a freight train both started from St. Ignace at the same time, and the passenger train went enough faster than the freight so it reached Marquette, turned around and went back to St. Ignace, completing the double trip over the road at the same time that the freight arrived in Marquette on its single trip, according to the time theory, the use of the common property by those trains would be the same. The passenger has had the same number of hours' use of the property that the freight train has. In common with Thompson, if in my opinion the cause of the majority of the expense was due to weather I applied the time ratio, and if it was due to wear I applied the gross ton mile ratio.
1619 Of account 373, page 627 of the Exhibit, I allocated $79,331 to freight and $11,413 to passenger, leaving $84,073 common, wheih I apportioned between passenger and freight on the relation of the allocated part. This was on the theory that you might expect the common work to have been rendered for the two services in the proportion of the allocations. The allocations were at the Soo, St. Ignace, Marquette, Negaunee, Ishpeming and Houghton. These are the larger points on the line, which are big enough to afford separate passenger and freight forces. It would follow that these proportions were established to divide the expenses of an agent at a point like Wetmore.

The passenger proportion of the station expenses at the Soo does not appear in the Station Employees account, but in the Joint Facilities account.

St. Ignace is a town of three or four thousand. It is a main transfer point on the line; freight has to be rebilled, and less-than-car load freight consolidated, and they have a large force; I don't know how many in the transfer portion or how many for the local freight.

Marquette is a main division point, and all freights into it are broken and made up again for sending out on the different divisions.

Ishpeming is the transfer point of the C. & N. W. A large part of their freight is rebilled, and carload freight consolidated, there; they maintain a transfer point and sheds there jointly.

At Houghton, there is a connection with the Mineral Range and the Copper Range.

There is a consolidation of freight at all these points, more or less, and rebilling and transferring, the same as done at
1620 Champion, Sidnaw and other points.

The expenses of the agent of the Marquette coal docks are kept in the Station Employees account.

"Q. So you have taken the allocated expenses at the Soo, where the allocated portion of the passenger is not at all representative of the total passenger expense; you have taken the allocated expenses at St. Ignace, where necessarily a large part of the freight expense must be due to the fact of it being a transfer point; and the expenses at Marquette, Ishpeming, and Houghton, where a large part of the freight expenses must necessarily occur, being a transfer point, and used that as a measure for determining the division of the expenses of the agent at Wetmore and Seney?

A. Not solely, there; I have used it for the division of expenses for every station, and that includes Wetmore, Munising, Junction, and every other terminal or exchange point—everything.

Q. And the result of that is that only about 12 per cent of the Wetmore agent's salary is assignable to passenger, is that it?

A. I should think that would be about a fair proposition for Wetmore too.

Q. Based upon those allocations which I have called your attention to?

A. Based upon my notion of it."

The taxes for 1917 are not yet levied. Upon the question of use for the fiscal year 1917 of taxes paid for 1915 rather than 1916, the tax rate in Michigan, in the odd year is generally higher than the preceding year. The efforts of the Tax Commission in equalizing property in the past few years has also disturbed the average
1621 rate, and, other things being equal, the 1917 tax might not be heavier than 1916. I have taken taxes on Delf's accruals, as shown by the books, and he has taken the estimated basis, with the result that my taxes for the four years are $15,000 more than his. I intend to change this.

As shown on page 712 of Defts.' Ex. 325, of the total passenger operating expenses, about 36% is assigned to sleepers and diners and 12% to mail and express. The amount to be assigned to those services would vary with the total passenger operating expenses. Delf's passenger operating expenses are larger than mine, and, subdividing his passenger operating expenses between sleepers and

diners, mail and express, and passengers and baggage, on my percentages, would attribute an even greater loss to sleeper and diner business. On his figures, by the use of his train mile ratio, about $43,000 more would be assigned to sleepers and diners than I assigned. If there is a loss, it would increase the loss. Mr. Delf's increased expense would increase the deficit and decrease the profits. In my assignment to sleepers and diners I assign a proportion of the haulage cost. I assign a proportional part of all expenses excepting the Traffic group, Station Employees and Station Supplies and Expenses. The result of my computation is to show that in 1917 plaintiff's sleeper and diner business was conducted at a loss of $179,867 (subject to adjustment for taxes), and a loss in 1914 of $199,141.

I don't advance the claim that the railroad should abandon that business, to save that amount of money. That is a proportional part of the passenger expenses. In regard to mail and express, I follow the same system, assigning a portion of Maintenance of Way and Structure expenses, superintendence, transportation, and items of that kind—in fact, of practically all accounts except the
1622 Traffic accounts and one or two others. My figures for 1917 show a mail and express loss of $8,616, subject to adjustment for taxes. I do not claim that you could save that by abandoning the business. That, with every other thing in the process of the division of accounts, has been put together on a proportional basis. Very little would be saved in the wages paid engineer, fireman, conductor or brakeman if the mail and express business were dropped out. There would be no saving in the upkeep of fences but station buildings would be a little different, as they are used for the storage of mail and express, and portions of them are occupied by the express companies. I cannot say as to the proportion to be saved by cutting off this business. There is a use of fuel and water for the tonnage moved, and other transportation accounts would be affected. I don't think the plaintiff has an exclusive mail and express car, though they have some in these foreign trains. The South Shore car is a baggage, mail and express car, with several compartments.

If they were starting business without the mail and express business, there would be no provision for them in the cars. Without this business, I think there would be a proportionate decrease in the weight, dimensions and expense of haulage. I don't think that you must treat the mail and express as a by product if you separate it. I don't believe I can answer that the mail and express is a by-product, on this road. The business is all interwoven, and I don't think I can say which one is the by-product of the other.

Now having the equipment, if the mail and express business were eliminated, the baggage car would not be reduced in weight, space and dimensions, but if they were getting new equipment to take its
1623 place it would very likely be reduced a certain percentage. We might put the baggage compartment in another car. The weight of the car wouldn't be reduced much if it carried only baggage. I assigned no part of the baggageman's wages to mail and express.

Page 330 of Defts.' Ex. 325, 1915, shows the total net return from freight as $198,437, and from passengers and baggage proportion $437,680. That comes in part from the freight operating expenses being higher than passenger and in part because the freight business dropped off in that year.

Page 160 of the exhibit, 1914, shows net freight return, $48,401. Page 516 shows net freight revenue for 1916 of $483,195.

The Master, in assignments which we contended attributed too much to passenger, assigned about one-third of the property to passenger business. In 1916, I show the freight and passenger net returns nearly the same, and for 1917 the freight return was considerably less than passenger, being somewhat due to increase in freight wages.

PARKER.

Redirect examination.

By Mr. Wykes:

If the entire passenger business were taken off the road, certain of the costs—e. g., maintaining structure would go on undiminished and unincreased if there was nothing but the present freight business.

I do not know which is the by-product of the other on this road—the passenger business or the freight business. I think my theory of making the assignment to services on the proportional basis in direct line with the rule in the West Virginia passenger rate case and the North Dakota coal rate case, and I have intended to carry out that rule. The proportional theory is carried out from start
1624 to finish, including the division between interstate and intrastate passenger business, on the ratio of passengers carried one mile. We treat the passenger in one service as being the equal of the passenger in the other, regardless of density of traffic, though increased volume in practically everything decreases the cost per unit.

If the proportional theory is abandoned in the separation of costs to mail and express and sleepers and diners, it should also be abandoned in the division between interstate and intrastate passengers upon the ratio of passengers one mile.

1625 C. A. PARKER, recalled.

Direct examination.

By Mr. Wykes:

Referring to Defts.' Ex. 325, ratio 1, gross ton miles on common track, appears on p. 521. I obtained the ratio and computed the tonnage as follows: The mileage of freight train cars was divided into classes with respect to whether foreign or domestic and whether loaded or empty, with further division or class of ore cars. Weights were determined from, daily weighings at the Marquette scales, those given in the several appraisals, and those given by the Master Car Builders and we depended on scale weights for the average weights of foreign

cars. These particular weights were applied to classes of cars in groups according to freight mileages in Michigan. The caption to ratio 1 is "Michigan Gross Ton Miles on Common Tracks." There is no tonnage in the columns "Total" or "Freight" which is not made on the common track. I obtained these statistics from the Company. My request when I first went to Marquette was for the ton miles of traffic on the common tracks on the main line. Delf modified some of the early ton mile statistics which he furnished me in two ways: first, by a change to convert long tons into short tons in the ore business and second by the elimination of ton miles not on common track. The computation from car miles into ton miles was made by myself from the statistical records of the car miles on plaintiff's tracks. I satisfied myself that the car miles included only those made on common track having a conference with Delf on the subject. I had had experience on the road in the past, in 1912-1913, I compiled similar data. Then we computed and made deduction from the ton miles in freight service on account of the ton miles of cars, locomotives and freight on exclusive track, as we did not wish to burden the common track and mileage with ton miles on ex-
1626 clusive tracks as we were setting off those expenses by an equated track ratio. During 1917 when computing for years 1914-1917 I started to do the same thing again, and after conference with Mr. Delf, comptroller and Mr. Kemp, Auditor, I decided there was no necessity for any further reduction and made this note in my memorandum on pages similar to my previous data, on the subject for 1912-1913 "No data computed for these pages as Delf data of traffic excludes ton miles made on the exclusive ore branches." This applies to the train load and that was the figure given me for this particular year.

The third item, locomotives. Those were computed individually. Each engine's total weight in working order plus tender with 60% of its rated capacity for fuel and water was taken. To this the Michigan mileages of movement were applied. The explanation with regard to my request for statistics applicable solely to common track applies to the mileage as well as to train loading. The basic figures were obtained from the Company. Our own investigations covered the tonnage and not the miles. We did not attempt to check up with mileage but my request was specific and thoroughly understood. Throughout the computation of ratio 1, I have attempted to include in it only the things indicated in the caption "Michigan gross ton miles on common tracks."

Defts.' Ex. 337 is a tabulation to reassign (for the purpose of meeting a possible theory), expenses set off to sleeper and diner business for 1917, to the respective inter and intrastate passenger and baggage business. The first five sheets are extensions or subdivisions of ratios appearing on Defts.' Ex. 325. My ratio 1*a*, Defts.' Ex. 325, p. 525, shows the Michigan passenger gross ton miles on common tracks for 1917. The total 98,186,235 ton miles under the caption
1627 "Sleepers and Diners" on p. 522, is distributed on sheet 1 on Defts.' Ex. 337 among the several sleeper routes and diners as appears from the captions. The Soo route ton miles is the miles

of Sleepers St. Ignace to the Soo times the average ton weight of sleepers. The C. M. & St. P. and C. & N. W. ton miles, includes the foreign sleepers west of Marquette and into the Copper Country. The ton miles of D. S. S. & A. sleepers is the mileage times the average weight. The foreign diner ton miles comprehends the foreign diners on C. & N. W. and C. M. & St. P. trains west of Marquette. The ton miles of D. S. S. & A. diners is the miles of diners of the company in Michigan. In each column is included the proportion of the locomotive weight and the distances travelled and below is a distribution of switching carried in to subdivide gross ton mile ratio 1-*a*. Sheet 2, Defts.' Ex. 337, divides the sleeper and diner tonnage 97,109,603, ton miles found in my ratio 1-*b* on Defendants' Ex. 325, p. 523, between the several sleeper and diner routes and services. The difference from sheet 1 is that sheet 2 excludes car ton miles in trains not handled with plaintiff's power or crews.

Sheet 3 treats of the sleeper and diner car miles shown in my ratio 3, Defts.' Ex. 325, p. 525, and classifies into routes as indicated by the caption. The first two sheets ratio 1, 1-*a*, and 1-*b*, are ton mile ratios and sheet 3, ratio 3, is a car mile ratio. I used these to apply the same ratios as were applied in Defts.' Ex. 325. Sheet 4, Defts.' Ex. 337, is a division of switching at the various yards according to the cars handled. The sheet 5, is a memorandum to indicate what accounts were made overhead throughout the calculations.

On Defts.' Ex. 325, p. 696, I had summarized maintenance of way and structures expenses for 1917, assigned to sleepers and
1628 diners as $40,619. The first large sheet of Ex: 337 takes the items forming this amount applies the ratios found for division among routes as indicated by the column headed "basis of subdivision" and separated the items making up the $40,619 to the several routes or services indicated by the captions. All the way down the page wherever a description is given as such a ratio description it refers back to one of the previous sheets and gives you the factor by which each of these columns is produced, with the possible exception of Accounts 231, 233 and 235. When in that column the word "overhead" is used, the basis of division can be obtained by going back to the preceding sheet marked "Overhead." This sheet will explain accounts 231, 233 and 235, the percentages also being there. The next sheet, maintenance of equipment group, shows the sleeper and diner expenses divided as indicated by the numbers shown in the column "Basis of Subdivision," which compares with the basis used in Defts.' Ex. 325, upon the percentages shown on the previous sheets. This sheet in the third column, makes "Adjustment to Mineral Range," made because in the first instance I charged no part of the sleeper and diner to the Mineral Range, while I now make this adjustment attributing to it an aggregate of $407 for accounts 317 and 318.

What I have said will cover groups 4, 6 and 7 and the recapitulation.

The grand total at the bottom in recapitulation (Defts.' Ex. 337) is the total of my recapitulation for sleepers and diners in Defts.' Ex. 325, p. 701, $233,223. Following the line across the sheet the

figures represent my adjustment for the Mineral Range and assignments to the several routes or services mentioned on the basis of ton miles, car miles and every factor which I used for like purpose in distributing the total amount in Ex. 325. These totals are carried forward into the next page under the subcaption "Operating
1629 Expenses" and are combined with items from p. 701 of Defts.' Ex. 325, e. g. the Mineral Range expenses of $18,954 are increased by the adjustment made to include its proportion of the sleeper and diner expenses. In the column headed D. S. S. & A. passenger, is the bringing together of items showing the total expenses of the Michigan passenger business, less the Mineral Range. The next column shows the mail and express $77,743. The various captions under "Sleepers" and "Diners" show the amounts of sleeper and diner expenses attributed to the various routes or services. On the lower half of the sheet is a "re-distribution." Under this re-distribution the sleeper expenses for the various routes are combined with the passengers and baggage expenses and are then separated to interstate and intrastate passenger, baggage and sleepers upon the ratios shown in the notes. The Soo route sleeper expenses are divided to inter and intrastate 88.64% intra, the foreign sleepers 14.05% intra and the D. S. S. & A. sleepers 33% intra.

My separation of the sleeper expenses into routes was for the purpose of getting the amounts to which to apply the appropriate factors of divisions between intrastate and interstate, those factors being shown in the notes at the bottom of the sheet. Those factors or percentages were the results of our analysis of the passenger miles in foreign and D. S. S. & A. Sleepers in conjunction with Delf's analysis. The percentage under Note (*a*) is derived from Defts.' Ex. 311, 88.64% being the percentage of passenger miles intrastate to the total riding in sleepers on the Soo route in 1917. The expense of Soo route sleepers was assigned between inter and intrastate upon that percentage intrastate.

The passenger miles in C. & N. W. and C. M. & St. P. sleepers for 1917 indicate a percentage derived on Ex. 311, of 14.05% intra-
state passenger miles to the total and that percentage was
1630 applies to separate the expenses of those sleepers to inter and intra. The percentage of passenger miles in coaches 77.34% intra was derived from Defts.' Ex. 313, and that percentage is applied to the division between inter and intrastate passenger of the common passenger and baggage expenses which I had previously divided on the ratio of passengers carried one mile, or 70.67% intra. I have now raised my percentage of intra passenger miles to 77.34%. That comes about by reference to Defts.' Ex. 313, by the fact that we have deducted the passenger miles made in sleepers from the total passenger miles in Michigan and the remainder produced a higher percentage intrastate. I have divided those expenses which relate to the train, not including sleepers, on the ratio of passengers riding in the train exclusive of sleepers. This is not exactly right because the baggage accom-odations are provided for everybody and if you knew how much the expenses of baggage are they should be divided on the basis of 70.67% to intra being the passengers carried

in your trains. In other words taking account of the fact that baggage expenses are in the $323,048 divided on the ratio of inter and intra passengers in coaches, 77.34% the ratio should be nearer the 70.34% intra as baggage facilities for persons riding in sleepers are in that. Generally speaking, on the basis of including the sleepers in passenger business, as I now do, the computation to divide the sleeper expenses between inter and intrastate is on the basis of the use of the sleepers by individual routes by the inter and intrastate passengers. In this I separate the sleeper expenses including a proportion of the locomotive from the balance of the train and then reassign this separate sleeper expense to inter and intra services each on the percentages shown on the individual route and have finally brought it into the totals of passenger, baggage and sleeper business, intrastate and interstate. The result of my computation is that a different proportion of expense is charged to inter and
1631 intrastate business than if the sleepers and passengers were not segregated from the balance of the train. The revenue of the Soo sleepers is divided on the ratio of 33% intra. The purpose was to divide the direct sleeper revenue as it was earned, and as Mr. Delf says it was earned 37.27% intra, that is about it. On the last sheet the items are combined with the income account. The diners in my treatment have not been changed by these computations. They are sub-divided into classes as foreign "and D. S. S. & A." but are not brought back into the passenger and baggage business and I have used no similar factors for dividing those between inter and intrastate. The revenue from the diners is allowed as an offset against the charges against diners. The revenues from the several services are exact and no charge has been made. The balances shown in Defts.' Ex. 337 are: Michigan passenger $378,475, D. S. S. & A. passenger $399,569, mail and express deficit $3,271, foreign diners deficit $55,775, passengers and baggage including those in sleepers $466,725. Additions are then made from the income accounts as shown on page 712 of Defts.' Ex. 325. I have put into intrastate 33% of the sleeper revenue; Delf says it should have been 37.27%. The losses on mail and express and diners are all set aside from my final result. They are not absorbed by the passenger and baggage business. The final $479,056 would have been about $411,929, if the passenger and baggage business had absorbed the mail, express and diner loss.

(Mr. Tracy states that plaintiff is willing to assume that Parker's ratios for ton miles on common track can be regarded as substantially correct. (The record shows the only objection to Hillman's ton miles is that he adds for company freight. Plaintiff claims that the first column in Hillman's factor 13, p. 218, Ex. 329 "all tracks" is correct and that there are no ton miles made on the road
1632 other than as shown in the first column.) (Mr. Hillman testified that the caption "all tracks" was an error and that that caption should appear below; just above the two items of switching. Plaintiff claims the caption correct because they insist there is no tonnage in addition to that shown in the first column and Hillman says there is additional tonnage which is made on exclusive

tracks. Hillman's and Parker's ratios are based upon the total of the second column and plaintiff is not attacking the ratio at all. The question of what is included under "all tracks" is merely to be used as the basis for an argument and the question is academic.)

Defts.' Ex. 337 is prepared upon the theory of letting the mail and express and diner services bear their own losses.

Defts.' Ex. 338, 1917, is prepared by me for the purpose of excluding from the passenger and baggage service that portion of the sleeper expenses attributable to the excess weight from the weight necessary to carry the same passengers in ordinary passenger equipment.

The third column of figures shows the actual ton miles of vehicle or car in the designated service per passenger per mile. There being for each passenger per mile .411 tons of baggage equipment moved, for each passenger in coaches 2.320 tons, for passengers in sleepers on Soo route, 6.083 tons, on C. & N. W. and C. M. & St. P. sleepers, 14.121 tons, on D. S. S. & A. sleepers 7.10 tons. The .411 times the intra passengers indicates 9,711,955 ton miles of baggage service chargeable to the intrastate passenger. The passenger miles in sleepers intrastate were computed and carried into the intrastate column at the average weight required for a coach passenger instead of at the weight of equipment actually carried for serving those passengers when riding in the sleepers on the various routes.

1633 The reduction in weight is caused by the fact that the coaches weigh less than the sleepers and that the loading of sleepers in number of passengers are very low as compared with the coaches. The passengers carried on the Soo route sleepers were a trifle less than 10 per car mile; in the other foreign sleepers, it averaged 5.04 and of that 5.04, .79% of 1 passenger per car mile was carried. The purpose of this exhibit is to show the effect if the passenger service is relieved of the burden of carrying the excess weight used in carrying the sleeper passengers. The figures in the last two columns show the tonnage of equipment required in carrying of passengers using the average weight of equipment required for passengers in coaches. The third from the last column headed "Excess of Sleepers" shows the excess ton miles used in 1917 in the carrying of passengers in sleepers. The weight of diners and of mail and express cars is shown; from the car ton miles, percentages for each service are computed being mail and express 14.06%, diners 12.46% excess om sleepers 18.16%, interstate passengers 16.23% intrastate passengers 39.09%. There is no change in the former item of traffic and no change in the former treatment of diners and observation cars. I have no factors applicable to the latter. The above was a re-distribution of ratio 1-*a*, distributing the car ton miles between the classes of service mentioned. The same process was followed with reference to ratios 1-*b*, 3 and 3-*a*, found on the second and third sheets of Defts.' Ex. 338, the notes given being self explanatory of the slight difference in treatment. The only constant item in any of these is the mail and express. The result is to exclude diners and mail and express from passenger service.

Sheet 4, "Switching in Yards" is an analysis of factors on p. 531 of Defts.' Ex. 325 and the items are here distributed on the basis of excess ton or car miles of sleeper or diner service. These subdivisions are switching applied to certain of the switch-
1634 ing and yard accounts being applied to the individual yard in each case.

The next four pages following the first four, apply the ratios or percentages to the different items of expenses separating to the service listed in the captions upon the percentages arrived at and shown on sheets 1-4.

The last page of the exhibit summarizes the expenses thus distributed, and the operating revenue and income account down to taxes. The last line shows the net result after taking out the additions and deductions shown on Defts.' Ex. 325, producing the figures which follow as being net corporate income applicable to taxes and to corporate use for dividends and interest. The figures in the first column are the same in Ex. 337 as is the case with all columns to "Excess of Sleepers." The $63,585 under column "Excess of Sleepers" does not enter into the division between inter and intra state passengers. The amount I divided between interstate and intrastate on this exhibit, 338, is $543,845, net corporate income as against $479,056, on Defts.' Ex. 325. In Ex. 338, I still have charged against the sleepers $64,831, and the difference betwen that amount and the amount in the $179,867 shown on Defts.' Ex. 325, p. 712, as sleeper has been assigned to or absorbed by interstate and intrastate passengers and baggage, while in Defts.' Ex. 337 the sleepers have been assigned into the interstate and intrastate traffic. A difference between this exhibit 338 and 337 in results is because here the baggage is absorbed and in Ex. 337 it is subject to the explanation there made. I have the distribution of taxes under way but have not distributed them so as to get a final net to apply to the property.

(The State's first claim is that sleepers and diners, mail and express should be treated as an outside service and excluded from
1635 the passenger service.)

Defendants' Ex. 326*a* refers to and modifies Defts.' Ex. 326, the question having arisen that the year 1914 being somewhat abnormal might prevent fair results.

The first (left) half of the sheet is a recapitulation and recomputation omitting the year 1914 from the average figures.

The right half of the sheet is a computation of passenger revenue requested by Mr. Tracy and should be applied in the same manner as the passenger miles on the left hand side of the page. This is mathematically accurate. I have not used the percentages on Defts.' Exs. 326 and 326*a* for anything in this case.

1636 C. A. PARKER recalled.

Direct examination.

By Mr. Wykes:

Defts.' Ex. 343 is a distribution of the 1914 Michigan property value to freight and passenger, and to interstate and intrastate passenger. The totals are taken from Defts.' Ex. 332. After inserting the allocations to freight, passenger and common services, the commonly used property in the first sub-total for the schedules listed, shown as $5,429,028, has been assigned to freight and passenger business on the basis of time (Ratio 4), for 1914, 25.60 per cent passenger. The results of that assignment are carried into the two columns, passenger and freight. The following schedules, 19*a*, 19*b*, 21, 22, 23 and 26, have been assigned individually on the basis indicated in the description at the end of the line for each item. From the sub-total immediately following this group of figures, all land items were deducted, though the deduction does not appear on the tabulation. I am speaking of the sub-total, $8,182,554, passenger $1,603,039, freight $6,579,515. Excluding the land items, the relation existing between the net figures is for the passenger proportion 21.19%, and that has been applied to the common portion of the schedules, 20, 21, 27, 29, 33, 38, 39 and 40. For schedules 30, "Locomotives," 31, "Passenger Train Cars," and 32, "Freight Train Cars," Hillman's apportionment, and for the last two items the direct allocations, are used.

The total following schedule 32, of $11,392,206, passenger $2,262,069, and freight $9,130,137, excluding land, produced the percentage of passenger, 21% and this is applied to the division of schedules 41 and 42.

The Grand total result of the Michigan valuation for 1914 is $11,674,751, $2,321,403, passenger, and $9,353,348 freight. The passenger item is divided to interstate and intrastate passenger
1637 on the ratio of passengers carried one mile in the respective services, the result being intrastate passenger equals 64.69%, equals $1,501,716.

Defts.' Exs. 344, 345 and 346 are separations of property for 1915, 1916 and 1917, respectively, and the description with reference to 1914, Ex. 343 is applicable to each of these years, the only difference being those caused by different percentages.

The figures which I put in relating to sleeper travel were the result of a careful analysis and special investigation of that travel, by counting conductors' card reports regarding every passenger mile and every passenger. It was made with the purpose of being accurate, and, while not rechecked, was carefully made. Our figures would come very closely to Mr. Delf's if we restored the mileage deducted as being made on the Mineral Range. I cannot understand why the Mineral Range mileage would not appear, even though there was some question about Mr. Delf's sleeper mileage. The statistics of D. S. S. & A. miles in those sleepers, are kept as to D. S. S. & A. operation and revenue.

We did not know of any discrepancy between our figures and Delf's when we left Marquette.

Defts.' Ex. 347 assembles the values and net corporate income from previous exhibits, adjusted for taxes in accordance with Delf's Ex. 210, and shows net returns upon the value of plaintiff's property, as follows:

Year.	Total Michigan.	Freight.	Passenger.	Passenger & baggage. Interstate.	Passenger & baggage. Intrastate.
	%	%	%	%	%
1914.....	3.83	0.48	18.02	22.98	26.60
1915.....	3.63	1.75	11.07	14.46	17.92
1916.....	7.19	6.00	14.72	19.84	20.47
1917.....	6.47	4.23	17.17	24.40	24.99

1638 I have deducted no assumed loss and have not taken into acount either of the exhibits in which I made special treatment of the sleeper business. This is based on Defts.' Ex. 325, making the correction indicated for taxes. The mail and express and sleepers and diners are excluded from the columns, passenger interstate and intrastate.

1639 GEORGE E. FISHER, a witness for defendants, produced before the Court, Nov. 28, 1917.

Direct examination.

By Mr. Groesbeck:

There were no engineering charges on locomotives purchased by the D. T. & I. and Toledo & Detroit Railroads in 1916. The freight charge would have to be added to the cost shown in the contracts.

1640 L. C. SMITH, a witness for defendants, produced before the Court, on Nov. 28, 1917.

Direct examination.

By Mr. Groesbeck:

I am Deputy Highway Commissioner of Michigan having held that office four and a half years and am familiar with the work and records of that department. It is a part of the duty of the department to build bridges, particularly in trunk line highways. I have investigated to determine the average price paid by the State for steel in the construction of bridges. The steel bridges built by the department vary from 50 to 150 foot span, and have been constructed all over the State. The average price for the fiscal year ending June 30, 1914, for structural steel in place and painted, was $3.20 per hundred, and for the year ending June 30, 1915, $3.70; for the year ending June 30, 1916, $4.94. The raise in price began at approximately the same time that war orders were placed in this country after the beginning of the European war. While our department

is building some steel bridges, we are in the main, changing to concrete because of the present inflated price of steel. In my opinion the cost of highway bridges fabricated and erected is slightly greater than railroad bridges as the highway bridges must be shipped by rail and then by wagons or trucks over country roads and the facilities for erecting highway bridges are not as modern or economical as those for railroad bridges. Railroad bridges run heavier as a rule and the fixed charges are therefore less per pound.

Cross-examination.

By Mr. Tracy:

I make my comparisons as a matter of opinion verified by consultation with men who sell bridges to us as well as to railroads. I would not say that their figures were based upon already constructed railroads. Figures of recent years would be for bridges in exist-
1641 ing railroads. I am acquainted with the country through which plaintiff's railroad runs. Considering the maintenance of traffic I think it will cost as much to install a bridge on this road now as to take it in by team haul, assuming the railroad to be built new. The cost to the department of steel purchased for the year ending June 30, 1917, in place, was approximately $6.50 a thousand.

1642 HAZEAL J. PAYNE, a witness for defendant produced before the Court, Nov. 28, 1917.

Direct examination.

By Mr. Groesbeck:

I live in Detroit and am a civil engineer. In September 1881, I went to work for the D. M. & M., my first work being the running of preliminary lines Marquette to Ishpeming and Negaunee for the Marquette and Western; at that time the line St. Ignace to Marquette was just being completed. The M. H. & O., was in operation from Marquette to L'Anse. Neither of the extensions Soo Junction to the Soo, or Nestoria to Duluth, were completed. I worked for the D. M. & M. during the fall and early winter of 1881 and during 1882 and 1883 was engaged by the Houghton & L'Anse and M. H. & O. on the construction L'Anse to Houghton. I was assistant engineer on the construction. In the fall of 1883-4 I was assistant engineer and engineer in the construction of the Marquette & Western from Marquette to Negaunee and Ishpeming.

In 1884 I became general engineer of the D. S. S. & A. continuing until in 1904. I know of the building of the L. S. & I. At that time Mr. Fitch was general manager and at first vice president and afterwards president of the D. S. S. & A. I was present at a meeting between Mr. Fitch and Mr. Mather of the Cleveland Cliffs Co. when the matter of the building of the L. S. & I. was discussed. After the Cleveland Cliffs Co. had made surveys and in about 1895 I was called into Mr. Fitch's office with a map of the Marquette Iron

Range when Mr. Mather was there. They discussed the proposed route of the L. S. & I. Mr. Mather said to Mr. Fitch, as I remember:

"Mr. Fitch, if we cannot make a contract with your company on the basis that I have proposed, we will build this railroad."

to which Mr. Fitch replied:

"Mather, you won't build that railroad, you cannot afford
1643 to, it is too expensive a proposition."

While I did not know the terms of the contract proposed, it related to ore charges. Mr. Fitch said several times that they were making the surveys as a bluff to get a term contract at a much reduced rate on iron ore.

I have never known of a railroad being built where the bridges were hauled across country by wagon. The usual method is to give the contractor time to put on his superstructure after the track reaches the bridge, often delaying track work a few days. The other method of building a road through a new country would be to build timber structures and carry the traffic on them until such times as the renewals were made necessary by age, wear and tear. If I were the engineer I would build my foundations ahead of the completed portion of the road as far as I could and hold track laying, or build temporary tracks over the bridges and carry my steel work to the site by rail in construction trains. For grading, through a place like Seney swamp for instance, the work would be carried on with a "drag line"; work of that character has been let within the last few years in county ditching for from 10¢ to 15¢ a yard. That would be a small portion of a line like plaintiff's. My experience has been that we could let the earth work on the basis of an earth classification for about 28¢. The allowance for hardpan would probably increase the cost 2¢ a yard. I think it could be done for that money at this time.

The plaintiff's road runs west through the Montreal Valley from 3 to 5 miles north of the Gogebic Iron Range and north of the towns of Bessemer, Ironwood, Hurley and a few other small locations. Further west Ashton lies about 11.5 miles away. If I were constructing new line through that country, I should locate for the local
business, of the Gogebic Iron Range, meaning particularly
1644 the freight business. The passenger business would cut some figure also. There would be considerably more local traffic along a line so located in Michigan than along the line as now located. I am at present employed by the Michigan Central Railroad.

Cross-examination.

By Mr. Eldredge:

Nestoria was the natural place for the plaintiff to start an extension west. The line had surveys and the branch track built into Bessemer at the time I went with it in 1889-1890 and I made surveys into Ironwood and Hurley. Whoever designed the road must have considered

the question of reaching the iron ore of the Gogebic Range. Its transportation would have involved going 12 miles over to Ashland or to have found some other lake port and built a line for the purpose of shipping the ore. When the plaintiff's road was built the Gogebic Range was already served by the Wisconsin Central and the Marquette & Lake Shore. I do not know what contracts these roads might have had on the Gogebic Range but if I was building a railroad I would attempt to get where the business was offered and take my chances on getting part of it. Passengers from the Gogebic Range could reach the plaintiff's railroad via Saxon over the Lake Shore, via Marengo over the Wisconsin Central. It might have been more than a question of engineering judgment to determine the location of the road. I have been doing contracting work other than railroad work for the past three or four years. There was a marked increase in the cost of labor in 1917. I think the average price of 30¢ for grading, including hardpan, would be about right for 1913-1916.

Redirect examination:

Spurs into the different mining sections of the Gogebic Range were not built when I left the South Shore road in 1904. Passen-
1645 gers from Ironwood and Hurley via Marengo and Saxon would have to travel an indirect course and many miles further than if this line went in there.

1646 ELDEN E. DADSON, a witness for defendants, produced before the Court.

Direct examination.

By Mr. Groesbeck:

I am a public accountant. I have made an examination of the reports of the Marquette, Houghton & Ontonagon, and Marquette & Western, Detroit, Mackinaw & Marquette, the Mackinaw & Marquette, & the Duluth, South Shore & Atlantic Railways to arrive at their investments and additions and betterments from 1872 to 1917 inclusive. Defts.' Ex. 319 is the result of my work. The total investment and additions and betterments for plaintiff's entire system, including Wisconsin, is about thirteen million dollars.

Plaintiff's report for June 30, 1917, shows approximately forty-eight million dollars in road and equipment, less about $900 set up for depreciation; against this investment, we have found items of obvious inflation amounting to $34,424,235.47. This is shown in the exhibit in three items, pages 8, 10 and 12, and is items charged to road and equipment account which are not properly chargeable. Page 3 of Defts.' Ex. 319 is a summary of operating revenues, expenditures and net income from operation, as shown by reports to Railroad Commission from 1872 to 1917 inclusive. Page 3 shows the reported net income from operations at $25,822,248.95.

Page 4 shows items reported as miscellaneous additions to income account of $1,385,191.35.

Page 5 shows the reported miscellaneous deductions from income account of $1,294,275.99.

Page 6 summarizes pages 4 and 5, and shows a total income of $27,207,440.30. This page shows the disposition of those earnings, leaving a deficit, as per balance sheet of June 30, 1917, of $6,532,151.66.

1647 Pages 7 and 8 list various items of obvious inflation reported by the M. H. & O. page 9 showing how the first of those items is calculated.

Page 10 shows inflations from the reports of the D. M. & M. By inflations, I mean charges to road and equipment where no money or equivalent value has been expended.

Pages 13 and 14 show, on the left hand, a computation based on the net admissible assets of the railroads, and on the right hand a computation based on the net value of the road and equipment after deducting inflations. We show the fair income from the remaining or true values calculated at the rates of interest the roads were currently paying during the years represented.

On page 14, at the right, it will be seen that the total return on investment of road and equipment for the entire system, from 1872 to 1917 inclusive, calculated at the current interest rates, aggregates $21,043,902.74. Calculated upon the net assets shown on the left hand of the income, at the same rate, shows $17,195,243.30. Dividends are shown in the disposition of earnings and surplus, on page 6, and aggregated $1,330,039.74. Allowing interest at the rates payable on their securities, upon the investment as I find it from year to year, they would have distributed $21,043,902.74 instead of approximately thirty one million, which they did distribute, which would leave the surplus, June 30, 1917, about four million dollars.

Some of the most obvious inflations are the following: Page 8 shows bonds sold to build the road from Houghton to L'Anse, at a 50% discount, with the aggregate discount of $464,037.90 charged to road account; page 7 shows a deficit on the books of the company, as reported to 1878, of $562,824.66, which is charged to road account and thus taken from the books as a deficit; page 11 shows the ex-

1648 pense of refunding the D. S. S. & A. debt, discount, etc., in 1892, to be charged to property account in the amount of $4,833,108.21;

Item 1, page 11, is based upon the fact that when the D. S. S. & A. organized, their first report, in 1887, showed road and equipment aggregating over twenty-six millions. The only road the records showed to have existed in fact was the old D. M. & M., and later the M. & M. which was bought in at Receiver's sale for approximately one million dollars ($1,010,000), and an extension of 47 miles, Soo Junction to Soo. Data obtained from the I. C. C. records at Chicago showed stock issued to promoters of the Wisconsin, Sault Ste. Marie and Mackinaw Railway of $5,820,000, and to promoters of the Duluth, Superior & Michigan Railway of $5,700,000, a total of $11,520,000. As we find no evidence of these roads being in existence

we have no reason to believe any road mileage was given for this stock. The road mileage reported by the D. S. S. & A. in the same year coincides with the mileage, St. Ignace to Marquette, plus that from Soo Jct. to Soo, or about 197 miles. We believe no road was represented by the stock issued for these items, though stock was issued and a sufficient amount added to road and equipment account to balance the ledger.

The D. S. S. & A. report for 1890 shows for the first time, first consolidated gold 4½% bonds, of $11,143,300. These were shown as being in the treasury this year and the next. In 1892, they had disappeared, and the road and equipment account, which had been shown at $28,268,918, increased to $42,093,666. I did not find where any money or property had gone into the D. S. S. & A. for that bond issue.

The D. S. S. & A. had been holding the M. H. & O. under lease, and this year they claimed to have acquired title. In 1891,
1649 they had been carrying the M. H. & O. as an investment at $6,980,532, and the M. & M. at $1,400,000. These ceased to be carried as an investment in 1897, accounting for about $8,300,000. The first consolidated 4% bonds were shown of June 30, 1917, as $15,107,000. We were not able from the reports to trace any of the proceeds of this issue into the road.

In calculating the investment in the latter years, when a depreciation reserve is shown, we deducted the amount of the depreciation reserve shown from the property values shown by the reports of the Company. The only depreciation we have allowed is that shown on their books. In making up the investment account, it was not always possible to find the actual amount the railroad claimed to have expended in building and equipping the property; it frequently happened that the accounts shown in the table of additions to plant accounts did not agree with the increase in the plant accounts themselves. We gave them credit for all the additions and betterments reported to the Railroad Commission that we were able to find; for instance, in the D. M. & M. report for 1881, we used the cost of construction and equipment, at a total of $2,528,963.62, shown on page 9, while the amount shown in the balance sheet was $12,041,892.01, treating the difference, or $9,512,928.39 as an inflation.

In the main, we accepted items of cost as reported. In cases where they were obviously overstated, we made calculations; e. g., in the case of the M. H. & O., item 1, shown on page 7, Defts.' Ex. 319, the report for 1873 states the road value at $7,088,148.64 and equipment at $1,077,421.26. As the road consisted of 84.34 miles, this seemed extremely high, and we made some calculations based upon Riggs'
appraisal of 1911. As a result of a computation based on
1650 $18,800 a mile, we deducted $5,500,000, leaving the value at $1,500,000 plus.

(Discussion and objection by plaintiff's counsel to the admissibility of proof of original cost at this time.)

Defts.' Ex. 319 is based upon the various reports of the plaintiff and its constituent companies to state authorities. I have attempted

to analyze and digest them and deduct such items as I deemed unwarranted, calling them inflations. On page 14, the first column shows the year of report, the second column, the name of railroad reported, third column, net assets less commercial liabilities and deductions—i. e., the net assets less operating and incidental liabilities. I consider bonded debt a capital liability. From that balance I deducted the inflation. Taking the year 1917, the value reported by the company, less current liabilities, less what I claim are inflated values, shows a net value of assets of $6,192,609.41.

In the next column, the result is arrived at by computing interest on amount of return upon the investment. The rate of 4.5% is taken because that is the average that the company is paying currently on bonded obligations. I thus arrive at the sum of $278,667.42 as the amount of return computed upon the value of the assets at 4.5%. On the right-hand side, the computation is made in the same manner, but basing it upon the net value of the road and equipment accounts, disregarding other assets and liabilities and deducting the same inflations, and I there find that the net value of the road and equipment would be $13,375,591.85, and that 4.5% on that would yield a return of $601,901.68. The column headed "Amount of Return" is arrived at from prior computations, taking 4.5% on the value of the property; the returns in earlier years were calculated at different
1651 rates, based upon the average paid in those years on the bonded indebtedness.

The method adopted by me in arriving at the cost as a basis for my computations with reference to the Riggs appraisal was: The value of road and equipment, as shown in the trial balance of M. H. & O., as per their report of 1873, which was the first report in which they showed that, seemed very high, and, in conjunction with Mr. Hillman, we made some calculations based on the Riggs appraisal of the D. M. & M. and of the M. H. & O., from Marquette to Houghton. We determined the ratio of cost of roadbed grading on those two lines, as shown by the Riggs appraisal, and discovered that the costs so shown on the M. H. & O. (portion of plaintiff's) lines was 77% higher than the costs on the D. M. & M. lines. Having before the cost of the D. M. & M. roadbed as shown in their report, detailed in their report of 1881, we added 77% to the mile cost as a cost of roadbed on the M. H. & O. as existing in 1873, on the theory that if the Riggs appraisal placed it at 77% higher than the other in 1913, that presumably the cost when built was approximately 77% higher than the cost of the other line for which we had the figures as reported by the road. With regard to the cost of bridges, by a similar calculation we found that the Riggs appraisal placed the per mile cost of bridges on the M. H. & O. lines at approximately 50% higher than that on the D. M. & M. lines, and having the reported cost of the bridges on the D. M. & M. lines as shown and detailed in their report of 1881, we added a mileage cost of 50% to that in arriving at the cost of bridges on the M. H. & O. That covers the method by which we arrived at the figure we have used as the cost of the road.

With regard to the cost of the equipment which we have
1652 shown in this exhibit, on page 7, item one, the detail of that was provided us by Mr. Hillman, though I checked some of it

with him, with the Riggs report and the other reports, and the detail of the calculated cost of this equipment is shown on page 9 of this exhibit. For instance, with regard to the 30 locomotives, in the Riggs valuation of 1913, he states the reproduction cost of the oldest locomotives on the line at that time, consisting of seven locomotives built in 1882, at an average cost, or cost each of $6,916. We therefore used a figure of approximately $7,000 on the thirty locomotives which were reported to be in existence in 1873.

With regard to the next item, five passenger cars, shown at $13,-300; we found in the report of the road one new passenger car in 1876 and was extended out to cost $2,736, and the five passenger cars are calculated on approximately that basis. The three baggage and smoking cars are based on a value per Riggs' exhibits, 1911, in which he shows cars number- 40, 42 and 43 at $2,500 each, the oldest cars shown by him in that report, and we used those figures in calculating this price.

In the Riggs appraisal, as shown in 1911 report, he shows the three oldest passenger cars in existence, numbers 40, 42 and 43, built after 1873, at $2,500 each.

My understanding of those figures was that they were reproduction in 1911, though I am not very conversant with the Riggs method of valuation. And as to those cars (although I do not remember the year in which they were built, yet I do remember it was later than 1873) we concluded that that was at least a liberal price at which to value the three cars that existed in 1873. The same method was followed with regard to the 28 box freight cars, the 72 platform cars, the 476 flat ore cars and the 3 section cars. With re-
1653 gard to the Harper cars shown, 1122 Harper ore cars, we found in some of the annual reports a price of approximately $240 each on some of those cars and we used that figure. That, I think, covers the items in the schedule.

As to the locomotives and passenger, baggage and smoking cars, to produce the value for 1873, we took Riggs' estimate of the cost of reproduction new in 1911 of the oldest locomotives he found on the line. We made no investigation of whether it would have cost more to build the car in 1873 or of the effect of the panic in 1873.

This total valuation is supposed to represent the actual cost at the time, as nearly as we could calculate it from the data at hand.

Cross-examination.

By Mr. Eldredge:

The operating revenues shown on page 3 of Defts.' Ex. 319 for the M. H. & O. from 1872 to 1887 at $12,000,000+ are as reported by the company. I made no adjustment of those. The information was taken from the reports of the company to the Railroad Commissioner and Railroad Commission. That is true of all the compilations I have made. The operating expenditures are also as reported by the company. We made an analysis of the miscellaneous additions to and deductions from income account, as shown on pages 4 and 5

of Defts.' Ex. 319. The taxes were taken as reported, except for 1872 and 1873, where we applied the same amount as shown for 1874.

We accepted the operating revenue, expenditures and income as shown for the Marquette & Western, as reported. Our purpose with respect to the income was to make a comparison of the actual income as reported with what seemed to be a fair income or return on capital investment, as shown on the final table of the exhibit.

1654 Apparently, the M. & W. for 1884, was operating at less than 50% of expenses to revenue. We did not go beyond the reports, or study whether they had maintained the road properly or whether there were omissions of proper charges in operating income. The D. M. & M. was operated but one year (1886) as the M. & M. The operating revenue for 151.9 miles of line was $68,000, operating expenses $47,000, and operating income $21,000. We had no information to determine whether the report was accurate or not and included all the items of expenditure, but took them as reported. The item on page 4, Ex. 319, "Balance left over for construction in 1883," appears in the inflation table as item 2 on page 10. The report for 1883 shows increases in property account, road and equipment, $279,468.48, and an increase of $250,000 not accounted for. We do find that this increase of $250,000 is offset by items referred to as miscellaneous additions to income account. This is our analysis of the report. We included this $250,000 as a part of the inflation we found. The item, page 4, "Received from the Land Department, Trustee, 1883, $23,625.20," we treat as a part of the income of the road, and it is included, not as operating income, but as an addition to income.

The return shown on page 14, Defts.' Ex. 319, is not a statement of return as reported by the railway company. The $21,043,902.74 shown on page 14 is what we calculate is a fair return on the investment in road and equipment, after deducting inflations, at 4.5% interest, or other rates which were currently paid on funded debt. In earlier years, they paid higher rates of interest. We did not go back of the reports beginning with 1872.

I was trying to find out the amount actually invested in the property. I thought it a fair way to take the estimated value in
1655 1871, without reference to time of construction. It did not enter my mind that it was impossible to do what I was attempting to do with the data at hand. The plan was devised mutually between Mr. Hillman and myself. The item of about $8,000,000 seemed excessive for 84+ miles, and we made comparisons with the appraisals.

I did not learn that the M. H. & O. to L'Anse was built to earn a land grant. There was a sale of approximately two and a half million dollars of lands at one time. It is shown in item 4, page 7. We observed the book value assets were not decreased, although this land was evidently disposed of; we found that they had decreased their liabilities by applying $2,000,500 to the payment of mortgage debts. It would not necessarily follow that it decreased the assets used in public service. It would not decrease them at all. It might have been a good proposition for the M. H. & O. to sell those lands at that

time, though they did not get the market prices that might prevail in later years. I had the justification for the insinuation that the assets were stated greater than they should be, in that the road showed certain assets on the balance sheet, and having disposed of some of them they showed no decrease. They already showed decrease of liabilities, though the disposal of the property for liquidation of liabilities would not necessarily make any difference in the net worth of a corporation, but it should show a difference in the total assets, which, in this case, it did not. Referring to discount on Houghton and L'Anse bonds, item 6, page 8, while it might under certain circumstances be a justifiable proposition to sell the bonds at 50¢ on the dollar, it is not proper to charge a discount of that kind to property account. Discount on bonds is usually amortized during the
1656 life of the bond as a charge against the operations of the years during which the bonds live, and is not properly chargeable to property account.

I treat the discount as an inflation because it is charged to property account improperly, while it is an expense item which should be absorbed during the life of the bonds.

The reports with regard to land sales, the information was very meagre, and all the information that we could obtain from them was that lands were sold at different times for a certain net amount of money. It seemed that in taking credit for those sales the charges for taxes and other legitimate charges against the lands were deducted and the net amount shown in the reports.

In our analysis of miscellaneous additions to and deductions from income account we included all items reported as additions to or deductions from income. We obtained this information from the reports themselves. The items of inflation were obtained from a study of the reports.

We obtained some information from Mr. Hillman; that which refers to the first item on page 7, the value of the M. H. & O. as shown in 1873. When I referred this item of the valuation to Mr. Hillman, he directed my attention to these appraisals and assisted us to find a ratio that seemed to establish a fair price for the road, as shown on page 9. The only information as to the fifteen odd million dollars of bonds issued to the Canadian Pacific, and the 4% bonds of the plaintiff, was that they were shown as outstanding in the annual reports at the end of each year.

I now know the plaintiff to be the owner of the M. H. & O. There is nothing in the investment of the plaintiff that represents the cost to it of the M. H. & O. The report of plaintiff shows a value of road and equipment and their ownership of the M. H. & O. 1887 to
1657 1880, as an investment, and the acquisition of the title in 1891, and in the next report they show an addition of about $14,000,000 to road and equipment accounts. It was our duty, as far as possible to find what the M. H. & O. investment was, but there was no data given us in the reports to show that, and we never went outside the reports.

I presume that upon a letter from the Attorney General the plaintiff's officials would have given me access to their books, but I was not

so advised. We made no investigation to determine what plaintiff paid for other railroads it acquired. The only thing we were able to do from the data at hand was to determine, as far as possible, how the values were made up. When the plaintiff was organized, it issued capital stock of $22,000,000, showing $325,000 of equipment and the rest in road account; of that $22,000,000, we know about $12,000,000 was issued to the promoters of the consolidated roads.

I am not an engineer, but I feel bound to use good business judgment as to fair accounts. In making up accounts, we do not accept figures regardless of how absurd they may seem.

The roads taken into consolidation showed no good will account or anything of that kind, and, of course, we were not called upon to investigate it.

Pages 13 and 14 of Defts.' Ex. 319 show a decrease in net assets to approximately $6,000,000 in 1917, and an increase in net value of road and equipment to approximately $13,000,000 in 1917, the decrease being caused almost wholly by continual book losses showing a decreasing net worth.

As shown by their books, the company was losing money all the time. The fairer deduction, and the most liberal one to the railway, is on the right hand side of the page, where we show an allowance of

1658 an income equivalent to the income on bonds on their investment in road and equipment. This is the computed income mathematically fixed by me. These figures are all based on the figures presented by the railway company itself, deducting only those items considered obvious inflations, and the investors then allowed on a fair basis the rate that the bonds paid, and if they obtained that rate on the investment they would have obtained, 1872 to 1917, $21,000,000 plus.

We considered that would be a fair return. If the road was worth $10,000,000, bonded for the same amount, it would belong to the bondholders, practically. It would be clear the stockholders had no investment in it, regardless of whether they paid more for it or not.

The purpose of Defts.' Ex. 319 is twofold, first, to refute the claim that there is a deficit of $6,500,000 in the operations of this road, and second, to show the value of investment in road and equipment. The sole purpose of computing the interest or amount of return is as bearing upon the deficit.

1659 CLEMENT C. WILLIAMS, a witness for defendants, produced before the Court, Nov. 1917.

Direct examination.

By Mr. Groesbeck:

I am and have been connected with the University of Kansas, as professor of railway engineering, for four years. Previously, I was assistant professor and later professor of Civil engineering at the University of Colorado. I have had actual experience in engineering work connected with railroads for about six years, with the Delaware, Lackawanna & Western, the Chicago, Milkaukee & St. Paul, and the

Illinois Central, in the engineering department. I am a graduate in civil engineering of the University of Illinois.

I have done research work pertaining to the problems relative to track maintenance in connection with my work at the University of Colorado, and more particularly in connection with my work at the University of Kansas; that has extended over a period of about four years.

My attention was first called to the matter of stresses in track, and the effect of traffic on track, by observing some broken angle bars lying alongside of the Colorado & Southern Railroad, and I took those into the laboratory and made a careful examination and observed they were fatigue failures; the steel had failed by fatigue rather than by being over-stressed; that is, rather than by stress beyond the ultimate strength of the material. I made a further investigation of the subject in which we put a scientific apparatus on the track and measured the deflections of the track under traffic; the stresses in the rail due to the presence of traffic. For the purpose of measuring the deflections of track under traffic, we devised a Traffic Deflectograph.

1660 (Question raised by counsel of the right of defendants to produce proof of the effect of traffic on track at this point in the case, it being claimed that additional proof could not be put in. The proof was admitted as applying to the division of accounts 1914-1917 inclusive and as applicable to theories previously or subsequently advanced.)

My work in of research was not connected in any way with any issue or trial between railroads; it was carried on as a scientific research in connection with scientific studies of the University, purely for the purpose of furthering the knowledge of track maintenance,—the science of railway engineering.

The first piece of equipment that we used, as we call it, the track deflectograph, was a device we constructed at the University for measuring the deflection of the track under the passage of trains. It consisted of a framework of pipe anchored entirely outside the roadbed, to which were attached four cylinders, which could be rotated and which carried sheets of paper on which a record was made. A pointer attached to the rail made a mark on the upper part of this paper chart as the rail was deflected, recording exactly to scale the deflection of the track. At the bottom of the chart was a secondary pointer which indicated by means of electric contact the position of the wheel with reference to the diagram that was being made at the top, so that it was possible to relate or connect up the diagram that was made by the deflection of the track with the position of the train wheels at any time. That gave qualitative results largely rather than quantitative.

The second piece of equipment we used is a commercial equipment called the Berry Strain Gauge. It is used generally by all of the scientific laboratories throughout the country, Universities and other places, for measuring stresses in any piece of material
1661 when it is under load. This is attached to the flange of the rail and enables one to read the stretch or the deformation of

the rail exactly. The two pointers at the bottom of this equipment are inserted in small holes in the flange of the rail and 8 inches apart, and a dial which is about the size of the face of a large watch, has recorded on it by the pointer there the amount of stretch of the rail in that 8 inches, and from that stretch or deformation it is possible very simply to calculate the stress in the rail, because a steel rail is a piece of elastic material and it is possible very simply to calculate the stresses in such materials. This piece of equipment was used for getting what I might call quantitative results, that is, actual stresses in pounds per square inch in figures.

Most of the observations were made on the Santa Fe Railroad, near Lawrence. A number were made on the Union Pacific, a few on the Missouri Pacific, and quite a number on the Interurban Railroad, the Kansas City, Kaw Valley and Western. We took these latter observations for the purpose of finding behavior of the track under trains which were not pulled by a locomotive, that is, under the cars themselves.

I supervised and was present at practically all of those investigations and tests; all of the blue prints are contained in Defts.' Ex. 320, lettered from A to Q, omitting J.

Sheet A is a chart taken by the deflectograph and shows the deformation, the depression of the track under a passenger train, which was operated over the apparatus at 40 miles per hour. There are four charts on the sheet and each one of these was taken
1662 by one of these cylinders that I spoke of, which was located at the middle of the rail; gauge number 4, near the joint and gauges 2 and 3 were at the intermediate points on the rail; so that the record is the entire half of the rail as the train passed over it. The dots down below indicate the position of the wheels and I have interpreted the mean of those dots by sketching in conventionally the wheels above.

Charts B, C, and D are similar in general purport, although somewhat differently drawn up, inasmuch as the interpretation of the wheels is not shown, but from these charts which represent passenger trains operated at various speeds I drew the conclusion that the deflection was not increased under trains operated at higher speed. The deflection or depression of the track was not increased by virtue of the greater sped of the trains. The speeds are indicated on the chart, varying from 25 to 52 miles per hour.

Chart E is taken by the same apparatus, but under freight trains. It shows particularly an interesting observation, and that is that here is a tremor in the track under freight trains that does not exist under passenger trains. This is probably due to the eccentricity of cast wheels as distinguished from turned steel wheels, as will be shown by a chart later in the exhibit. That is shown by the very small waves in the line. The major waves or vertical movements of the chart indicate the general depression of the track, whereas in addition to that general depression of the track there is secondary tremor in the track due to a vibration apparently, and that is indicated by the small vibrations, or the small waves, we might call them.

On Chart F, I have scaled off the actual deformations from these

preceding charts and from others, of which these are typical, and platted these deformations against speed and those show what
1663 I stated awhile ago to be true, that the deformation is not increased by virtue of speed under the same twpe of equipment. The speeds of freight trains are nowhere here shown.

Chart F refers only to passenger cars of the same type; not to the locomotive at all. Chart G is platted in a similar way to chart F, but refers to the depression of the track under the locomotive, scaled under the chart, made by the rear driver of the locomotive, and the trailer. The trailer is, as well known, the wheel following the drivers and supports a load practically the same as the drivers, but it is merely a supporting wheel, not used for driving the locomotive.

The upper figure in chart G is one type of locomotive; the Pacific or Sante Fe type, 3500 class, all of the same weight of locomotive; and the lower figure on chart G refers to the 1400 class, or Atlantic type of engine, all of the same class.

Chart G shows, incidentally, the difference in deflection under the driving wheel and under the trailer.

The scale of deflection in inches is indicated at the left. In the upper figure the deflection of the trailer is twenty-five hundredths of an inch from the normal position of the track; the track is pressed down twenty-five hundredths, or ¼ of an inch under the trailer and a little more than that under the driver. The figures, .300 and .200, at the left, merely indicate the scale of the chart. The distance between the 200 and the 300 represents just one-tenth of an inch. The position of the top rail if there were no weight upon it, is not indicated for the upper chart nor for the lower chart, it would be somewhere below the bottom of the sheet.

The actual deflection is indicated, the amount being in-
1664 dicated at the left in figures, that is in the upper chart the deflection of the trailer is uniformly twenty-five hundredths of an inch. It is half way between two tenths of an inch and three tenths of an inch, or a quarter of an inch. The reference line is not shown on the chart, but the amount of deflection is shown at the left in figures and it is drawn to scale, and the same is true with the lower chart, the deflection of the trailer, uniformly twenty-two hundredths of an inch, does not vary with the speed, the actual amount of deflection being shown at the left margin of the diagram, of the coordinate.

Those figures at the extreme left show the scale of the diagram and aid you in measuring the deflections shown on the diagram.

Chart H represents the stresses obtained by the Berry Strain Guage, the second piece of apparatus which I described, and these are actual stresses under passenger traffic operated at various speeds. It is shown there that the stress does not increase with the speed.

As a matter of fact the observations that are there platted which constituted all that I had of that series, really show a decrease in the stress due to speed, but I have indicated there in a broken line, a dotted line, what the probable average curve would be if more observations had been taken. It will be observed that at 60 miles an hour and at 40 miles an hour there was only one observation taken. If

more had been taken I should have expected them to be distributed somewhat as they are at the lower speeds, which would make the curve more nearly horizontal, as will be shown in another curve that I have here. When I say stress, I mean the actual strain in pounds per square inch. In this case, it was exerted horizon-
1665 tally, the pull on the bottom of the rail, tending to rupture the rail in tension by pulling it apart at the bottom.

Chart H literally interpreted, would show a decrease in stress with an increase in speed. That fact is not in harmony with other observations that we have taken, and so I drew a horizontal line, labeling it the probable average curve, if more observations had been taken, because our other observations did not show a decrease in the stress; neither did they show an increase in the stress, although this particular set does show an increase (Decrease) but I think it is due to the fact that we have so few observations in this series around 60 miles an hour. If there had been more at that speed, they would have been scattered, probably, and would have raised that end of the curve.

Chart I represents a similar graph or plat of stresses under electric interurban cars, all of the same type. I made arrangements with the general manager of this interurban railroad to operate the cars over our apparatus at various speeds, as we should indicate to the motorman, and we found in this case also that the stress in the rail did not increase in a general way with the speed, the speed apparently having practically no influence on the stress. These points are scattered, as one might expect, because the exact stress depends on the lurch of the car as it happens to pass the equipment, but the average curve does not show an increase in stress with the speed. I have other charts here, showing records of other experimenters, made independently for other purposes, which corroborate the conclusions that I drew from the test that I made myself. The remainder of these charts represent the results of these other experimenters.

Chart K is a record made by the Committee on Iron and Steel Structures of the American Railway Engineering Association, an association of engineers, and represents a part of the results
1666 of a very extended series of experiments. The lower chart in particular is more easily understood in this, because it brings out the point more distinctly. In order to explain this, it is necessary to say a word about the counter-balancing of locomotives. In explanation: a freight locomotive is counter-balanced for the speed at which freight trains operate; a passenger locomotive is counter-balanced for the higher speeds, that is, for the speeds at which passenger trains are supposed to operate. It will be observed from the chart, with this in mind, that the passenger locomotive does not cause a large increase in the stress in the rail until a certain speed has been passed, approximately that speed for which the engine was counter-balanced, but that the speed for the freight locomotive causes an increase in stress because the freight locomotive was counter-balanced for a lower speed; as a matter of fact, under 58 miles an hour in this case, the increase in stress due to speed, that is, due to

impact, was the same under the passenger locomotive as under the freight locomotive at 20 miles an hour, and that conclusion was made by the Committee and can be found in the proceedings. They arrived at that same conclusion.

Chart L represents the effect of impact due to counter-balance on locomotives that are counter-balanced for passenger train speed that are well adjusted for operating at passenger train speeds, and they show that under about 48 miles an hour for steam locomotives the effect of impact did not exceed in any case here about 8%. They illustrate the fact that the increase of stress under the locomotive is due to improperly adjusted counter-balance, and that is entirely in harmony with the conclusions that we drew with regard to the stresses under cars where there is no counter-balance; that is, that there is no increase in stress.

1667 Chart M represents the results obtained by a series of experiments carried on under the direction of Dean Turneaure, at the University of Wisconsin, showing the effect of impact at various speeds, when the effect of counter-balance has been eliminated, and Dean Turneaure's conclusion, as quoted in the transactions of the American Society of Civil Engineers, is to the effect that speed in itself does not increase the stress in the bridge, but that the increase that does result from higher speed comes from the counter-balance.

Chart N shows the relative effect of passenger trains and of a freight train passing over the same bridge, the passenger train at 40 miles an hour and the freight train at 28 miles an hour. This is an actual chart that was traced by a pointer attached to the member of the bridge as the train passed over it. It illustrates the fact that the freight train causes an intense vibration, which is not apparent or which does not appear in the passage of the passenger train, and that was a conclusion which Dean Turneaure drew from his tests.

Chart O shows the results of the Committee of American Railway Engineering Association appointed to investigate the effect of flat wheels on track and track structure. At the left is shown the actual amount of stress in pounds per square inch, while at the right of the chart the scale indicates the per cent of increase of the stress due to the flat spot. This test was made by loading a freight car of 80,000 pounds' capacity and operating it with two flat wheels. I mean by a flat wheel a wheel with a flat spot on it, such as frequently occurs in freight train operation. The flat spot was 2½ inches long, and that is the amount of flat spot allowed by railroads before the truck is removed from service, theoretically; as a matter of fact, flat

1668 spots very frequently occur that are much longer than that before the truck is removed from service, but that is the specification, and this chart shows that under certain cases the impact due from a flat spot two and a half inches long may increase the blow to the track or the pressure on the track seventy-five per cent of the normal. I made a similar test in connection with the work that I spoke of a while ago, and found a 50% increase, which is in accord with this.

Chart P shows a series of observations made by Mr. West, a foun-

dry expert, and reported in the American Society of Testing Materials on the rotundity or the evenness of cast freight car wheels; the deviation from a perfectly round wheel is exaggerated in the chart, but the figures are exact, so that they represent the exact amount. These were of new wheels, twelve of them taken at random, representing the product of several different manufacturers; no one of these was perfect; and the author of that investigation concluded that very few cast iron freight car wheels are perfectly round. It will be observed that as high as four hundredths of an inch in radius, and in one case as high as seven hundredths of an inch in diameter was observed as a maximum variation from a perfectly round wheel in a new cast iron wheel, and in that connection it might be worth while to mention that steel wheels such as are used under passenger trains commonly have a maximum variation of two thousandths of an inch, or about one twentieth of that amount.

Chart Q illustrates the effect of wear on the drivers of freight and passenger locomotives under various lengths of service. It is a well known fact that freight locomotive drivers wear rough much more readily than do passenger locomotive drivers, because of the more slippage; they pull a larger per cent of their capacity consequently the wheels slip more and the wheels wear rough.

In the sixth chart or diagram on this chart is shown the 1669 record of a passenger locomotive that had been run sixty thousand miles. I might say in explanation of this that the straight line represents a developed circle and the wavy line represents the contour of the locomotive driver referred to that perfect circle, or, in other words, the deviation from perfect rotundity, and this chart shows that a passenger locomotive, even at 60,000 miles total run, may be almost perfectly smooth. The one shown in diagram No. 1 is not perfectly smooth, but none of the passenger locomotives, even though the run exceeded that of the freight locomotives, was as rough and uneven as the freight locomotives. Those are all of the charts.

I have, this fall, about two months ago, measured some of these wheels on freight cars, myself. I used a templet turned in the lathe to the theoretical surface of a freight car wheel, and applied that templet to a large number of freight car wheels that were standing on yard tracks at Lawrence. That was not for the purpose of this case. I found that at the present time a very large percentage of the wheels of freight cars are rough, the largest percentage of rough wheels occurring under coal and gondola cars.

Under grain cars I found that 7% of the wheels were flat, the length of the flat spot being one to three inches; under stock cars 16 percent of the wheels showed flat spots, varying in length from one to two and a half inches; under coal and gondola cars 20% of the wheels showed flat spots, varying in length one to three inches. I made a study of the wheels under ten passenger coaches and none of them showed any flat spots at all There was absolutely no comparison between the condition of the wheels on the passenger coaches and the wheels on the freight cars.

In brief, the spring system of a freight car is more inelastic, under heavy load is almost entirely compressed, so that there is very
1670 little additional spring available, while under a passenger coach, where the load is not very great, that is, the live load being a small percentage of the total gross load, the springs are always in a condition to be compressed further, so that the shock absorbing capacity of freight cars, particularly when they are loaded, is very small, while the shock absorbing capacity of springs under a passenger car is always large, that is, they will readily absorb a shock, and not strike a blow to the rail.

A six wheel truck always has at least two of the three wheels resting on the same elevation, that is, one of three wheels may drop into a depression in the track, say at a low joint, and the other two of the three will support the truck. In the two wheel truck, that is not the case. When one of the two wheels drops into a depression in the track, it allows the entire car body to drop, but that is not the case with a passenger coach; the car body would not drop, would not be lowered at all when one wheel would drop into a slight depression in the track, because the other two wheels of the truck, of the set of three, would support the car body.

The effect of this continual hammering which I have spoken of caused by freight traffic is most apparent at the joints, in hammering down the joints and causing low joints. It is also manifest in pulverized ballast and in causing the roadbed to be worked up into the ballast, causing the ballast to require cleaning or renewal. It also pounds the ties to pieces, brooms the ties, as it is called. The ties are compressed and gradually mashed and destroyed under the rail, due to the continual pounding of the passage of wheels.

The rail itself is also injured. Most rail failures I might say result from imperfections, that is, they occur at imperfections in the rail, and flat spots of freight car wheels cause the failure to
1671 occur whenever one of these flat spots happens to strike an imperfection in the rail. If the rail were perfectly sound, most all traffic would be carried over without breaking the rail, but most all rail failures result from the fact that these flat spots and irregularities of the wheel seek out, you might say, the imperfections or defects in the rail, causing the rail to fail—to be broken.

These studies seem to show that the damage done to track by the passage of train is primarily due to the weight and in proportion to the weight of the traffic passing along the track and that the speed of the traffic is not an important factor, that the damage is not appreciably increased due to the speed of the traffic. In continuation of that answer I will say that we observed that the stress was in proportion to the weight, whether the traffic was locomotive or a car, that is, it was in proportion to the weight, one ton of weight of locomotive caused essentially the same stress and damage that one ton of car did, leaving out the effect of impact, which is slight.

So far as the operation of passenger trains is concerned, the chief object in superior maintenance is promotion of safety of operation, because a passenger locomotive is not taxed to its utmost to pull its

train. It could always pull a heavier train than it does pull at a lower speed, if necessary.

The object of superior maintenance, so far as freight operation is concerned, is to decrease the tractive effort, or to decrease the tractive resistance and thereby allow the locomotive to pull a heavier train load. The upkeep of tracks that are used in common between passenger and freight traffic is dependent more or at least as much on the desire to decrease train resistance as it is upon the desire to promote safety of passenger train operation.

1672 Suppose you have a freight train and the wheels are flat, or flattened; every time that wheel revolves, when the flattened part of the wheel comes in contact with the track, there is a blow delivered to the rail. That blow is not greater at a higher speed. The blow diminishes at the higher speeds, at speeds above 23 or 24 miles an hour, because the wheel turns so quickly that the car does not have time to drop down and strike the blow. That that is a fact, is a matter of common observation, and has been well established by laboratory experiments made at Purdue University.

"The Court: Suppose you enlarge the wheel to two or three times its diameter and then increase the speed, would you get a greater blow?

A. Yes, with the increased speed you would get a greater blow if the car body has time to make the drop.

The Court: The drive wheel of the locomotive has its counter-balance; isn't there a blow every time that part of the locomotive strikes the track?

A. There is some blow.

The Court: The locomotive wheel, and the size of the driver on the locomotive is, particularly on a passenger engine, oftimes three times what the size of a freight car wheel would be, isn't it?

A. About two and a third times. The diameter of a freight car wheel is standard 30 inches and passenger locomotive usually about 70, varying a few inches from that.

The Court: Take the same weight of locomotives, wouldn't there be a difference between 15 miles an hour and 60 miles an hour in the impact of the driver?

A. With the same locomotive, yes sir.

1673 The Court: Well, it appears in this case by the proofs so far that some of the heaviest engines on the road are passenger engines. Wouldn't that make a difference?

A. The passenger engines, your Honor, are adjusted. The counter-balance is adjusted for operation at the higher speed. There are two factors entering into the counter-balancing of locomotives; one part of the counter-balance, that is the added weight on the wheel, is to overcome the effect of the crank pin; that is, where the connecting rod is attached to the driver, to balance that. That part could be balanced exactly.

The Court: That would be like on a stationary engine?

A. It may be.

The Court: You use a balance wheel to overcome the inertia on the strain?

A. Yes, that is essentially so.

The Court: On a single cylinder engine there would be a dead center that you have got to go by each time?"

On a stationary engine, there is a shake back and forth of the engine, and traction and steam engines show that the engine jars back and forth. That jar back and forth is due to the movement of the reciprocating parts of the engine; that is, the piston head and the part where it is connected to it; they shake back and forth, because every time the piston goes forward it has to stop, and that causes the engine to lunge forward. Now, this second part of the counter-balance of the locomotive is designed to prevent just that thing in the locomotive, to prevent that shaking back and forth due to the reciprocating parts, and the adjustment of that is dependent upon the speed. Locomotives have their counter-balance adjusted to a particular speed. Freight locomotives have it adjusted for low
1674 speed; that is, speeds at which freight trains are supposed to operate, and passenger locomotives have the counter-balance adjusted for higher speeds; that is, speeds at which passenger trains are supposed to operate, and until the speed is exceeded for which the counter-balance is adjusted, there isn't a very great effect on the impact. Obviously, if a freight train is operated at high speed, inasmuch as it is adjusted to be operated at low speed, there would be a high impact; that is illustrated by all of the observations that have been made on the subject. It is true, theoretically, and it is true from experimental results, and those charts which I have submitted here, show that if your passenger train exceeds the speed for which the locomotive was adjusted, with respect to the counter-balance, there isn't a large impact. In fact, the chart shows that the impact under a freight locomotive at 20 miles an hour was the same as the impact under a passenger locomotive at 58 miles an hour, due to the fact that they were counter-balanced for different operating conditions.

"The Court: Is it wholly due to that, or is it due to the fact that freight locomotive was drawing the heavier load and running at the lower speed, which offsets the higher speed and the lighter load of the passenger locomotive?

A. This result, I believe, was obtained by a test taken where the train was essentially the same, a train especially made up for that purpose, the only varying factor being the locomotive. A train of the same weight was taken. Those were tests made by the Committee of the American Railway Engineering Association. The engine was the only factor that was charged. There is a slight wave of the track preceding the locomotive. We have found that to be the case. It isn't always noticeable, I might say, and I can't
1675 say under what conditions it is and under what conditions it is not, that is, what explains it, but it is noticeable in some cases and in other cases we do not notice it. A wave doesn't cause a high stress in the track, but there is a slight wave in some cases.

The Court: Would there be any difference in the lateral strain upon the track, say, upon a curve due to the higher speed?

A. We made at the University of Kansas some tests along that line, and we did not find any marked increase due to the speed, although our tests were rather inadequate; and it is a fact, been found, I believe, by some observers that there is a slight increase on curves due to speed, but not on straight track. Our observations, I might say, were made on straight track for the most part, although we attempted to find the result on curve, but not very successfully.

I would make one statement, your Honor, in connection with this effect of speed. It is a matter of common knowledge, scientific knowledge, that a slowly applied load causes a greater stress than a rapidly applied load. That is a statement, and experiments can be found in almost any test book on mechanics to substantiate that.

The Court: If the rapidly applied stress or suddenly applied stress is compared to the slowly applied stress, wouldn't there be greater liability to breakage?

A. For the same amount of load, it is not so. I can illustrate it in a rather crude but anomalous way: A phenomen*um* one observes, if he touches a hot iron with his finger; if he holds it there a long time,
he will be burned; if he touches it and removes it quickly, he
1676 will not be burned; that is an analogy, although it isn't an
exact parallel, but the same phenomen*um* occurs. It takes a certain interval of time, and if the load is applied only a fraction of the time required for the transmission of the stress, the whole stress will not occur.

The Court: In other words, if you had a screw pressure brought to bear upon, we will say, a steel rail, the rail would not break or bend any quicker or any slower with that kind of pressure, *that* it would if the same pressure was exerted by dropping a weight upon it?

A. The dropping of a weight, Your Honor, is not quite analogous, because we are likely to confuse the effect of the drop with the actual pressure blow, with the actual load applied.

The Court: No, I mean the combination of the force and the weight produces the same pressure upon a rail?

A. The quicker blow will cause the less deformation. I will just give a laboratory experiment along that line, and I think it will make it clear.

In this laboratory experiment, a wrought iron bar was put under a load of 1,600 pounds, and it gave a deflection of .480 of an inch; that is a little less than half an inch, when it was applied one minute; and when it was applied three minutes the deformation was .632 of an inch, an increase of 29% in the deformation with the same load for three minutes instead of one minute, and in another case a bronze bar gave an increase of 13½% when the load was applied five minutes instead of one minute. In the case of zinc, the tensile strength more than doubled by increasing the speed, and Fisher proves similar results for tin.

1677 The Court: I suppose that is somewhat upon the same principle that if you skate rapidly enough over thin ice you can go over without breaking?

A. It is the same principle exactly. It is a matter of common knowledge in mechanics, and I have references here to a number of text books, if it is required to give them.

Cross-examination.

By Mr. Tracy:

I am 35 years old, graduated from the University of Illinois in 1907, and had railroad experience both before and since. My experience consisted generally of maintenance, construction, designing, and work on location. The work on maintenance and location was on the Scranton Division of the Lackawanna, in 1905, 1906 and then in 1907.

I started my experiments in the fall of 1913, and have been working on some of them all the time, until this fall. My preliminary investigations were published in the Railway Age Gazette in July, 1915. I testified in the Missouri Pacific Rate Case, at Omaha, Nebraska, in October, 1917, on behalf of the state. Defts.' Ex. 320 represents my own experience and data taken from charts of experiments by others. The data on page K is from the same source as on L—from volume 12 of the American Railway Engineering Association proceedings, in 1912. By "deflection of rail" I mean pounding down on the rail. The deflection I measured was the temporary pounding down of the rail from its normal position. By the expression, "stresses," I mean the result of an action inside the material, which is the result of a load, this action tending to rupture the material.

Stress results from, but is not necessarily — proportion to, the deflection, though they are coexistent. I measured the vertical deflection, and the stress spoken of was that resulting from
1678 vertical deflection of the track. I testified only to deflection and stress of the rails, though we attempted observations on the stress of ties as well. While not altogether satisfied with the results for ties, there was nothing that showed anything different than the tests on the rails indicated. We used the same device, in a slightly modified form, for getting the deflection of the tie.

I said 2.5 inches was the limit of flat spot that the Master Car Builders' Association specifies before the car is removed from the service. They run them up to that. As a matter of fact, the effect of flat spot has been definitely proved by laboratory experiments to vary as a third or fourth power of the length of the flat. The experiments are not sufficiently complete to demonstrate fully whether it varies with the fourth power or the third power, but it is somewhere in there. Now, if the effect is the fourth power of the length of the flat, then a flat spot of 2½ inches long, which is the maximum allowed on a freight car wheel, will strike a blow 39 times as great as a one inch flat spot, which is allowed on the passenger car wheel; and if it varies as the third power, or the cube,—the two and one-half flat spot on the freight car wheel will strike a blow 15.6 times as great as the one inch flat spot on the passenger car wheel, operated, I am assuming conditions the same in other respects.

The Master Car Builders' Association limits the flat spots on passenger car wheels to one inch. As a fact, the rigid inspection to which passenger coaches are subjected much more nearly secures that

specification than does the rather lax inspection of the two and a half inch flat spot on some freight car wheels. I found one flat spot in this investigation that was over six inches long, for example, on a coal car, on the Union Pacific Railroad, in a *a* train on the
1679 main line, ready to be moved out of the station. So it is obvious that the flat spots on freight car wheels do exceed the two and one-half inch limit frequently.

The flat spots are more dangerous in cold weather, the commonly-ascribed reason being that the roadbed, being frozen, makes the blow more nearly like the blow of an anvil, on a solid base; there is no compression or resiliency, or give, under the track, and the result is more serious.

A break in a rail from a flat spot comes from what you might call the blow. So far as the rate of application of the load is concerned, the speed of the train is immaterial as to the stress which is caused upon any portion of the track. Experiments have shown that the effect of flat spots diminishes with the increase in speed. I cannot say that to avoid danger from a flat spot they should increase the speed rather than issue a slow order. There may be other causes entering into it, but, so far as the effect of the flat spot is concerned, the effect actually diminishes with the increase in speed. Primarily, though not entirely, the maintenance of track to a certain state of perfection is, as far as the passenger is concerned, for the safety and comfort of the traffic.

Redirect examination.

I think there were two points that came up in connection with my statements this morning that may not have been perfectly clear; one relates to the effect of the counter-balance of the locomotives as compared with the effect of a flat spot on a freight car wheel or any other wheel. They are not similar. The effect of the counter-balance on the locomotive is merely to increase and decrease periodically the pressure on the track; it is not in the nature of a blow; whereas, the effect of a flat spot upon a wheel is a distinct blow as the weight
1680 of the body of the car comes down on to the track.

One other matter I should like to make a little clearer is that the effect of the traffic going over a bridge is very different from the effect of the same traffic over a track that is lying on the ground. Certain of these exhibits refer to tests that were made on bridges, and the tests that I made myself relate to the track itself as it lies on the roadbed, and that matter might not be perfectly clear. A bridge is a whole structure, and each member of the bridge is free to vibrate to a greater or less extent. A bridge is supported at two points, at the ends, and is, in a way, like an immense fiddle-string; it can vibrate. And the members of a bridge are similar, the chords and the diagonals and all the members are not supported at intermediate points, but are supported at the ends, so that they are free to vibrate. Now, as a locomotive passes over a bridge, the effect of the counter-balance on the locomotive will depend very largely upon the vibration of the bridge in time, or in consonance, which is the scientific term—in tune you might say, with the period of rotation of the wheel; that is, if the

bridge, or the mem' er of the bridge, vibrates in time with the rotation of the wheel, the effect is cumulative, and so the stress is much greater than it is if there is no vibration. Now, the large effect of the counter-balance on bridges which has been observed in certain cases, is due to the vibration, and not directly due to the increased pressure of the counter-balance. The counter-balance sets up a vibration in the structure, and the weight of the structure itself vibrating really causes the increased stress, and not the direct pressure caused by the counter-balance. Those were the two points that I think were not quite clear.

1681 EDMUND J. KATES, a witness for defendants, produced before the Court, Nov. 30, 1917.

Direct examination.

By Mr. Groesbeck.

I reside at Lincoln, Nebraska. I am a mechanical engineer, devoting my time exclusively to studies relating to railway equipment and correlated subjects. I was from 1901 to 1909 with the Burlington on its lines west, in Nebraska, starting in the supply department; I was then transferred to the mechanical department and given two years as piece work inspector and foreman in the freight car shops, one year in the main drafting office, on equipment design, two years as shop engineer, in the passenger shop at Plattsmouth, and two years as shop engineer in the locomotive shops at Havelock, with a portion of a year as assistant shop improvement engineer.

From 1909 until 1914, I was in the engineering department of the Nebraska State Railway Commission, first as mechanical engineer and then as principal assistant engineer. During all that time, I had charge of the inspection and appraisal of all the equipment on the steam railways in Nebraska, my chief duties being the collection of data relating to the cost and depreciation of this equipment, and during that time I was also chairman of the Equipment Committee in the Association of Valuation Engineers, among the various commissions of the states, in which capacity I had charge of the collection of equipment cost and life data for the several states west of the Chicago line.

I was on the lines of the plaintiff several days, and inspected quite a considerable portion of the equipment. I inspected some of each of the several types of equipment they have on their line. I made myself familiar with the kind and character of equipment, as to locomotives and passenger and freight cars.

1682 I have a copy of the exhibit of Mr. Fowler (Pltf.'s Ex. 211-214) which contained a list of the equipment as to quantities in the different series and numbers of the series. I am able to estimate the present value of that equipment. The present value that I have attempted to obtain represents the remaining serviceability in the equipment as it exists at the date of the appraisal. I have made an appraisal of the four years, 1914, 1915, 1916 and 1917. As a basis for valuation, I determine first a value new for each item of equipment based on normal price conditions, not on such abnormal con-

ditions as exist today in the equipment market. The basis for my normal price conditions is the actual cost of equipment purchased by the railroads of the United States during the period from 1911 until 1913 and 1914, just prior to the influence of the war situation.

The data from which I take my price units is the actual costs to the railroads operating west of Chicago of the equipment they have purchased in recent years. I have had access during my work in various states, and in connection with my work on this committee of the Association of Valuation Engineers, to the actual costs of practically all of the equipment purchased on practically all of the railroads west of Chicago. That gave me an immense fund of information, from which it was possible to derive averages representing the actual cost to the carriers of their equipment. That gave me a set of units under normal conditions, which I apply to the different types of equipment on the South Shore at the date of the several appraisals, and arrive at a value new, based on the fair, normal cost of new equipment. From that I deduct a percentage representing the used or realized service, and measure the remaining value, the depreciated value, of the equipment on the same basis that a life insurance company uses in setting up a mortality table on human life.

1683 By the normal, I mean the average. I might also say in that connection that I have tested that average with the average for a five year period prior to 1911 and a ten year period to 1911, finding a striking similarity, or agreement, so I consider that the basis upon which I arrived at the new value of these various pieces of equipment is truly a normal price under normal market conditions.

I would hesitate to set up any definite factor of difference between 1916 and before, but in 1915 there was a slight slump in the prices; i.e., the average prices in 1915 would probably be somewhat lower than the average for the period immediately preceding it. In 1916, the war influence was felt, and there was a slight rise or recovery of the prices, though not nearly so much as has been felt in the past year.

My own investigations of the actual history of equipment on the railroads west of Chicago has shown me that the locomotives in service have actually given their owners an average service of 26 years. That is made from a study of a large number of pieces of equipment; for instance, it represents a study on the retirement of *1991* locomotives; the actual service of these two thousand locomotives averages 26 years, and I feel that that establishes a normal period of service which we can safely use in predicating the probable remaining service in equipment today, so far as it relates to that particular class.

As mechanical engineer for the Nebraska Commission, I had access to the records of all the railroads entering the state of Nebraska. As chairman of the Equipment Valuation Committee in the Association of Valuation Engineers, I had charge of the collection of like data for that Association, and in that connection was able to have the valuation engineers of the other states collect the data along the lines that I outlined, so that all of the states col-

1683*a* laborated and furnished me, or rather collected under my direction, the data from the railroads in their jurisdiction. Then, too, since leaving the Nebraska Commission, I have handled cases on several of the southern roads, including the Frisco, the Katie and the Santa Fe, so that I have been able to extend my personal investigations to the equipment on these roads.

My method was exactly analogous to that by which the life insurance companies estimate the probable remaining life of a human being. I set up, first, the curve representing the per cent of equipment remaining in service at the end of each year from the date it was new; that gives me a table of expectancy on the performance of equipment. The average of that curve at the time the equipment is new gives me the average life of equipment. In other words, a freight car can be expected to have 20 years' service at the time it is new. However, if that car lives to be 20 years, it still has some remaining service.

My curves enable me to set up for any period or any age of that car the expectancy of remaining service. Taking the freight car, for instance, as an example, when it is new, it has an expectancy of 20 years, as I stated; when it is ten years old, it has an expectancy of 10.6 additional years; when it is 15 years old, it has an expectancy of 6.6 additional years; when it is twenty years old, it has an expectancy of 3.6; when it is 25 years old, it has an expectancy of two additional years. If it lives to be 30, it still has some probable life, or an expectancy of 1.1 years.

Under my theory, so long as there is life there is hope, in that car. I never would come down to the actual vanishing point in the value of that car. Now, that gives me the expectancy, and by adding the expectancy to the realized life I get a measure of the total expected life. Now, as the value of a piece of equipment exists in the possibility of its use, so its value diminishes as its use has occurred.

1683*b* If at the age of 10 years we have 10.6 years' remaining service in that car, the proportion of its value which has been used by the company, or, rather, which remains to the company, is represented by the relation of this probable remaining usefulness in years of service, 10.6 as against the total represented by the sum of its realized life and probable remaining life, or 20.6. In that case, the remaining usefulness would be 51.4%. Now, 51.4% applied to the wearing value of the car, which in a case of freight cars is 75.3%, gives 38.7 as the remaining portion of the wearing value of the car.

In a car there exists two elements, one which is constant, the salvage value, that does not decrease—it is always in the car. When the car is scrapped, it is returned to the owner; therefore, the depreciation can only apply to the other part, or the difference between that and the total; that other part I designate the wearing or depreciating portion of the equipment value.

My Exhibit 321 represents my valuation of the present locomotive equipment of the plaintiff for each year, 1914, 1915, 1916 and 1917. The column, "Total Replacement Cost," represents the cost to replace that locomotive new, using, as I say, the average or normal price existent between the years 1911 and 1914. I might add that that

price is based on a cost per ton of locomotive and tender, using the loaded weight of the locomotive plus the light weight of the tender, and is a study on which I have been working for the past eight years, which sets up the average cost of locomotives per ton for each of the weights from forty tons up. In other words, the schedule in prices decreases per ton as the weight of the locomotive increases, a light locomotive costing more per ton than does a heavy locomotive.

My study of locomotive prices and depreciation is the result of the analysis of the actual costs of practically every locomotive purchased on practically every railroad west of Chicago, going back for a considerable period prior to 1911. I have used prices paid for locomotives in former years, bringing them up to the normal period by means of a scale of fluctuations in prices. The expectancy table for locomotives was derived in exactly the same way as I described in discussing the depreciation of freight equipment.

1383c

There are three distinct factors making for depreciation which of necessity must be considered in my calculations. The first is the liability to accidental destruction which adheres to the piece of equipment the moment it is placed on the rail. The second is the wear and tear and decreptitude, which is gradual and which culminates finally in the total destruction of the piece of apparatus. The third is the inadequacy or obsolescence which comes to the equipment just as surely as the years go by; no matter how well designed a piece of equipment may be when it is new, the advancement in the art of railroading will bring about a condition finally which has changed the conditions under which that piece of equipment must work and has rendered it obsolete or inadequate to meet the service. The combination of the three make for the total depreciation or elimination of the equipment, and, as my studies are based upon the actual performance of the equipment on these various Western railroads, I have necessarily included in that the liability against these various forms of depreciation.

Exhibit 322 is my valuation of the passenger train cars. The first three columns, as with locomotives, were taken directly from Mr. Fowler's exhibits. The cost to replace is based on my average units of the cost to construct passenger equipment. I paid especial attention to the passenger equipment while I was on the South Shore last week, examining a great number of their coaches and passenger cars,—I am positive over half of them,—so that I could gain a very clear idea as to the character of their equipment. Then, by means of my average prices, which have been worked up as with locomotives from the actual cost to the various companies in the United States, I was able to establish the cost new or cost to reconstruct the equipment in kind, using the normal price—not the price existent at the present time. That, then, was depreciated, as with locomotives and in exactly the same way, to get the present value, or, I prefer to term it, the present fair value, of the passenger equipment in each of the years, 1914, 1915, 1916 and 1917.

1683d

Defts.' Ex. 321*a* represents a valuation of the locomotives on South Shore which have been retired since April, 1914, or, rather, since September, 1913. The locomotives, then, that were in service at the

date of the several appraisals are included in this statement, which should be added to the statement shown in Defts.' Ex. 321.

Defts.' Ex. 324 shows, first, the locomotive price units I have used in the appraisal of the South Shore locomotives. The tabulated statement gives, first, the weight of the engine in tons, and in the corresponding column the price per ton. That weight of locomotive is the weight of the engine in running order, plus the weight of the tender light—that is, without coal or water in the tender. Below is a statement reading that the above prices include the costs of locomotives on the rails of the owner, except the freight from the factory; that is, these prices included all of the setting up and breaking in and messenger service charges, so that the only extra to be added is the freight from the factory, which in this case I have estimated at $6 per ton, that being approximately the cost to get locomotives from Philadelphia to an equal distance in the west. Not having definite data as to the exact freight rates to the South Shore points, I used that factor. The lower half of the sheet shows the price units used in establishing the new value of the passenger cars on South Shore. The statement on the left hand side of the sheet gives a value for the bare car body of the different lengths and different types. 1683*c* This price is sufficient to cover the cost of the body without the trimmings or trucks. On the right hand side of the sheet are the detailed prices for the trucks and fittings. From this schedule it is possible to take a description of a car and set up a table which will represent the normal price of building that particular car. These units are abstracted from the book of units which I have compiled from a study of the actual costs of equipment on the western roads, and represents a fair average normal price existent prior to the European war. The passenger coach price, or the passenger car prices, I might say, cover transportation to a point within a radius of approximately five hundred miles from Chicago, so that in this case it was unnecessary to add to the passenger car units a freight charge to get the equipment upon the rails of the South Shore.

My value on plaintiff's equipment is as described and set forth in Defts.' Exhibits 321 and 321*a*, Locomotives, 322, Passenger Cars, and 323, Freight Cars, for the years 1914-1917. Defts.' Ex. 324 shows the locomotive unit prices used.

KATES.

Cross-examination.

By Mr. Tracy:

I spent three days on South Shore, inspecting all the equipment I could find around Marquette, Ishpeming and Negaunee, the inspection of locomotives being to determine if the South Shore equipment was peculiar in any way to distinguish it from that of other railways of the country. I did not visit the shops and study the shop records as to repairs, or investigate the maintenance. I found nothing peculiar about the equipment.

In reaching my unit prices, I based them on the average of the

prices paid for similar equipment used on the western railroads in the period of time from 1911 to 1914. In arriving at my per-
1683*f* centage of condition, I based that upon the average life of all locomotives and passenger and freight cars of similar classes on the western railroads. I feel confident that my studies give a ratio which is truly reflective of the conditions today, with our present equipment. The percentage I applied was the percentage condition of the average of all the equipment of the same age on the western railroads—those west of Chicago.

I was on the South Shore three days of last week, going from Mackinaw to Marquette, spending considerable time around Marquette, going up to Negaunee and Ishpeming, and inspecting all the equipment I could locate in those two yards, and then spending another day in the yards at Marquette, inspecting every train as it came through relative to the passenger equipment and all of the freight equipment and locomotives that were in the yards at that time.

My inspection of the locomotives was made in the yard simply to determine if the equipment on the South Shore was peculiar in any way from that existent on other railroads of the country. It was an investigation as to type. I did not visit the shops or study the shop repair records, or investigate conditions regarding maintenance of equipment, or the character of water used in the locomotive boilers, and things of that kind. I proceeded on the assumption that, regardless of obsolescence, an engine is bound to wear out, and has an absolute life, regardless of maintenance, my table being computed upon a life of 26 years for locomotives, 33 for passenger train cars, and 20 for freight train cars.

KATES.

Redirect examination.

By Mr. Groesbeck:

On my visit to the South Shore, I found nothing peculiar or unusual about the condition of the South Shore equipment—nothing but what I would expect to find on any other road under similar circumstances. I valued the locomotives purchased in 1913 at the original cost to the company.

1638*g* KATES recalled by defendants December 4, 1917.

Direct examination.

By Mr. Groesbeck:

Defts.' Ex. 327 shows the mortality, depreciation and expectancy curves used by me in my valuation. On the first sheet of this exhibit I have given a brief summary of the processes by which the final ratios were computed. The mortality curve, as shown on the three classes, as I stated in my direct testimony, is history, being

taken from the actual performance of equipment on the western roads. The expectancy curve and the depreciation curve are mathematical deductions made from the mortality curve. The ratios expressed by the depreciation curve were carried forward on to the first sheet, to get them into statistical form, and it will be noted that the ratios shown on sheet 1 of this exhibit (327) are the ratios which I have applied against the cost new prices on the equipment in the appraisal which I have entered for the South Shore equipment.

I testified that the average life of a locomotive was 26 years, but that actual average life really does not enter the computation. The mortality curve and expectancy curve refer to life of remaining service, while the depreciation curve carries that into a value reference; therefore, the mortality curve and the expectancy curve will go from 100% down to nothing, while the depreciation curve will go from 100% not lower than the constant salvage value, or, in this case, 10%.

Take an engine 20 years old; the mortality curve shows expectancy of 9.1 years. We can expect that engine to remain in service 9.1 years more. On the mortality curve, if we add together the per cent for all the remaining or succeeding years and divide that by the height of the abscissa at the year representing the age of the locomotive in question, that will give an average for the additional life. In other words, that is by a mathematical calculation the exact expectancy for an engine 20 years old, as calculated or as shown by the performance of engine in actual service. If we start at the left hand side, the date the engine is new, and plat the percentage for each of the years from nothing down to 50, and divide that by 100, we will get 26 years, which I stated in my direct testimony is the average life for all conditions. That, however, is the only place in which the average life enters this calculation.

1683*h*

The actual cost of each of the locomotives purchased in 1913 by the D. S. S. & A., of the 700 class, was $18,264.50, including superheaters. The unit cost of those locomotives in 1913, according to my estimate, was $15,743. The cause of the apparent discrepancy is that these engines had superheaters. The average on which my basic unit prices are based includes engines which have superheaters and some which do not have superheaters, so that, applied to a group of engines, as is usually found on a railroad, some with superheaters and some without, the average works out. That is illustrated by the memo. I have added to the lower part of that sheet, wherein I have shown a record of the purchase of 316 locomotives during the year 1913, on which the actual cost to the railroad was $8,883,783. Applying to the weights of these 316 locomotives my average unit, I would get a value of $6,968,672, or just slightly in excess of the actual cost. In other words, almost an exact agreement with the unit cost. Now, the units, if applied to a single group of engines which had some extraordinary feature, such as superheaters, would, therefore, be slightly under, and there is no disagreement, then, in this apparent discrepancy with the actual cost. However, if the

unit be applied to engines, none of which have superheaters, then they are in excess, and that is actually what has happened in my appraisal on the South Shore, because I find that none of the other engines on which I based these units actually had superheaters. To that extent, I have given them credit, then, for something which they do not have.

1683*i* KATES.

Cross-examination.

By Mr. Tracy:

Q. I understand that you say the difference is due to the fact of the superheater?

A. No, I didn't mean exactly that. That is one of the things that would make a difference. There might be other things. You might have purchased these particular locomotives under adverse condition. In other words, I was trying to set up that comparison of units. That one actual purchase would be meaningless.

1684 EDGAR FRENCH, a witness for defendants, produced before the Court, Nov. —, 1917.

Direct examination.

By Mr. Groesbeck:

I am a civil engineer. I began railroad work in 1879, and have spent practically all my life in that kind of work. I was with the Grand Trunk Railroad for 22 years, as resident engineer and assistant engineer.

When I left the Grand Trunk, in 1901, I went into industrial engineering with Joseph H. Berry, of Berry Brothers, at Detroit. I had charge of all his real estate improvements and building operations in different parts of the country. I rebuilt in 1903, the Newberry Furnace, on this line; built a varnish factory for him at Walkerville; rebuilt the Manufacturers' Railroad in Detroit; was on the Saginaw & Flint Railroad, in charge of a part of that work; in charge of the building of an interurban line from Bay City to Saginaw, which is work very similar to much of this; rebuilt the Toledo & Detroit, from Toledo to Dundee.

I was in Mr. Barry's employ until 1907. My work with the Grand Trunk was maintenance of way and engineering. I had charge of the construction of all of the work the Grand Trunk did west of the Detroit and St. Clair Rivers, while I was with them, to the time they started double-tracking.

I had charge of building their line from Elsdon across to 49th St. in Chicago, to connect with the Western Indiana; I was on the construction of their line Valparaiso to Chicago, in 1879 and 1880.

I have never had charge of a piece of railroad construction work entering into a new country. I have never had to build where I had any great difficulty, in the transportation end of it. I have never

1685 really had to face the problem of whether in building 400 miles of new line I would have to ballast it as I went along, or ballast it afterwards.

I have recently been working on the South Shore, for the purpose of obtaining data concerning conditions and costs pertaining to that company's property. I began in the latter part of June; I left in August, 1917, on account of illness; and was again there in October, two weeks.

I walked all over the Mackinaw Division, except the branches; the main line from Soo to Marquette, and St. Ignace to Soo Jct.; also went over the Houghton Division, from Marquette to Houghton, and from Marquette to Winthrop Jct. over the south line. That is the old Marquette & Western. I did not walk from Nestoria to the Wisconsin state line. I have been over it a number of times on passenger trains.

I made an estimate of what it would cost under normal conditions in 1914, 1915 or 1916, to do the necessary grading on the various divisions of plaintiff's line. Taking into account the modern methods of moving earth, I figured that the earth could have been moved for 25 cents a yard straight through. I wouldn't change plaintiff's figures on solid or loose rock. The material would be principally sand, though part of it would be muck and clay. In doing the work through swamps with ditching machines, which would be the proper way, you would have no use for corduroy.

1686 HENRY C. ADAMS, a witness for defendants, recalled before the Court, Dec. 4, 1917.

Direct examination.

By Mr. Carr:

I am at the head of the Department of Political Economy, Business Administration and Sociology, at the University of Michigan. I have made a special study of the science of railroad economics and the principles of railroad accounting. I have also made a special study of the permanency of prices due to a condition of war; I have been obliged to study that whole question of war financeering. I have written a treatise on that subject.

My judgment as to whether the high present prices are likely to be permanent is that the prices at present are quite abnormal, and, judging by what has happened in other cases in the past, it is not likely that those prices will be maintained after peace has returned. That applies, in my judgment, to the prices of material and of labor used in railroad construction and operation. My answer is based upon the study and investigation I have made of the matter. I might perhaps add that in the study of war financeering it becomes necessary to trace both the effect of the financial administration of the war upon the prices during the war to find out when that upward tendency stops after the return of peace, and when the period of fall comes. I think it is correct to say that in all cases the movement of prices will follow that general order.

I know nothing in the present situation that would warrant the expectation that the high war prices of the present time will continue after normal commercial and industrial conditions return.

In my judgment, it is unfair to the public to include a valuation based upon the movement in prices. This rests upon two thoughts: one is that it departs from the basis of investment; the other is that under the established rules of accounting the maintenance of
1687 the property brings those increased prices as a burden to operating expenses. That is true, because when a unit of property goes out of service, there is charged to operating expenses the cost of replacing that property at the existing price, so that these increasing prices are taken care of from time to time by concurrent charges to operating expenses. I cannot think it quite fair that these prices should increase the charges that the public must pay for railway service, and at the same time that the railway should include the result of these increasing prices in valuation among its assets. It seems to me that it is counting the same thing twice, which of course would be improper. That is, the public pays it in the form of a charge at the time the particular units of property are replaced, so that if it is necessary to replace, in order to replace in kind a certain unit of property, to charge to operating expenses more than the original cost of that property, operating expenses are called upon to bear the difference.

In my judgment, if the appreciation of any kind which is not offset by a sale of securities, which means a real investment, is included in the valuation of property for testing rates, that is equivalent to a capital profit; that is, equivalent to the actual increase of the assets of the company, and that therefore in testing a rate there should be added to the operating profit which comes from operation this capital profit in order to get the true profit that the company has been benefited. For the purpose of testing a rate when the appreciation is included in the figure used, I would regard the total profit or income as made up of operating profit and of capital profit. On that theory, it is my judgment that appreciation in prices should be regarded as capital profit and added to income if the value of property is taken.

1688 The Court: Suppose there were involved in this suit solely the question as to the adequacy of the return in 1917; what values of property would you take to base that return upon, upon which a return should be given?

A. I should seek for a value which fairly represents the investment of the people who put the money into the business. I do not think I could find a value for testing a rate on this theory of confiscation if I were confined to the particular year when the case arises.

The Court: The peculiarity about this situation, that a rate statute may be constitutional at one time and unconstitutional at another with reference to the same railroad. Taking that into consideration, if we were solely ascertaining whether the statute were confiscatory at the present time, what values of the property would you take?

A. I would take the value which in my judgment represented the investment of the people, of those who put their money into the property.

The Court: Well, let us go a step farther: suppose it were assumed by both parties that the measure of the value is the cost of reproduction new, less depreciation.

A. It is difficult for me to discuss things of that kind because I am not altogether sympathetic with the theory of the costs of reproduction. I think there are a great many mistakes in it and you have assumed that that is correct; but even in that case I should exclude from that value appreciation which did not represent any investment whatever of those who put their money into the property in so far as I could discover in 1917 what that appreciation was.

1689 The Court: Would you do that regardless of what you term war conditions? For instance, to make my meaning plain, we have periods of depression, business and financial, commercial depression, when prices are abnormally low. It has been the history, I think that when the recovery begins it increases for a period of years, for a cycle of years. Now during the period of constantly increasing prices would you take as the basis of value of the property preceding the period, during the period or what might in view of experience be called probable future, or probable future increase?

A. I doubt if it is possible in a case of this kind, seeking after equity, to do equity to either party, if you take your valuation on a particular year. In all the cases that I have been connected with I have insisted at least in taking ten years, and my reason for taking at least ten years is that ten years is the usual period of industrial cycle, so that in those ten years you have had the bad, the good and the excessive; and I feel that in matters of this kind it is not possible to tie one's self down to a particular year, but that we must take the general trend, the average of a period and project that possibly on the experience of the past into the future. It was that feeling that made me hesitate about 1917.

The Court: Of course the larger element which constitutes a price is the labor element. It is true, is it not, that since the panic of 1893, with an occasional year of either stagnation or perhaps a slight decrease, the value of the labor element has constantly increased.

A. That is true in the past few years. It was not true after the war of 1860, that the high prices of labor did not fall. I suppose that at present the explanation of the more or less per-

1690 manency of labor prices is the organization of the men which is entirely a non-commercial fact, and whether or not that is likely to continue after this excessive demand for labor due to the requirement of the transition from the condition of peace to the condition of war and industry, is a very difficult question to answer. I will be perfectly willing to express my opinion on that or anything else, if it is desirable, but it gets into a pretty big subject, of whether or not the trades unions have gotten up as high as they are going to get; that is a pretty big question. There is no question but what at present a large element of the increase of these prices is due to

labor, but it is by no means all. It is due also in large measure to the peculiar war conditions of this country for the two years before they entered the war. It is tied up with the general fact that the financial center of the world is temporarily, at least, transferred from London to New York. It is tied up with the fact of the enormous demand for munitions on the part of European countries which are allied to this country, and which also we had to sell the bonds to pay for. While I recognize that the labor element is very important, I should not like to be understood as conceding that it is the only element in the explanation of the inflation which we now suffer.

Q. You think that is true Professor, that a period of high labor costs is followed by excessive development in labor saving machinery? Has that been a matter of history?

A. That was the result in 1860. Most of the agricultural inventions date from about 1862, and very high in 1863.

Q. Now, will you tell us from the study that you have made of railroad operation, as to the probable effect in your judgment, under ordinary conditions, of a reduction in rate upon the volume of traffic which may be expected.

1691 A. Answering that in a general proposition, it is true that the reduction in any price or any rate tends to increase the volume of sales, in this case, the volume of traffic.

I think my personal investigation on that subject is limited to what is known as the Michigan Central Charter Case, when the Michigan Central sued the State for damages on account of the repeal of its old charter, the result of which was to bring that property from a three cent basis to a two cent basis. In that case the change in the basal rate was followed by a considerable stimulation of traffic. I want, in fairness to the situation, however, to add that there was in connection with that situation the educational influence of the electric lines that are paralleling the Michigan Central, the education of the public to riding and using trains, so that in honesty I should hardly like to go on record as saying that all of the increased passenger traffic, following the repeal of the charter, was due to the change in the price. The reduction of the rate and the education of the public came at the same time, and the education of the public came through actual travel, under reduced rates.

I have made some study and investigation with reference to the historical reasons for the construction of that part of the South Shore system which runs west of Nestoria. I have drawn my historical information on that subject from the Railway Age, the Railway Gazette, the Railway Review, the Commercial Financial Chronicle, the Engineer News, Poor's Manual, the Michigan Railway Reports, some of the New York papers, and the Marquette Mining Journal. I have referred to publications put out at that time, or immediately preceding or immediately following the construction of that line. I went through these publications during the period that would be affected by this case. I took off over four hundred references.

1692 Mr. Eldredge: If I understand, all of this is a part of the Record already. I haven't the slightest objection to it, being

called to your Honor's attention, but it doesn't seem to me that it ought to be necessary to cumber this record with it the second time.

Mr. Carr: Now if the Court please, I don't understand that there is any of this material actually in the record; that the parties have proceeded on the assumption that the Court might take judicial notice of all of this because it is of a historical nature, and as counsel suggests, the purpose is merely to call the attention of the Court to it.

Mr. Wykes: It was in the record for use in brief. I don't know whether it was formally introduced, but it was produced as historical data, and I take it any means for bringing historical data to the attention of the Court is proper.

Mr. Eldredge: I doubt whether this is historical data or not. I haven't the slightest objection to it upon any other ground than that we ought not to put it in the record twice.

The Railroad Gazette of March 13, 1885, quotes the following from the Marquette Mining Journal relative to the purchase of the M. H. & O. and that part of the M. W. Railroad: "We have reason to believe that this sale is part of a general agreement, by the terms of which the M. H. & O. is to at once complete to a point of junction with the Milwaukee, Lake Shore and Western and the D. & M. is to build through to Sault Ste. Marie. The Canadian Pacific is now within sixty miles of the Soo, we understand, and will put its line to that point without delay, when sure that the connecting line is progressing to meet it. The completion of all these lines as indicated will give us the through route between the seaport so essential to the rapid development of this region and for which our people
1693 have waited so long and patiently."

The Court: If this were a jury trial, I am quite certain that the Court would have to rule out any testimony of this kind, I am quite certain it wouldn't be competent evidence.

Q. Based upon this investigation you have made, Professor Adams, will you give us your views of the reasons for the construction of this line west of Nestoria?

A. The line west of Nestoria as shown by the citation which I have before me was built for the purpose of connecting up a through system. It was not built for the local traffic. It was built to make a link between the Eastern Portion and certain railroads centering or terminating in Duluth and Minneapolis; and my interpretation of these readings is that it would not have been built had it not been for the desire to make a through east and west system.

Q. Professor Adams, are these citations to which you have referred and the data that has been available to you in your investigations, in your opinion, sufficient to establish this, as a historical question?

A. Unquestionably.

1694 C. W. HILLMAN, a witness for Defendants, produced before the Court, Dec. 5, 1917.

Direct examination.

By Mr. Groesbeck:

My place of business is at Louisville, Ky. My present residence is Utica, New York. I am a public accountant, specializing in railway accounting and investigations, having been in that work for eleven years.

I have been in a large number of cases of rate litigation, starting with Kentucky on the two cent rate under the McCord Act; following with North Carolina, on its two cent passenger rate case; special investigations for Florida, of railway matters for their Railroad Commission, three cent passenger rate there—a reduction from four to three; freight rate and express rates several times; Alabama on the two cent passenger rate case, combined with a change in commodity rates. I was with them twice. Returned to North Carolina on freight rate matter; for West Virginia in their passenger rate cases, Norfolk and Western and also Chesapeake and Ohio; on freight rates for the coal shippers out of West Virginia; Indiana on its express rates; Illinois on passenger rates and coal rates; North Dakota on coal rates; South Dakota on grain rates and two cent passenger rate case; Ohio coal rate cases; Michigan, two cent passenger Ann Arbor Rate Case. There have been a number of others where I have been in consultation and given testimony.

I commenced work in this case March 17, 1917. I had from three to five assistants, and Mr. Parker had two. In general, my work was to obtain the data from the books and records of the company or by investigations to determine, first, the amount of the expenses chargeable to Michigan; second, how much of those expenses were chargeable to the passenger business; third, how much of the passenger expenses in Michigan were applicable to the regular passenger
1695 and baggage business, how much to sleepers, to diners, and to mail and express; then to determine how much of the passenger business was due to intrastate and how much to interstate; to assign all additions to and deductions from income to these various classes of expenses; to apportion the property values; to determine the amount of capitalization, the value which was applicable or chargeable to each class of business, and then make the application; how much the return would pay in percentage on the investment.

Defts.' Ex. 329 contains my figures and the results of my work. The item taxes will be revised to accord with the actual payments now set forth and used by Delf, the taxes I have used being taken by me on the accrual basis. They will be divided proportional to the value of the property in each class of business.

The plan of the exhibit (329) is indicated by its index. The factors are first stated, being the ratios of our assignments to Michigan and to services. Then follow the expense accounts by items, with a summary; then an analysis of the revenues and income account.

To illustrate my method: Refer to page 27 of the exhibit No. 1, "Superintendence," Maintenance of Way and Structures, 1914. The road system figure is $23,253.50; assignment to Michigan was made on Factor 1-D, the relation of active accounts in this block of expenses in Michigan to the total; the Michigan percentage, 81.0531, equals $18,830.71, superintendence for Michigan. Factor 1-G (page 3 of the exhibit) shows the proportion chargeable to passenger, or 27.1648 per cent, equaling $5,115.32. To assign this to services, Factor 1-J is used, as this is an overhead account, divisible on the balance of the active accounts in the block of expenses.

1696 Referring to account 2, "Ballast" 1914. The Michigan expense was actually allocated; it was then assigned to passenger on Factor 16-A, page 20 of Defts.' Ex. 329. This factor is used as part of the tracks are exclusively freight, part exclusively passenger, and the remainder common to both, the latter, having been assigned to passenger on the basis of the gross weights using the common track. The derivation of the percentages used in Factor 16 is shown on the factor itself, referring for track percentages to Factor 14 and for gross weight to Factor 13. On Factor 14, page 18 of the exhibit, is shown the common trackage, 456 miles, exclusive freight trackage, 165 miles, and exclusive passenger, 2 miles.

As it costs more per mile to maintain main track than sidetrack, the question became the proportion between the two. We adjusted the mileage by treating the main track as two and the sidetrack as one, on the basis that it costs $2.00 to maintain a main track as against $1.00 for a sidetrack. To be liberal, we used this ratio, though our investigations indicated $1.50 per main track mile to $1.00 per sidetrack mile. In my investigations to determine this ratio, I found the road divided into sections, each in charge of a gang. I assigned the actual expenses of maintenance incurred on each section to the section; I then went over the blueprints of sections and took off the percentage of side and main tracks on each section; I then classified the sections, combining all those having 95 to 100% main track, then those having 90 to 95% main track, then those having 80 to 90% main track, and so on, classifying the sections until I came to the other end, where there was less than 10% main track or the bulk of the work was on sidetracks. This gave a series of equations showing how the expenses would be affected by

1697 the admixture of sidetrack with main track or main track with sidetrack, as my sections were scattered all over the road and represented all conditions of the traffic, because the sections having these percentages were not contiguous; they were scattered. I then equated the track and worked out the percentage which would be indicated by the admixture of the different classes of track. The highest percentage that I could obtain by any combination in the whole series was 172%, indicating that for every dollar expended on sidetrack per mile there would be $1.72 on main track. When we combined the results for the four years, the combination of all our percentages and equations gave us $1.49 per main track mile, against $1.00 per side track mile. These figures are derived from the actual operations of company and their actual book charges.

At Marquette, I examined the red books on which the reports of the section bosses are made to show the amount of material and labor they are using in their track. We used them constantly in the assignment just mentioned of maintenance expenses to different sections. I found them incorrect. I did not feel from my examination from prior records that the men making these reports were competent to put in the statement whether it was a freight expense or a passenger expense. I made one test to determine that, on section 34, in 1917, where the section men's report shows a large expense to passenger direct, as well as to freight, and there is not a mile of passenger track on that section. That confirmed my idea that the men were not competent to differentiate between freight and passenger, and I discarded Delf's location for 1917.

To continue as to Factor 16: 82.9078% of the adjusted trackage was common to freight and passenger. The expense of that common track we have assigned to freight and passenger on the basis of gross weight passing over the common track, as shown on
1698 Factor 13, page 17, or 30.108% passenger.

The reason for using the gross weight is that it is indicative of the wear of the track under traffic; the heavier the weight over your track, the more it is worn, and the more repairs and the better upkeep become necessary. This is distinctly shown by this road, where they were compelled to increase their rail and strengthen their bridges, to accom-odate the heavier weight.

The only matter to be determined is whether a ton of passenger traffic over the track has the same effect on track wear as a ton of freight traffic. The objection mostly made against the gross weight factor is that it takes no account of passenger speed. This claim neglects the reverse of the proposition which is that the freight equipment is not kept in as good condition as the passenger and therefore exerts more wear on track per ton moved than does the passenger. The more I have studied the matter the more I have come to the conclusion that the balance should be against the freight and that the freight tonnage should be weighted when the comparison of gross tons is made, and not the passenger traffic. Items to be considered in weighting the freight tons are, first, the construction of the freight rolling stock, running on insufficient springs, cast wheels instead of steel-tired wheels, trucks not balanced to absorb lateral and vertical pressure, and second, the constant nosing of the freight cars due to inequitable loading and to the exertion of the engine as it pulls from side to side, moving more slowly, jerking the cars backward and forward. This constant snake-like weaving motion can be noticed by sighting down the side of a train moving over the track. In the passenger train, the higher speed prevents to quite a large extent, this weaving motion. The engines are compensated for the load they have to draw and for a
1699 given speed; so long as the speed is retained within the limits of compensation there is no more hammer blow for the passenger than for the freight engine; when that speed in either passenger or freight engine is heavily exceeded, the hammer blow is more manifest than at regularly compensated speed.

In freight traffic, there are a number of flat wheels, which do not exist in passenger traffic. When a passenger car gets a flat wheel, it is repaired. In freight, it is not done with such frequency, and there is more latitude allowed in the number and size of flat spots than in passenger traffic. A flat wheel, from its very construction, must deliver a blow on the track.

To divide common Maintenance of Way and Structures Expenses, I used the gross ton mile basis.

A train slows up approaching a weakened bridge because on a bridge vibration has a very deleterious effect. When a bridge is weakened, it is necessary for them to go slowly over it in order to reduce the frequency of the vibration so it will not come to a danger point. On a bridge there is always a possibility of accident from the weights passing over it, and if a train is moving at a slow speed and the bridge gives way under the weight, the train will not be thrown off the bridge into the river or ravine, or whatever it is they are crossing. I think that has more to do with the matter than vibration.

My idea is that the slow orders over the bridges are for the prevention of accidents, as an accident is more dangerous at high speed.

The train miles enter into certain of my divisions of accounts. It is used in the item, 202, "Railway Maintenance," page 227 of Defts.' Ex-. 329, 221, "Fences," page 228, 223 "Snow and Sand Fences and Snowsheds," page ——, 225, "Crossings and Signs," page ——, and 372, "Dispatching Trains," page 238.

1700 For Dispatching Trains, inquiry developed that one-third of the dispatcher's time was spent in train movement, and the other two-thirds in the distribution of cars over the line in order to move the freight.

Since the attention of the dispatcher to individual passenger cars is infrequent, I have considered two-thirds of the dispatcher's time to be used in the distribution of freight cars and chargeable directly to freight. I considered it desirable to make the adjustment in this account, instead of burdening account 373, "Station Employees," with this matter.

When a train dispatcher sends an order, there is a reciprocal receiving service at the other end in the passenger station, which — taken care of by the operator there. In making our distribution of station services, we have not considered this time taken by agent-operators in receiving train orders. That we may have recognition of that service, I assumed that, though the train dispatcher's pay is higher than that of the men to whom he is sending the message, just as much of their time, as expressed in money, would be consumed in receiving his orders as of his in sending them. I have, therefore, taken one of the other thirds of his time and charged that to dispatching trains. As I had already charged of- these men's services under my Station Employees a certain percentage of their time to the passenger business, it was necessary to charge only the difference between the two percentages on the second third of the dispatcher's time to the train movement in order to determine the exact amount that should be in station service on this account, but, for convenience sake, had been recognized in this dispatching. This gave me a total percentage of

68.3911%, which, divided by three, gives 22.7967% of the dispatcher's time chargeable to the passenger business. The dispatcher is located at Marquette.

1701 The messages of the dispatcher controlling a train would probably be taken by every operator along the line, as a matter of information to other trains which might want orders or information for the passengers. All the time necessary for such messages and the dispatching of trains is considered by me to be included in this one-third of the dispatcher's time. I have offset the time of the dispatcher and his assistants as against that of the operators who receive the message. The taking of the message by the operator, to post his bulletin according to law, has reference to passenger trains. I did not take into account the question of the train dispatcher's higher salary as compared with the numbers on the other side. The numbers of the station agents would certainly offset the higher wages, perhaps exceed it.

I used engine miles for divisions of expenses, but where that has been used it has been pretty thoroughly agreed upon between us and the railway company. I used other special factors for the division of certain expenses, which are shown in the exhibit. I made a study of the Mackinaw Trans. Co. and assigned its expenses to freight and passenger on the basis that two freight cars equal one passenger car, that being the basis indicated by the road in its division of expenses. The receipts are almost entirely from passengers and taking passenger expenses from the receipts shows the passenger-carrying business of the Mackinaw Trans. Co. to be profitable. The freight cars are handled over the Mackinaw Trans. Co. ferry without charge, and the expenses divided up among the three owning companies. The plaintiff handles the Soo Line freight cars over the ferry, and the net expenses to the plaintiff are split up with the Soo Line on the basis of cars handled. The Soo Line thus participates in the passenger earnings over the Mackinaw Straits. The totals of this divi-

1702 sion have been worked out by Mr. Parker. The profits of the Mackinaw Trans. Co. on the passenger business was, for the various years, 1914 to 1917, as follows: 1914, $30,450.38, 1915, $27,126.71, 1916, $27,814.50, and 1917, $23,483.21; this is the entire profits, and not the plaintiff's share. To arrive at these profits, I have charged against the passenger earnings the passenger proportion of the entire expenses. There is a loss on freight traffic, and the expenses of that traffic are supposed to be divided between the three roads in proportion to the traffic of each. The only way the plaintiff participates in that profit is through its stockholding in that corporation. The basis of any consideration of the Mackinaw Trans. Co. is that plaintiff's trains are ferried across the Straits, and that this is a ferry bridge.

Referring to page 226 of Defts.' Ex. 329, the Mackinaw Trans. Co. operations are not included in my figures, but this company stands on its own feet, leaving the question to include or exclude it at the discretion of the Court. My computations with reference to the Mackinaw Trans. Co. appear in Defts.' Ex. 330.

In my computations, I have stated the Mineral Range as standing

by itself, as an item of expense which can in no wise be considered as having reference to the matter here in controversy. From Houghton to Calumet is a distance of 14 miles. I have taken the expenses which accrued upon and are directly attributable to that run and set them to one side, since the plaintiff received no compensation for that run; the fares all go to the Mineral Range Road, and therefore in the computation to determine the efficacy of the two cent passenger rate on the plaintiff's road these expenses should be set aside before any computation of that character is made. When I say that there is no compensation whatever, I am referring to the collection
1703 of fares on this 14 miles. There is a slight compensation, which I have taken care of, and which Mr. Parker took care of in his exhibits, for two of the trains which run up there, the C. M. & St. P. trains pay a certain rate which might be called a mileage charge, and of that mileage charge I have taken into my earnings on the D. S. S. & A. only the D. S. S. & A. mileage proportion; and against the Mineral Range run expenses, which I have set off, I have credited their proportion, the 14 miles, of this revenue or rental received from these trains, or privilege payment for running these trains.

The expenses set out for the Mineral Range are on a mileage or percentage basis, and I take out the total operating expenses of the train, including Maintenance of Equipment, Fuel, and Train and Enginemen's wages.

I have investigated the average tie life, the renewals and costs of ties, and the number of ties of different kinds of wood, on the plaintiff's railroad, and Defts.' Ex. 331 pertains to that subject. The line at the bottom of the second sheet, "Average for 10 years," shows the average tie life. This was for 10 years ending, in 1911, 11.69 years, in 1912, 11.81, in 1913, 11.38, in 1914, 10.47, in 1915, 10.20, in 1916, 10.14, and in 1917, 9.92.

The costs for ties stated is the price paid for the ties delivered on the plaintiff's property. I think it includes nothing for distribution. The data for Defts.' Ex. 331 was obtained from the company's reports. I find that the price stated is that at the distributing point and I should say includes inspection charges and distribution into a yard ready for use. The I. C. C. interpretation of the account, "Ties," is that it includes the cost, the labor of handling, distributing and putting in track is charged to account 220, "Track Laying and Surfacing," which would indicate that the price includes nothing beyond inspection.

1704 I investigated the reciprocal service which passenger service furnishes for the freight, and vice versa. The freight performs service for the passenger, in hauling company material afterwards commonly used. In my gross ton weight factor, 13, will be found the company material ton miles. The car weights carrying this company material are all included in my car miles as taken from the books of the company, so my gross total weight includes the company material and charges that much of the expense to freight. I have made a computation by primary accounts, to show how much this would affect the total carried. I find the total passenger per-

centage of the freight service due to carrying company material would be 1.1%, that is 1.1% of the freight expenses is undertaken in carrying the passenger material. On the other hand, there is a reciprocal service in passenger for the freight; e. g., in 1915, plaintiff's passenger miles were 29,682,083; that year, annual passes were issued for 2,165,113 passenger miles and trip passes for 2,346,867, a total of 4,511,910, which is 13.2% of the total passenger miles. Reducing these according to the general distribution of payrolls between freight and passenger, the conclusion is reached that 4.9% of the total passenger miles were issued in passes on freight account, which, multiplied by the general average of freight expenses to passenger expenses, gives 1.57% of the total expenses as chargeable to the freight account from passenger service, as against 1.1% of the total chargeable to passenger. 1.57% of my total expenses should be charged to freight and 1.1% to passenger. I have so many passenger miles; the resultant would be the cost per passenger, whether he paid his fare or not, and in freight a ton of company material accounts for just as much as a ton of revenue freight. In taking the payroll, a man drawing $150 a month would count three times as much as a man drawing
1705 $50, but I have no means of determining the specific employees using passes. It might be more nearly accurate to divide it on the employees, rather than the wages, until we come to those employees having duties in both passenger and freight. I think it would be more nearly accurate to divide according to the number of employees, and then to divide the common employees on the basis of those located rather than on the salaries or wages paid. There is no direct relation between wages paid and the miles the man is dead-headed. The only relation would be that passes are distributed over the whole service, and the measure of the pay would indicate the general number of men in the different services. I think it the rule that the employee carried must have transportation. I ascertained the number of miles from the stubs of the passes. This includes passes issued to members of the employees' families. If it was strictly followed out, there would be a slight charge against the freight service and a credit to the passenger—the difference between 1.1% and 1.57%. This does not enter into the computation in Defts.' Ex. 329. By material carried in freight trains, I include coal. It might be well to mention that official cars, in the service of both passenger and freight business, are charged in toto as to repairs to passenger service.

On account 201, "Superintendence," M. of W. & S. 1917, Ex. 329, Summary, page 249, I assigned to passenger $5,012, and Delf assigned $7,811, the difference being caused by the fact that it is an overhead account, treated alike by the both of us, and the underlying accounts are not the same in amounts.

Account 202, "Roadway Maintenance," page 227 of the exhibit I locate on Factor 16, line 9, which separates the exclusive track maintenance, per Factor 14, and the balance on the train mile factor including switching. Mr. Delf used his modified revenue train mile basis for the entire account, setting out his so-called allocated

1706 exclusive maintenance. I used my basis for setting off the exclusive from the common. In this account, maintenance is not dependent on wear, but facilitates the passage of a train as a unit. I believe my method closely approximates the use or tells the cost of maintenance for each service.

In account 208, "Bridges, Trestles and Culverts," my difference of $2,900 plus less than Delf is due to his use of the modified revenue train mile basis, while I divided the common on gross weight basis, Factor 13, as the weight measures the use of the bridge.

In Account 212, "Ties," I charges $12,910 to Michigan passenger, and Delf $21,775, the difference being due to Delf's use of the modified revenue train miles and my use of the gross weight basis for common. Parker and I both used the gross ton mile factor for this account. We differ slightly, because I have included the company materials and carried out my percentages a little farther.

I meant, when I said I had not included or charged for carrying company material, that I had not entered the amount due to company materials on the passenger account and made a like adjustment in freight for service performed by passenger. The total cost of carrying company material is now charged to the freight business, it being offset by the 1.57% of passenger service above described.

As the cost of carrying freigh' employees and their families is included in my passenger expenses, I regarded the 10 tons of passenger loading sufficient to include that. Including company freight, the gross weight basis on common track is 30.108% passenger; ignoring it, it is 30.629% passenger, for 1914.

1707 Accounts 214, "Rails," 216, "Other Track Material," 218, "Ballast," and 220, "Track Laying and surfacing," are assigned by me on the gross weight basis, and by Delf on the modified revenue train mile ratio, my ratio of 21.3972% being further modified by the separation of exclusive tracks, as against Delf's 42.21%. Delf takes out the exclusive in another method, so the percentage would not be comparable at this point.

(If witness followed Delf's method, he would first set off the exclusive track and divide the balance of the common by a different percentag—25.6875% passenger.)

I would first take 17.28% of the total expenses and set it off to freight and .1988% to passenger (Factor 14), and the balance, 82.5238%, I would divide on the gross weight basis of 25.6875% (Factor 13). Instead, I have combined the two percentages into a total percentage (Factor) of 21.3972% passenger (Factor 16). I have combined the equated track and gross ton miles in one factor.

I do not accept Delf's so-called allocation to exclusive track, as my investigation led me to discard the reports of the section men as being incorrect. The records on which plaintiff claims to have separated the maintenance of exclusive track were not records regularly kept in the conduct of the business. It was a side record, kept to meet the order of the I. C. C. to locate everything as far as possible. I do not consider them reliable.

Account 221, "Right of Way Fences," I divided on the train mile basis; Parker on the time ratio.

Accounts 223, "Snow and Sand Fences and Snowsheds," and 225, "Crossings and Signs," are assigned by me on Factor 11-E, revenue train miles plus switching, and by Delf on modified revenue train miles.

In account 227, "Station and Office Buildings," page 229
1708 of the exhibit, both Delf and I allocated to freight certain amounts and to passenger $1,764. The remaining common, of $4,541, Delf assigned on modified revenue train miles, 42.21%. Of this $178.98 referred to the Marquette station. After assigning the excess over that amount, of $4,362.21, on the basis of account 373, the portion of the Marquette passenger item relating to the building commonly used for the general purposes of the line was split 50-50, the results being shown in 227-B.

Account 231, "Water Stations," I divide on the basis of accounts 385 and 397, and Delf on accounts 382 and 394.

Account 233, "Fuel Stations," I divide on the basis of accounts 382 and 394. Delf and I differ on this, in the assignment to Michigan, as he permits the entire expenses to remain in Michigan, while I percent them over the system, on the theory that the use of water or fuel stations extends beyond their actual location.

Account 235, "Shops and Enginehouses," I split between shops and enginehouses, locating the enginehouses to Michigan and spacing the shops over the entire system, charging to Michigan only its proportion of the shops which they have used. 'This is done on Factor 2, line 1, page 208 of Defts.' Ex. 329, showing the repair account in shops as located in Michigan, 81.5%, by splitting the engine repairs on engine miles, the car repairs on car miles, freight and passenger, and the work equipment on work equipment miles, between states, which would result in the proper charge to each state. Those four repair accounts are then combined, and that is the use to which your shops have been put. I consider that a more equitable division than Delf made, as Delf's method leaves the entire shop expense in Michigan, regardless of the fact that work is done for service outside the state.

1709 In account 247, "Telegraph and Telephone Lines," Delf and I agree on the location to Michigan, but he uses modified revenue train miles, while my factor is overhead to the transportation block of expenses. The telegraph service is mainly in the conduct of the transportation business and can well be considered overhead to this business.

Account 249, "Signals and Interlockers," I assigned to passenger on a special investigation of the occupancy of tracks by time and the number of trains, which shows 5.24% passenger. Mr. Delf used modified revenue train miles.

Accounts 265, "Miscellaneous Structures," 269, "Roadway Machines," 271, "Small Tools and Supplies," 274, "Injuries to Persons," 275, "Insurance," 276, "Stationery and Printing," and 277, "Other expenses," we take as overhead, while Delf uses modified revenue train miles.

In account 272, "Removing Sand, Snow and Ice," the 1% to passenger and 70% common was by agreement with Delf. To divide the 70% common, I used train miles plus switching (Factor 11-E) while Delf uses modified revenue train miles.

In account 278, "Maintaining Joint Tracks, Yards and Other Facilities—Dr.," the difference from Delf is only $33.

In Account 279, "Maintaining Joint Tracks, Yards and Other Facilities—Cr.," in the freight, passenger and common assignment, Delf and I agree. The $5,092, common, Delf divides on modified revenue train mile basis. I separate into tracks, roundhouses, water tanks and other common expenses and divide the first three on the basis on which expenses were charged at for these various items for passenger. Delf's credit figure is $6,171, and mine is $5,252.

1710 Under the Maintenance of Way and Structures group, my charge to Michigan passenger is $131,341, and Delf's is $205,704, a difference of $74,363.

Under Maintenance of Equipment, I charge $109,056.64 to Michigan, against Delf's $111,624. In this group, I have assigned a portion of the Michigan passenger to the Mineral Range run. Delf made no similar assignment; e. g., under account 308, "Steam Locomotives-Repairs," we assigned to the Mineral Range that portion of the engine repairs which the mileage of their runs bear to the total passenger engine miles. I charge the Mineral Range run with a portion of the expense of account 309, "Steam Locomotives—Depreciation," 317, "Passenger Train Cars—Repairs," according to the mileage of passenger cars on that run, considering only the South Shore cars; also account 318, "Passenger Train Cars—Depreciation," and account 301, "Superintendence."

Under the group, "Traffic Expenses," there is no appreciable difference between Delf and myself.

Under Transportation Expenses, I have charged against Michigan passenger, for 1917, $347,480, against Delf's $327,337, a difference of $24,857. A number of minor differences between Delf and myself appear in the exhibits. Only the larger items will be here mentioned.

In account 373, "Station Employees," I charged to Michigan passenger, for 1917, $21,986.56, against Delf's $42,781, a difference of $20,795. We both located $79,330.95 to freight and $11,412.97 to passenger, leaving as common $84,072.96. As about 53% of this account had been located to freight and passenger, I divided the common on the basis of the located. I thought it a better factor to take a located expense than to reach over into some outside factor, such as modified revenue train miles, whose bearing on the

1711 question is not particularly direct. I confirmed the propriety of this basis by taking Marquette station, where they had both freight and passenger work and where the force was divided. I then took the freight and passenger receipts for Marquette, and found that for every dollar of freight handled in the city of Marquette the cost was 4.06 plus cents for station service, and that for every dollar of passenger business the cost was 2.617 cents. Applying the 4.06 to the total freight receipts of the road, of $3,394,-

350.53, gave me $137,888.12, and to the passenger receipts, of $668,-898.18, applying 2.617, would give $17,503.65. The comparison indicates a percentage of 11.26421 passenger. I have used 12.5769% passenger.

By freight handled, I mean the receipts at Marquette, for freight received and forwarded. The agent has to take it in and take care of his dollars when they come in, in billing and collections, and when they go out he has to take care of his freight and bill it out. In other words, he has to have dollars in and dollars out. I mean, by freight handled, the freight consigned to or shipped out of Marquette. If freight is received at Marquette it is included; if simply rehandled, it would not appear. This was simply in confirmation of my percentage. The trouble about taking a station which was not a division point was that they haven't the accounts split up into passenger and freight, excepting at points that are subject to criticism. Mr. Delf divides account 373 upon the modified revenue train miles basis.

Account 376, "Station Supplies and Expenses," is treated in the same way as 373.

In account 404, "Signal and Interlocker Operation," I assign 5.24% to passenger, against Delf's 42.12%, modified revenue train miles.

1712 The difference between Delf and me in the item, 372, "Dispatching Trains," and the methods I used, have already been commented upon.

Under Transportation Expenses, I assign from the Michigan passenger proportion to the Mineral Range run various items, aggregating $14,568.07, and Delf makes no similar allowance. Under account 371, "Superintendence," $234.76 is assigned to Mineral Range. I also charge the Mineral Range in account 392, "Train Enginemen," $3,239, being its proportion according to mileage; under account 394, "Fuel for Train Locomotives," $6,384.51, being mileage proportion; I also make charges to Mineral Range in accounts 397, "Water for Train Locomotives," 398, "Lubricants for Train Locomotives," 399, "Other Supplies for Train Locomotives," 401, "Trainmen," and 402, "Train Supplies and Expenses."

Under the group, "Miscellaneous Operations," there is no difference between Delf and myself.

Under the group, "General Expenses," we both divide as overhead to the balance of the operating expenses. There is a necessary difference between us because of our difference in previous assignments. Under this group, I charge passenger with $24,359.49, against Delf's $27,661.

For the year 1917, I have total charges against Michigan passenger of $685,491.51, while Delf has $790,721, a difference of $105,230. This is made up principally in track wear account, maintenance of way expenses, station services, station supplies and expenses, and dispatching trains.

The $19,095.72 charged to Mineral Range would reduce my $685,491 when I come to assign to interstate and intrastate, as that there disappears.

In 1914, an addition to the Thomaston enginehouse, located 14 miles east of the Wisconsin line, necessitated a charge to
1713 operating expenses of about $40,000. This expense I divided to states according to the service rendered by that enginehouse, assigning to Michigan passenger on account of it $4,923.49, which was considerably less than Delf's assignment. My total assignment to Michigan passenger on account 16, "Buildings, Fixtures and Grounds," for 1914, page 33 of the Exhibit, was $11,293.42.

In account 241, "Wharves and Docks," the passenger expenses for repairs of the ship dock at St. Ignace are assigned on the basis of one passenger car equaling two freight cars, which is the method adopted by the company. I call attention to it as that is the basis of our assignment of passenger expenses of the Mackinaw Trans. Co., it being the company's established ratio.

In Factor 11, I include the mileage of light engines, as they receive the same protection by the dispatcher in giving orders as a regular train mile. From my examination of plaintiff's accounts, I find that, outside the freight service, the losses, if any, are incurred in the mail and express and sleeper and diner business. I should say that, so far as the express business is concerned, the matter can be readily cured by contract, as the Soo Line owns the express company and the Soo Line and plaintiff are both controlled by the C. P. R. I treat the mail and express as an outside service.

West of Marquette, the foreign sleeper service is duplicated. While the dining service is furnished principally by the plaintiff, there are diners on the so-called Chicago runs of the C. & N. W. and C. M. & St. P., which are of little, if any, service to the intrastate passenger. They are maintained for the benefit of the through run, with the exception of passengers from Menominee and Escanaba.
I have no method of measuring that service. There is a diner
1714 on the C. & N. W., into the Copper Country, put on at Escanaba. I have shown in my exhibit the outside or auxiliary services separately, with the losses which pertain to each class of traffic.

Defts.' Ex. 332 is the State's claim of valuation in 1913, plus additions and betterments each year since, with an assignment of the values to passenger and freight for each consecutive year, which shows the values and divisions for respective years as follows:

Year.	Total.	Freight.	Passenger.
1914.....	$11,674,752	$9,108,698	$2,566,054
1915.....	11,697,474	9,098,716	2,598,758
1916.....	11,526,134	8,906,240	2,619,894
1917.....	11,875,868	9,231,665	2,644,203

The assignment to services is upon the factors in Defts.' Ex. 329. On the first sheet of the valuation exhibit the factor used is indicated. The additions for each year have been carried forward upon the factor noted. Direct allocations to passenger are marked "P" and to freight "F." For rolling stock, the values of Mr. Kates

were taken for each year and assigned on the basis of the mileages for that year.

For example, all track structures, such as ties, rails and ballast, are divided upon the gross weight basis, Factor 13-A. No exclusive track is set off, as that has been allocated, and does not appear in the common property. My factor of gross weight for 1914 is 30.108%, as against Delf's modified revenue train mile ratio of 45.09%.

I deem it necessary to divide common property on the same ratio or factor as I use for expenses. The reason is that there is a common use of the common property, and if we can find the
1715 factor which governs the use, it must necessarily govern the value which is used. It necessarily follows that, if the Court adopts my division of operating expenses applied to the track structure and roadbed, it must also adopt my division of the property on the same ratio, and if the Court should adopt Delf's division of expenses, I believe it should adopt his division of property.

In dividing expenses, I based all my methods as closely as I could obtain it on the actual use of the property, to the factor which it wears out and therefore shows its use, and when that is done the value of the property would be measured by the expense.

Defts.' Ex. 333 takes the Master's value for 1913 and adds to it from year to year the net additions and betterments. According to the same methods as indicated for Defts.' Ex. 332, this exhibit by the use of factors divides the value to freight and passenger.

Mr. Groesbeck: While items 35, "Engineering on Equipment," 37, "Contingencies," 43, "Working Capital," and the item "Appreciation" are listed on Defts.' Ex. 333, we claim they should not be included in the value.

They are included because the Master included them. Upon Defts.' Ex. 333, the various values are shown as follows:

Year.	Total.	Freight.	Passenger.
1914	$14,451,525	$11,147,160	$3,304,365
1915	14,474,319	11,087,938	3,386,381
1916	14,241,544	10,871,582	3,369,962
1917	14,449,251	11,085,443	3,363,808

For Defts.' Ex. 333, I have used the same unit prices, for 1917, that the Master adopted for 1913, plus the actual expenditures, according to reports, for each account. This means I have
1716 started with the Master's valuation and have made no depreciation since 1913.

Defts.' Ex. 334 is a combination of the Defts.' Exs. 332 and 333.

I have made a study of plaintiff's passenger traffic for the Western Division, from Nestoria west to the state line. The passenger miles on that division were:

Year.	Interstate.	Intrastate.
1916	5,090,983	1,072,032
1917	4,154,501	1,324,074

The constant sleeper costs on plaintiff's railroad, meaning those costs which would remain the same if the sleepers had not been run, as charged in the various accounts of Defts.' Ex. 329 to sleepers, for the years ending, June 30, 1917, were $40,590 for 1916, $42,686, for 1915, $38,326.

From my investigation of plaintiff's accounts and business I find that during each of the years, 1914, 1915, 1916 and 1917, plaintiff was making a fair return upon a fair value of the property used in the intrastate passenger business. That is my judgment.

1717 C. W. HILLMAN.

Cross-examination.

By Mr. Tracy:

I have been a witness in many rate cases of which I have mentioned the most important.

In the Western Passenger Fares Case before the I. C. C. the methods I used in dividing the accounts were substantially those I have used here. After dividing expenses to Michigan, my first effort was to find the amount assignable to maintenance of exclusive freight tracks. In general my method was to take a ratio, assuming it cost half as much to maintain a mile of side track or freight branch as a mile of main line, thus producing an equation resulting in my assigning about 17.27% of the total maintenance expense of track structures such as rails, ties, track laying, surfacing to the maintenance of exclusive freight track. I did not accept the Delf claimed direct allocation of the expenses for 1917, to different tracks because I felt the figures were not correctly reported by employees—they were not correctly assigned to freight or passenger. I referred to section 34 showing the amount assigned to passenger by the section foreman when there was no passenger track there. That assignment appears in September, October, February, March, April, May and June in varying amounts, the year's total being $1,525.54. That is the amount entered in the passenger column by the section foreman. I do not know whether that was corrected at headquarters. I find Mr. Delf assigned to exclusive passenger $793. The errors were in track material. I do not look to see how his labor book checked with that. I made this examination to determine whether the reports were correct and finding them unreliable I paid no further attention to it.

1718 I knew that they were not carried in by the company as a passenger item though reported as such. I abandoned the idea of allocations and undertook to determine the amount by estimate. I did not consider that they were allocations. My estimate is based on the assumption that one to two is the relative cost of maintenance of side track to main line. I confirmed my basis for this figure by taking the total expense for every section and comparing it with the total amount in the section. There was no such report except in 1917 when they commenced to report between freight and passenger. A number of things led me to doubt the accuracy of the report; it is a new innovation, the men are not used to it and I made

this investigation to determine whether I should accept the red books (Defts.' Exs. 335-336) or discard them. I took the total of each section foreman's report of material, priced it with the regular price list and calculated it out. This expense could be allocated if the company gave the proper directions and had bright enough section foremen to report it; they would have to give specific instructions as regards, for instance, a switch located on main track leading to a side track. The work of that switch would be done in main track yet the entire work would be chargeable to the side track.

After I obtained the assignment to exclusive freight track I divided the common portion of the maintenance accounts according to a number of ratios. For several I used the train mile ratio, but for the greater bulk of expenses I used the gross ton miles. Page 218 of Defts.' Ex. 329 shows the basis of my gross ton mile ratio for 1917. That includes the ton miles of company freight. That is included, though not properly chargeable as a freight item, because in my opinion it is more than offset by the free service given by the
1719 passenger train in carrying employees on passes. That is not the reason I included it. The reason for including it is because it is part of the freight service. The object of analyzing it was to determine how much of the freight service should be charged back to passenger. I decided to make no charge of that to passenger as it was more than compensated by the service given by passenger to freight. In the figures of miles on annual and trip passes I included travel by employees and their families for business or pleasure, and annual passes used by officials of plaintiff and other roads including exchanges. They are given to officials of other roads in exchange for passes to officials or employees of this road. If an employee, freight, passenger or common of plaintiff was compelled to make a company business trip to Chicago, an exchange pass would be requested for him. If it was properly company business his expenses would be properly chargeable to operating expenses and to the extent that he was able to travel free on other roads the operating expenses of plaintiff would be reduced. Exchanges passes are given on this theory. I made no attempt to find the amount of exchange passes.

In computing the gross ton mile ratio we take each car and each engine and multiply its weight by its mileage made. We multiply the ton by the distance it moves. That is on the theory that the expense of maintenance of the structures to which this ratio was applied is measured by the weight passing over it during the course of the year by the several classes of business. The ton mile is the measure of expense because in my opinion it causes it. I make no direct computation on account of the speed but it is not lost sight of. Defts.' Ex. 329, p. 219, 1917, contains my computation by which I obtained the apportionment of expenses assigned to exclusive freight
1720 tracks. That is 17.27% to exclusive freight. In other words, equating track two to one I find that 17.27% of the tracks are exclusive freight. It appears that a little under 5% of the tonnage was carried on these exclusive tracks, though I am not sure. (See later testimony.) Assuming the figures of the exhibit to be correct

it would be practically 6.5% of the freight which is made on the main track. Applying the 51,000,000 ton miles made on exclusive freight track to all ton miles on all tracks, freight and passenger, the percentage is 4.9%. This 17.27% is no theory, it is a fact. If they do not reconcile it is correct that my theory is wrong and the fact right. I think, you will find the facts in consonance with the theory.

Page 235, Defts.' Ex. 329, shows accounts 326, 327 and 328, Work Equipment divided between passenger and freight as overhead to the maintenance of way and structures expenses. The 1-8 factor opposite account 326, should be 1-7. Account 328, Work Equipment Retirements, I assigned to services on factor 1-17, not on 1-7 as misprinted.

Accounts 326-328, Work Equipment Repairs, Depreciation and Retirements, were all assigned to services on the same percentage, 1-17; in assigning these accounts as overhead to the maintenance of way group I follow the same theory as Delf. Whatever way the court decided, they would follow the apportionment of maintenance of way expenses.

Defts.' Ex. 329, p. 238, station employees—the common portion, I have divided between passenger and freight on the basis of the allocations using the same allocations as Mr. Parker. The allocations were checked over with Mr. Delf. The stations that I used were the Soo, St. Ignace, Marquette, Negaunee, Ishpeming and Houghton, being the points where the allocated expenses principally occur. I do not know what the allocations for Negaunee
1721 were; if they were common $416, freight $50 and passenger $150, that would settle the allocated expenses at Negaunee but would be too incomplete a basis for any computations for the balance of the road. If it appeared at Ishpeming that the expenses were, common $537, allocated freight $892, passenger $5, that would truly express the relation of the passenger and freight business at that station. I tested out the accuracy of the 12+% passenger by a computation as to the amount of money handled by the freight office and by the passenger office. While that is not proper cost accounting in a large station, the cost of handling a dollar of business of each class and applying that to the total number of dollars handled on the line would give an idea as to what the result would be had they both grown to the point where they could have a freight and passenger man to handle them. If the passenger fare were reduced from three to two cents the ratio would go down. We cannot use the gross earnings basis in any way save as a fact of general confirmation. It is a test only to see if your computations are excessive either way. If I had found that it run down to two or three percent or gone up by 40% or 50% passenger, I would feel that there was something wrong with my computation using 12%+. If one station handled nothing but iron ore or coal and another was a shipping point for furniture there would be no comparable unit which could be arrived at on the amount of money received or handled. My confirmation proves nothing except that for every dollar the agent handled in passenger there was an expense of 2.6¢ and in freight 4¢+. It proves nothing save setting a general test to determine

whether or not you have passed the boundaries of probability, either higher or lower. The division of 376 station supplies and expenses, is dependent on 373 station employees, in part as is 227, re-
1722 pairs to station buildings. The idle time of employees at different stations varies. I presume there is a considerable portion of the time when the men are not busy. At small stations where the agent is not as busy as at a larger station, his compensation is sometimes based upon the importance of his station. Defts.' Ex. 329, p. 246, Accounts 452, Clerks and Attendants in General Offices, 453, General Office Expenses and Supplies: the common portion is assigned on factor 12-15 and 9-15 is a misprint. Those "9" factors are all misprints for "12."

The group "general expenses" were assigned by both Delf and myself as overhead to all other groups and changes made in the other groups would be reflected here. To divide the passenger expenses between inter and intra state I used the passenger miles the same as Delf, except as to station accounts. I assigned station employees to inter and intra on intra factor 1, p. 224, Defts.' Ex. 329. That is on the time of the agent consumed in sale of tickets. I differ from Parker who assigns on the relation of passenger miles and Delf who assigns on the relation of passengers travelling. The effect of my calculation: coupon tickets and simplex (card) was to reduce Delf's ratio from 88.78% intra to 88.07%. To reach my basis (Referring to p. 156, Defts.' Ex. 329, 1916) I had one of my men go to each train for a period of six weeks and with a special watch test the time it took the agent to dispose of a passenger and find out what class of ticket the man was getting. I found it took an average of about ten seconds to handle a simplex or Mineral Range ticket; it took 50 seconds average, to sell a coupon ticket, it being there necessary to punch limits on the side and possibly look up facts with which the agent is not familiar. On coupon tickets, interstate and in-
1723 trastate the average time was about 5.75 times as long as for the card or simplex ticket; I then determined how many simplex tickets were sold in inter and in intra state. I then found how many tickets other than Mineral Range, were sold and multiplied each of the inter and intra coupon ticket sales by 5.75. On the mileage handled by agents I used the same percentage. From the results of these figures I found the elapsed time in seconds to be intra 536,672, inter 75,136, or that intra tickets represented 87.55% of the agent's effort to sell them. On timing sales of sleeping car tickets we found the time selling and making the entry ran about with the coupon ticket, though we made no computation based on this. I have made a separate assignment of expenses to the operation of sleepers and diners including chair and observation, mail and express cars, having shown results separately for sleepers and diners. This is the first case where I have made that assignment though I have always had it in mind. I used it to a limited extent 7 years ago in an express case in Minnesota. That was to get information as to the amount the Wells-Fargo was paying for express service on the St. Paul. This is the first time I have gone into it in detail in a passenger rate case. From my exhibit you could determine the net

revenue from plaintiff's freight business by subtracting my Michigan passenger expenses from my total expenses and apply the balance to the Michigan freight revenue.

My division of revenues and the equipment accounts, between passenger and freight would correspond with those of Mr. Parker sufficiently for comparison.

Redirect examination.

By Mr. Groesbeck:

Page 218, Defts.' Ex. 329: The heading "all tracks" is in error. It was my intention when I first set up this data to add under
1724 the head of "all tracks" the train weights on exclusive freight tracks, which were outside of train and yard switch. We found that a task of considerable magnitude requiring much data and as we did not intend to use it omitted it. Inadvertently I allowed the heading "all tracks" to remain and the heading is misleading as there will be freight movement where there are exclusive freight tracks—could not possibly be the same as common tracks. The figures under that heading included the switching tonnage and do not include any tonnage on the exclusive tracks or in ore movement.

Recross-examination:

The items in the first column on p. 218 are the cars, locomotives and loading of the trains on plaintiff's road as distinguished from the movement of cars and equipment on common track. In addition to the train movement on common track or in train or yard *yard* switching, there would be whatever movements there were over exclusive freight tracks of which there is 12.07 miles main track, 20.87 miles ore spurs, 20.76 industrial spurs, and 116.71 sidings. The freight main track and ore spurs would certainly have a movement which has not been considered in our train or yard switching. The 12.07 miles of main track I obtained from Mr. Parker and it was checked with Mr. Delf. The detail shows 4.23 miles Negaunee to Winthrop Junction; 2 miles Republic Branch, 3.8 Fiborn Quarry branch, 2.3 Bessemer Branch. I do not think the mileage on all these branches is included in the switching miles. It is now my claim that the figures shown in the first column "All Tracks" with the train movement are the total tons of train movement on common track only. Delf's Ex. 204, p. 14, gives the total Michigan freight net tons, one mile as the same. I judge that would represent Mr. Delf's calculated ton miles for the road It does not indicate
1725 a mistake in my exhibit under "Common Tracks;" it may occur from the fact that the computation of Delf's ton miles was from the billing point. If it included the whole amount it would be necessary for us to reduce the tonnage on common track. I claim a train movement on 12.07 miles of exclusive main line track and 21.87 miles of ore spurs as distinguished from switch movement and not fully included in my switching miles. I do not know it to be the fact that the service on the Fiborn Quarry, Bessemer and

Republic Branches is entirely switching. To arrive at the ton miles of yard switching, the tonnage engine miles in the yard were calculated and to that was added 4.8 cars per movement with their average weights, in the method pointed out by Mr. Parker. The average percentage of loaded and empties is taken. The average percentage of load for the switching movement is the average loading of cars on the road. I do not know how Mr. Delf made his computation of ton miles. I took his figures for that.

1726 C. W. HILLMAN, recalled.

Examined by Mr. Groesbeck:

Defts.' Ex. 339, assigns the passenger values, shown on Defts.' Ex. 332, to the different classes of service, 1914-1917. The method of assignment is shown in the column headed "Factor." In account 36 appears the Soo Union Depot all charged to passenger and baggage, though a study might be made whereby we would assign it to different services. The production of the overhead percentage is shown on the lower left hand part of the exhibit. In the division of the passenger and baggage expenses to inter and intra, accounts 17 and 36 are divided on my intra factor 1, as they are both station accounts and divisible on the basis of station services. The balance of the account I divided on intra factor 3, the intrastate passenger mile percentage. The second and each alternate sheet of the exhibit shows the net intrastate passenger return applicable to investment and the percentage of return for fiscal years ending June 30, 1914, 1915, 1916 and 1917, before the payment of taxes which I intend to rework. For 1914 a credit to intrastate passenger and baggage of $422,217 is shown. We have a loss on sleepers for 1914 of $108,145 Parker's Ex. 313, shows the intrastate percentage of sleeping car passenger miles in 1916 as 30.62%; this being the nearest year's percentage, we apply it to the loss for 1914 and at this point absorb 30.62% of the loss on sleepers or $33,114. Our loss on diners at the same point, Defts.' Ex. 329, is $70,990.39, the nearest factor is to assume that the diner service will be proportionate to the men that ride in sleepers, it may or may not be accurate, but it is nearer the proper amount than a passenger mile basis. On that assumption we absorb a loss on diners of $21,737. We must also absorb taxes to get the net result and finding that they amount to 1.7495% for the year, we have $13,995 taxes which would accrue on the passenger and baggage business. The taxes on sleeper and diner property,
1727 assuming 30.62% intra, are also absorbed. Deducting the amounts to be absorbed $74,231 from the $422,217 profit, we have a net profit of $347,986 for 1914. The total value of the intrastate passenger property including passenger and baggage, sleepers and diners, is $1,107,730, upon which the percentage of net return shown is 31.41% or after allowing the loss as computed by Delf, 19.56%. This is after absorbing both the expenses and values of the sleeper and diner service. I suggest this point: that the bulk of the traffic wherein the losses occur is interstate; only 8.8% of

the intrastate passengers out of 23,000,000+ miles, passenger in 1917, used the sleepers and 33+% of the interstate passengers out of 9,800,000 passenger miles used the sleepers, which are the heaviest cars they have and the heaviest expense that is incurred. I believe the South Shore derived the return shown, on the value of the property used in intrastate passenger business, in 1914. Mr. Delf's figure for the value of intrastate passenger property is $2,741,000 this being what the Master found. The difference between my intra passenger and the Master's is due to the difference in method of assignment to passenger and that he uses a different percentage to assign to the intra its proportion of the sleepers and diners. My total valuation is $2,566,054, and my passenger value is $1,107,730, of which I assign approximately one-half to intrastate passenger. The sleeper and diner business are responsible for it as there is no difference in the cost between inter and intra passenger on this road save the slight excess to intrastate on account of the station services. I arrived at the results for subsequent years in the same manner as described for 1914. The results are as follows:

1728

Year.	Total intra valuation.	Net return.	Per cent return.	Per cent return allowing loss.
1914.....	$1,107,730	$397,986	31.41%	19.56%
1915.....	1,174,267	210,454	23.03	12.37
1916.....	1,196,698	288,127	24.07	13.55
1917.....	1,292,659	319,583	24.72	13.13

Referring to the so-called constant costs for 1917, in the expenses charged out on my Ex. 329 to sleepers, diners, mail and express, certain expenses would exist if there was no such business: e. g. to illustrate, Account 201, Superintendence, 202, Road Maintenance, 221, Right of Way Fences. These are examples, my exhibit will set forth each account and the amount.

I furnished Mr. Dadson some data for his exhibit, No. 319. I obtained it from the annual reports of the Company filed with the State (evidently printed reports) containing expenses. I told Mr. Delf I would examine into their capitalization and asked him for the data which the Company had. They had furnished these books for the benefit of the Interstate Commerce men who were examining on this point. I requested Delf to leave the books there, which he did, and I used them while at Marquette. The accounts taken from those printed reports were afterwards checked over by Mr. Dadson in Lansing and minor changes made in them from the sworn reports.

Defts.' Ex. 340 shows the so-called constant operating costs by primary accounts, assigned to sleepers, diners, mail and express, for 1915, 1916, and 1917. They would remain constant even if the sleepers, diners, mail and express had been eliminated from the train consists.

Defts.' Ex. 341, is a statement showing the amount paid employees of the Soo Union Depot for the year ending June 30, 1917. This is taken from the joint accounts and does not appear in the

1728*a* item "Station Employees." Dividing one-half to Soo Line, I find the amount paid passenger employees to be $3,044. It was not included in the allocation of amounts to station employees at the six stations listed from which I obtained a passenger percentage of 12.6. Including it would raise my 1917 passenger percentage to 15.4.

Defts.' Ex. 342 shows the amount of Maintenance of Way and Structures accounts assigned by me on various factors, 1914 to 1917 inclusive.

I have had experience with reference to the effect of a reduction in rate as stimulating business. At least one experience along that line, in the case of Louisville and Nashville v. Florida; the rate was reduced from four to three cents. The railway claimed the traffic had reached the maximum and a reduction in fare would be followed by a reduction in earnings. Before the final hearing of the case, which ran three years with the three-cent rate in operation, the earnings more than doubled. I attribute that both to the growth of the country and the reduction of rate. There has been a steady growth in passenger traffic in Florida during the last decade, though this road is outside the excursion limits or belt. In my opinion, there is stimulation of business where the rate is reduced, though the amount can only be determined by experiment.

1729 W. W. WALKER, recalled, before the Court on Dec. 7, 1917, by plaintiff in rebuttal.

Direct examination.

By Mr. Tracy:

I reside in Duluth; am and have been plaintiff's vice-president and general manager six years. Have been in plaintiff's employ since 1890 in the capacity of travelling freight agent, assistant general freight agent and general freight agent, the latter for 10 years prior to being general manager. The Mineral Range Railroad Co. stock is owned by plaintiff 52% and by Tamarack & Osceola Mining Co. 48%. It is managed by a separate board of directors on which the minority stockholders have large representation. The operating officials are the same as plaintiff's but the accounts are kept separately. The Mineral Range is an old railroad and I understand was in operation prior to the construction of the M. H. & O. to Houghton. The Mineral Range operates, the shore line between Hancock and Lake Linden, and from Gay to Traverse Bay on a leased line. At one time it operated passenger trains between Calumet and Houghton. The building of a trolley line between those places caused them to discontinue the passenger operations. The center of population of Houghton County is Calumet, it being the largest center of population on the South Shore. The trolley line practically destroyed the passenger earning power of the Mineral Range. We were unable to pay operating expenses. We operate on the Shore line now, as there is no trolley from Houghton or Hancock to Lake Linden and we must furnish the service. The plaintiff commenced

operating its train on the Mineral Range to Calumet prior to 1911—10 or 12 years ago. The reason for its doing so was that to secure business for our line we had to go where it originated; we used through trains where the volume of business was the largest. Train No. 2, Calumet to St. Ignace is started from Calumet and the extra expense of the Mineral Range run paid as there is a great deal
1730 of business originating at Calumet destined to lower Michigan points and by starting our train there we get it as against its going via Chicago. The competition through Chicago for any line is very great. People want to go through there; unless there is an attractive route by some other line, they will go through Chicago. The Copper Range and C. M. & St. P. run a solid through vestibule train from Calumet to Chicago. The Copper Range is separately owned and not controlled in any way by the plaintiff. The trains between Calumet and St. Ignace are No. 1, going east and No. 2, going west. The same reasons exist for No. 1, going through to Calumet as for No. 2, starting there. Train 16 from Calumet, at night, connecting with 7 and 8 at Nestoria, is operated from Calumet for the same reasons as 1 and 2. There is also a sleeper on that train for Duluth with which we encounter active boat competition during seven months of the year. 16 has one sleeper to Duluth and one to St. Ignace. The St. Ignace sleeper meets competition by way of Chicago. Our train No. 3, starts at Marquette and at Negaunee picks up the C. & N. W. equipment going to Calumet. It is our crew, locomotive and baggage cars and the rest of the equipment is C. & N. W. and Pullman cars maintained by it. Previous to our arrangement with C. & N. W. train 3, operated with our own equipment. 103 is the C. M. & St. P. train, Champion to Calumet, hauled by us, with their equipment, maintained by themselves, with our locomotive and crew. The plaintiff gets the fares on trains 3 and 4 and 103 and 104 and in addition we receive about $14,000 a year rental. It would be impossible to obtain this revenue from either road if our train ran only to Houghton, as the C. & N. W. train was in competition with the C. M. & St. P. road over the Copper Range to Calumet, and both trains must go through to Calu-
1731 met. As a railroad official and manager I feel that it is worth enough for our railroad to go into Calumet to make the arrangement we have by which we run our train through to Calumet over the Mineral Range and allow it to keep the portion of the fare made on its line. The Mineral Range gets the fares on the trains Calumet to Houghton and we receive from both the C. M. & St. P. and C. & N. W. $14,000. We have a similar arrangement on our lines at Marquette with these same railroads. They operate their trains and we get the revenues. The C. & N. W. runs a train of their own with their own crew Negaunee to Marquette in the morning, pay all the expenses of the train's operation and our road gets all the fares. They want to go to Marquette to get the business originating there. Like us they encounter competition. The train originates at Negaunee, goes to Marquette and then comes back and runs to Chicago. The C. M. & St. P. goes to Marquette, ties up there and starts from there in the morning.

As general manager my particular duty is to make money for the railroad and its stockholders. I attempt to get as much revenue as I can. The intrastate freight revenues are as much as we are able to obtain. Starting in March this year we attempted an increase in interstate freight revenues; we filed a tariff to that effect and the I. C. C. suspended it. At the same time we attempted increases in our intrastate freight rates. Under an agreement with the Michigan Railroad Commission we withdrew the tariffs to await the action of the I. C. C. Thy told us if we did not withdraw them they would suspend them.

The statistical miles travelled by sleeping car passengers intrastate 33%, interstate 67%, do not altogether reflect the true conditions of travel on our road from one portion of Michigan to another.
1732 Considerable travel from the Gogebic Range, Hurley and Ironwood to the Marquette Range and the Copper Country, goes out on the C. & N. W. to connect with us at Saxon, making that an interstate journey. They go 15 miles into Wisconsin and come back 15 miles, and that appears in the statistics as an interstate journey. There is much business from points on our line that goes from Michigan to Michigan through Chicago. A considerable amount of the traffic between Marquette Range and Copper Country and Gogebic Range is sleeper travel. A considerable portion of the mileage on passes was that of persons travelling on exchange passes. Our employees travel on other lines on exchange passes on company business and this is not shown in our operating expenses. The amount represented by this would be considerable. I imagine the exchanges we get on other roads would be larger than we give, as we are in an isolated country and all our men who want to go anywhere have to go as far as Detroit or Chicago to get started.

Cross-examination.

By Mr. Carr:

If employees of other roads wish to travel over our road for pleasure, exchange passes permit them to do so without paying fare.

The traffic originating and terminating in Michigan is controlled by interestate rate. Our application for increased freight rates was on the theory that the intrastate freight rates should be increased and to the I. C. C. on the theory that our interstate rates should be increased. The proposition of increasing the interstate freight rates is now pending before the I. C. C. and is not yet determined. The effect of increased freight rates would be an increase in gross earnings. If we get 15% increase of all freight traffic it would give us $450,000 in round numbers. We now consider that insuffi-
1733 cient, we ought to have more. It should be at least 20% on both inter and intrastate freight. The Canadian Pacific controls both the Soo Line and South Shore. The C. & N. W. and C. M. & St. P. trains to the Copper Country are pulled by South Shore locomotives; we use our larger passenger engines on those trains. The C. & N. W. train is made up of a South Shore locomotive and baggage car and C. & N. W. car, coach, reclining chair car,

Pullman car and dining car, making a heavy train. This requires a pusher up L'Anse Hill. Because of the size of these trains the train crew is increased by one flagman. The C. M. & St. P. trains are equally heavy, about of the same consists. The pusher takes the trains from L'Anse to Summit. The sleepers run to Calumet to pick up through traffic to points south. One reason for this is the competition of the Copper Range. The sleeper on #16 for Duluth, we take to Calumet and back because of the water competition to and from Duluth. The C. & N. W. train at Marquette uses all the stational terminal facilities. We get the fares and the rental and keep the tracks and station in repair and our employees then serve the train. When under its own management the Mineral Range independently ran trains from Houghton to Calumet and took care of the local traffic. The interurban line which forced the Mineral Range to take off its passenger trains was built about fifteen years ago. Then the plaintiff proceeded to operate the trains for the reasons given. A large proportion of the passengers Calumet to Houghton are through to other parts of the system; the local people use the traction line.

1734 The respective parties have agreed upon the foregoing statement of the evidence as being a full, true, proper and complete statement thereof, and consent that the same may be approved by the District Judge, not intending, however, to waive the right to have further evidence returned as provided by the rules in case it shall later be found that anything is inadvertently omitted.

ROGER I. WYKES,
Attorney for Appellants.
JOHN E. TRACY,
Attorney for Appellee.

I hereby approve of the foregoing statement of the evidence in this cause as a sufficient compliance with equity rule 75, and direct that the portions thereof included in the exact words of the witnesses be so returned.

C. W. SESSIONS,
District Judge.

Dated October 30", 1918.

ELMER W. VOORHEIS, *Clerk.*

1735 UNITED STATES OF AMERICA,
Eastern District of Michigan, ss:

I, Elmer W. Voorheis, Clerk of the District Court of the United States for the Eastern District of Michigan, do hereby certify that the above and foregoing is a true copy of Volume 4 of Narrative Statement of Testimony on Appeal comprising typewritten pages num-

bered one thousand three hundred and twenty-four to one thousand seven hundred and thirty-four inclusive, in the therein entitled cause as the same appears on file and of record in my office; that I have compared the same with the original, and it is a true and correct transcript therefrom and of the whole thereof.

In testimony whereof, I have hereunto set my hand and affixed the seal of said Court, at Detroit, in said district, this twenty-first day of November, in the year of our Lord one thousand nine hundred and eighteen, and of the Independence of the United States of America the one hundred and forty-third.

[Seal of the U. S. District Court, Eastern District of Mich.]

ELMER W. VOORHEIS, *Clerk.*

1736 UNITED STATES OF AMERICA:

In the Supreme Court.

ALEX. J. GROESBECK, CASSIUS L. GLASGOW, CHARLES S. CUNNINGHAM, Addison A. Keiser, et al., Defendants and Appellants,

vs.

DULUTH, SOUTH SHORE & ATLANTIC RAILWAY COMPANY, Plaintiff and Appellee.

It is hereby stipulated and agreed, by and between the above named parties, as follows:

The Clerk shall print so much of the record in said cause as is designated below by the Appellants and the Appellee, respectively.

(Designation by Appellants.)

Bill of Complaint. (Filed July 26, 1911. Docket No. 1.)

Order for Hearing, Application for Interlocutory Injunction, and Temporary Restraining Order. (Filed July 26, 1911. Docket No. 6.)

Answer. (Filed Dec. 2, 1911. Docket No. 21.)

Replication. (Filed Dec. 26, 1911. Docket No. 22.)

Order appointing Special Master. (Filed May 17, 1912. Docket No. 42.)

Opinion on Motion for Preliminary Injunction. (Filed May 29, 1912. Docket No. 45.)

Order continuing Preliminary Injunction conditionally. (Filed May 29, 1912. Docket No. 48.)

1737 Bond of Complainant in pursuance of Order of Court dated May 29, 1912. (Filed June 13, 1912. Docket No. 48.)

Order Continuing Restraining Order. (Filed Jan. 23, 1913. Docket No. 65.)

Memorandum Order in re Deposit in Clerk's Office of Bank Receipts of one-third of Plaintiff's Gross Earnings. (Filed Oct. 25, 1915. Docket No. 78.)

Order regarding Fund to secure Payment of Refund Coupons. (Filed Oct. 29, 1915. Docket No. 80.)

Stipulation as to Certain Exhibits (substituting duplicates, on account of originals missing). (Filed Feb. 1, 1917. Docket No. 337.)

Report of Special Master, Herbert L. Baker. (Filed Feb. 1, 1917. Docket No. 340.)

Defendants' Exceptions to the Report of the Special Master. (Filed Feb. 20, 1917. Docket No. 343.)

Complainant's Exceptions to the Report of the Special Master. (Filed Feb. 26, 1917. Docket No. 344.)

Opinion on Pleadings and Proofs. (Filed Jan. 9, 1918. Docket No. 362.)

Final Decree. (Filed Feb. 14, 1918. Docket No. 368.)

Petition for, and Allowance of, Appeal, and Assignment of Errors. (Filed March 6, 1918. Docket No. 369.)

Citation, with Acceptance of Service. (Filed —— —, 1918. Docket No. —.)

Motion and Order enlarging Time for docketing Appeal and filing Record on Appeal, and Second Citation, with Acceptance of Service. (Filed —— —, 1918. Docket No. —.)

Motion and Order of Sept. 13, 1918, extending Time for docketing the Appeal and returning the Record.

Stipulation re Exhibits, dated Sept. 16, 1918.

1738 Statement by the Defendants and Appellants for the Purpose of limiting the Record on Appeal.

Statement of the Testimony taken before the Special Master and before the District Court and returned to this Court, together with the stipulations of counsel and the orders of the District Court regarding the Testimony and Exhibits to be returned. The marginal record pages found opposite the testimony were inserted for the convenience of counsel and need not be printed.

The Præcipe directing the Return of the Pleadings, Testimony and Exhibits by the Clerk of the District Court.

A sufficient number of the printed comparison of valuation exhibits (Complaniant's 1, 1*a* and 40 and Defendants' 15) have been printed so that the Clerk will be furnished with the requisite number. The report of the Special Master, Plaintiff's Exhibits 201 to 210 inclusive, and Defendants' Exhibits 325 and 329 have been printed, and the requisite number of printed copies for use in making up the record will be furnished to the Clerk.

(Designation by Appellee.)

Plaintiff's Exhibits 33, 35, 36, 43, 52, 53, 54, 55, Sheets 5, 7, 11 and 14 of Plaintiff's Exhibit 67, Plaintiff's Exhibits 68, 201*a*, 201*b*, 201*c*, 220 and 221.

It is also stipulated and agreed that, instead of printing the Exhibits mentioned above as designated by the Appellee, the Clerk may, if the Appellants shall so direct and the same shall be satisfactory to the Court, cause said Exhibits to be reproduced by the photographic process.

Dated March 20, 1919.

ALEX. J. GROESBECK,
LELAND W. CARR,
Attorneys for Defendants and Appellants.
WM. D. McHUGH AND
JOHN E. TRACY,
Attorneys for Plaintiff and Appellee.

1739 [Endorsed:] File No. 26,845. Supreme Court U. S., October Term, 1918. Term No. 759. Alex. J. Groesbeck et al., Appellants, vs. Duluth, South Shore & Atlantic Ry. Co. Stipulation in regard to printing record. Filed April 7, 1919.

1740 COMPLT.'s EX. No. 33, DELF, OCT. 4", 1912.

Filed February 1, 1917, at — o'clock — M. Elmer W. Voorheis, Clerk, by Carrie Davison, Deputy-Clerk.

Complainant,

vs.

Former C. C. No. 4117.

GRANT FELLOWS, CASSIUS S. GLASGOW, LAWTON T. HEMANS, C. S. CUNNINGHAM, ET AL.,

Defendants.

REPORT OF HERBERT L. BAKER,

Special Master.

(Filed February 1, 1917.)

The Bill of Complaint in the case was filed to restrain the operation of, and to relieve the complainant from, compliance with Act 276 of the Public Acts of Michigan, of 1911, which reduced the rates of fare permitted to be charged by railroad companies operating in the Upper Peninsula of Michigan.

The complainant, a corporation organized under the general railroad laws of Michigan, operates a railroad

of approximately four hundred seventy-five miles, crossing the northern peninsula of Michigan from Sault Ste. Marie upon the east to the Wisconsin State Line upon the west, the complainant doing both an intrastate and an interstate business in Michigan.

In 1911, the Michigan Legislature, by the Act complained of, Act 276, reduced the rate of charge for the carriage of passengers for railroad companies operating in the Upper Peninsula from three to two cents per mile for all those companies, the gross earnings of whose passenger trains as reported to the Commissioners of Railroads for 1906 equaled or exceeded $1,200 per mile of road operated; this act permitted three cents per mile to be charged for all distances not exceeding five miles, and also required children under the age of twelve years to be carried at half fare.

The grounds for relief alleged in said bill and made the basis of the prayer to restrain the operation of the statute as applied to the complainant, were the following:

(1) That the act, though applicable in terms to intrastate passenger carriage only, will, by its necessary and direct effect, cause the reduction of interstate passenger fares, for which reason it is unconstitutional, as interfering with interstate commerce. This point has been disposed of adversely to the claim of the complainant in the *Minnesota Rate Cases* and associated cases.

(2) That said act deprives the complainant of its rights of property in violation of the Fourteenth Amendment, in that said rates are unreasonable and inadequate, and therefore confiscate its property.

(3) That the said rates do not afford sufficient or reasonable compensation for the service required to be rendered in consideration thereof.

The answer to the bill upon behalf of the state officials

made defendants, denies practically all the material averments of the bill as to the effect of the Act in question upon interstate business rates, and upon the amount of return which would be permitted to complainant upon its property necessarily engaged and used in carrying on its business and in the several classes or parts thereof.

After the cause was at issue, I was appointed Special Master to take proofs and report thereon. Very extensive records, consisting of 12,000 pages of oral testimony taken and reduced to writing, and many exhibits, were presented by the proofs of the respective parties. Numerous briefs were prepared by respective counsel, and there was an exhaustive oral argument. I then prepared a proposed report and furnished counsel for the respective parties with copies thereof, and stated to them, in substance, that the report was intended to cover everything except the question as to what is required to constitute a sufficient rate of return, which question I reserved for consideration until it should be known whether the rate of return shown by the report would be materially affected by my consideration of the objections which counsel might make thereto. I also further stated to them as follows: "In dealing with such a mass of material and such a multitude of questions, many of which were very perplexing, errors or omissions are almost inevitable, and I am particularly desirous that counsel will call my attention, either by way of objection or otherwise, to everything thought to be erroneous, so that it may be duly considered.

Counsel were requested to serve copy of their objections on opposing counsel.

Thereafter counsel for each party filed objections, as requested, and I then requested that counsel for each side should answer the objections of the other side. Counsel for complainant thereupon answered in detail all

of the objections of counsel for the defendants, excepting only those with reference to which defendants made no argument but stated that they reserved the right to make the objection to the Court. Counsel for the defendants did not answer the objections made by the complainant, but did answer complainant's reply to defendants' objections.

On careful consideration of these objections, I found that some errors had been made in my findings of facts, and also found occasion to change my views with reference to other questions of fact, and in some instances with reference to matters of law, and also found occasion to discuss further some of the more important questions involved. This report embodies the said tentative report with such changes in and additions to the same as were thus found to be required. All such changes and additions are, I believe, fully noted and explained either in my discussion of the various objections or elsewhere. I found it desirable also to make some slight changes in the language of the tentative report for the sake of clearness, and in many instances percentages and other figures are necessarily different. These changes I have not in general noted, because they are of no interest or importance to the Court and they will be readily recognized and understood by counsel. The exhibits which were attached to the tentative report have been revised accordingly.

I have attached to my report the objections of the respective counsel, together with my answers thereto. With reference to such answers, I found it desirable, for the sake of perspicuity, to embody them as far as practicable in the main body of the report and in immediate connection with the subject to which they relate. This I have done, and wherever an answer is so embodied, I have not repeated it in the answers attached, but have

there stated instead where it would be found in the body of the report.

These objections cover substantially the entire case and involve a great many questions, but I have been able to consider those questions fully without the aid of further oral argument by reason of the fact that I have had before me not only the voluminous printed and typewritten briefs submitted by counsel, but also a complete stenographic report of the very full oral arguments heretofore had in the case.

I have embodied in this report a statement of the method adopted for the division of passenger property between the interstate and intrastate services, which statement was inadvertently omitted from the tentative report.

The defendants request me to find, and I so find, that in the determination of this case, the following principles are to be recognized:

(1) The right exists in the state to regulate the rates of public service corporations and of those who devote their property to serving the public. The principle being fixed, the question remaining is, what are the limitations upon it?

Granger case, 94 U. S., 113, 155, 164, 179.
Railroad Commission Cases, 116 U. S., 307.

(2) The authority of the state to regulate rates is not without limitation. That authority is to declare and fix reasonable rates, taking into consideration both the interests of the property owners and the public. The generally expressed and controlling limitation is that vested rights of property cannot be destroyed by the fixing of rates so low as not to be remunerative. In other words, the value of the property cannot be destroyed by

taking away the ability to earn a reasonable return upon it.

Reagan vs. Farmers' Loan & Trust Co., 154 U. S., 362.

Smyth vs. Ames, 169 U. S., 466.

(3) The authority to determine reasonable rates by a state, through its legislature or a regularly constituted commission, is subject to judicial review, to determine whether the return permitted is sufficient, or whether vested property rights are in fact interfered with or destroyed.

Chicago & Grand Trunk vs. Wellman, 143 U. S., 339.

Reagan vs. Farmers' Loan & Trust Co., 154 U. S., 362.

(4) The owner of the property devoted to a public use is entitled to maintain a schedule of rates sufficient to pay a fair and reasonable return upon the value of the property devoted to the public service.

San Diego Land & Town Co. vs. National City, 174 U. S., 739.

Willcox vs. Consolidated Gas Co., 212 U. S. 19.

(5) The value is not dependent upon the original cost of the property, the amount or value of stocks or bonds issued, or the value as influenced by past earnings. The cost of reproduction, allowing for depreciation sufficient to reduce the property to present condition has, in certain cases, been treated as the value.

San Diego Land & Town Co. vs. National City, 74 Fed. 79; 174 U. S. 739.

Smyth vs. Ames, 169 U. S., 466. 546.

San Diego Land & Town Co. vs. Jasper, 189 U. S., 439.

Knoxville vs. Knoxville Water Co., 212 U. S., 1, 9.
Seaboard Air Line vs. Ry. Commission of Alabama, 156 Fed. 792, 806.
Louisville & Nashville Ry. & Light Co. vs. Milwaukee, 87 Fed. 577, 584.
Matthew vs. Board of Corporation Commissioners of North Carolina, 106 Fed. 7.
Railroad & Telephone Companies vs. Board of Equalizers of Tennessee, 85 Fed. 302.
Cotting vs. Kansas City Stock Yards, 183 U. S., 79.

(6) In the case of a property engaged in both interstate and intrastate business, where the question is the sufficiency of the rates under a state regulating statute, the interstate earnings and property must be eliminated and the intrastate rates and earnings applied to the property engaged in that business, to determine the sufficiency of the return.

Smyth vs. Ames, 169 U. S., 466.
Arkansas Rate Cases, 187 Fed. 290.
Minnesota Rate Cases, 230 U. S., 435.

(7) While no fixed rate of return is applicable to all properties, the rule seems to be that the rate of return to which a property is entitled is ordinarily that at which capital will seek investment in properties of similar character in that community or locality.

Shepherd vs. Northern Pacific, 184 Fed. 815.
Willcox vs. Consolidated Gas Co., 212 U. S., 19, 48.
Capital City Gaslight Co. vs. Des Moines, 72 Fed. 829.
San Diego Water Co. vs. San Diego, 118 Cal. 556; 50 Pac. 637.
Spring Valley Water Works vs. San Francisco, 124 Fed. 574.

Central of Georgia vs. Railroad Commission, 161 Fed. 925, 993.

Milwaukee Electric Railway & Light Co. vs. Milwaukee, 87 Fed. 577, 855.

(8) The presumption of reasonableness and sufficiency follows the legislative rate. Before a rate will be set aside as insufficient, it must be proven to be so beyond a reasonable doubt. The presumption of reasonableness can only be overcome by showing that the rates fixed are clearly and palpably in violation of the rights of the owners of property, and are so low as to amount to a confiscation of property through depriving it of the right to a reasonable return. The burden of proof to overcome the presumption of reasonableness is upon the complainant attacking it.

Knoxville Water Co. vs. Knoxville, 12 U. S. 1.

San Diego Land & Town Co. vs. National City, 174 U. S. 739.

(9) The value upon which a return is required to be paid is that at the time the validity at the rates sought to be enforced is in question.

Smyth vs. Ames, 171 U. S., 361, 365.

Willcox vs. Consolidated Gas Co., 212 U. S., 19, 52.

San Diego Land & Town Co. vs. National City, 174 U. S., 739, 757.

(10) Each case must depend upon its own special facts.

Wood vs. Vandalia, 231 U. S., 7.

Minnesota Rate Cases, 230 U. S., 434.

The determination of this case on the record presented involves the consideration and determination of many intricate and complex propositions. Briefly stated, the principal and general propositions, each of which will

allow of considerable separation and under each of which a number of separate questions will arise, may be stated as follows:

(1) The amount and value of the property engaged in the public service business, intrastate in Michigan.

(2) The gross income produced by that business.

(3) The operating expenses and fixed charges to be deducted from that income.

(4) The rate of return furnished by the net income upon the value of that property.

(5) Other questions are raised by the record which involve the determining of:

(a) The proportion of the property engaged in each separate class of the business done by the company; namely, passenger and freight; and the division of that engaged in each, between the interstate and intrastate business.

(b) The gross income arising upon the business of each class, together with the portion of the expenses and charges properly attributable thereto, and the net income therefrom.

As an aid to a fuller understanding of the complainant's status and its relations to the State and to the public which it serves, the following undisputed facts are specifically found:

Incorporation of Complainant, its Railroad and Financial Status.

The complainant is a consolidated railroad corporation duly created in 1887 under the laws of the State of Michigan, has its principal office in the City of Marquette in the State of Michigan, and owns, maintains, and operates lines of railroad in the State of Michigan and

Wisconsin, and, in order to reach Duluth, operates its trains thereto over a line of railroad of another company from the City of Superior, Wisconsin.

As of June 30, 1913, its system of railroad, including its main line and its branches, comprised 601.66 miles of railroad, owned by it, and about 20.83 miles of railroad over which it operated its trains under agreement with other companies, and 491.61 miles thereof are situated within the State of Michigan. Its line extends from Sault Ste. Marie, Michigan, to Duluth, Minnesota, with a branch from Soo Junction in Luce County, Michigan, to St. Ignace, and a branch from Nestoria, in Baraga County, to Houghton, in Houghton County, Michigan, and other short branches in that state.

The whole of said railroad constitutes one system, and long has been, and is now operated as such. Its cars, engines, supplies and appliances are, for the most part, used upon the system wherever required, without regard to state lines. It is impossible to operate separately with due regard to economy or the interests of the public that portion of the system of the complainant situate in any particular state. To a large extent, the trains of the complainant, both freight and passenger, necessarily move between different states, and even when their movements are confined to one state, the same trains and the same cars carry both interstate freight or passengers and intrastate freight or passengers.

Stocks and Bonds Outstanding.

As of June 30, 1913, the complainant had outstanding common stock of the par value of $12,000,000 and preferred stock of the par value of $10,000,000. It also had outstanding first mortgage five per cent bonds of the par value of $3,816,000, and consolidated four per cent mortgage bonds of the par value of $15,107,000, and

in addition covering (as a first lien thereon) its main line from Marquette to Houghton and its branch from Humboldt to Republic, Michigan, with the side tracks and other property appurtenant to such main line and branch line, and constituting about one hundred and four miles of its railroad in Michigan, six per cent mortgage bonds of the par value of $1,077,000. In addition, it had outstanding four percent income certificates of the aggregate par value of $3,000,000 and certain car trust obligations constituting a first lien on certain of its equipment and rolling stock of the par value of $398,213.19.

Book Cost of Railroad.

As of June 30, 1913, the book cost of the entire railroad and equipment of the complainant, exclusive of a reserve fund of $420,217.42, held for accrued depreciation was the sum of $46,767,309.16.

Acquisition by Complainant of Present System.

The railroads comprising the present system of the complainant were acquired by it as follows:

That portion of said railroad extending from St. Ignace to Marquette, Michigan, and which was constructed in 1880 and 1881 and was then generally known as the Detroit, Mackinaw and Marquette Railroad, was purchased from its owners in 1886 by the Mackinaw and Marquette Railroad Company which, with other railroad companies, became in 1887, by consolidation, the complainant.

That portion of the said railroad (partly constructed in 1865, in 1872 and 1883) extending from Marquette to Houghton, and commonly known as the Marquette, Houghton and Ontonagon Railroad (including the certain line of railroad from Marquette to Ishpeming, known as the Marquette and Western Railroad, constructed in

1883, and owned in the same ownership) was purchased by the complainant in 1890.

That portion of said railroad extending from Nestoria, Michigan, to Iron River, Wisconsin, was constructed by a railroad syndicate and purchased by the complainant in 1888.

That portion of said railroad extending from Iron River, Wisconsin, to Superior, Wisconsin, was constructed by the complainant in 1892, and that portion of said railroad extending from Sault Ste. Marie, Michigan, to Soo Junction, Michigan, was constructed by the complainant in 1887.

In acquiring all said railroads, the complainant only received in public lands, 82,385.29 acres, and those were acquired by conveyance from the Marquette, Houghton and Ontonagon Railroad Company. It received as a grant direct from the United States rights of way for 55 miles of its railroad lines in Michigan.

The said Marquette, Houghton and Ontonagon Railroad was bought subject to the six per cent bonds hereinafter described. The outstanding stocks and the other outstanding bonds of the complainant were issued mainly in payment for parts of said railroad and the balance were sold and the proceeds used in the construction of the remainder of the railroad of the complainant.

Entire Operation of Complainant's Railway and Its Financial Results.

From its organization in 1887 to June 30th, 1913, as well as up to the present time, the complainant has never paid any dividends on either its preferred or common stock, or otherwise made any return to the owners of the property upon their investment. For the period commencing with the incorporation of the complainant down to June 30th, 1913, the complainant, after paying

its operating expenses and taxes, has failed to earn enough to pay all the interest on all its outstanding bonds (which for the last twelve years has been $859,700 annually) and is in default on such interest to the extent of $4,624,562,47.

The results in each year of the operation of the complainant's railroad as shown by its books are specifically shown in the following statement of the operations of the complainant from the time of its organization down to June 30, 1913 (the same being Sheet 1 of Complainant's Exhibit 54 Delf.)

Complainant's Exhibit 54—Delf. (Revised by the addition of figures for the year 1913) Sheet 1

Duluth, South Shore & Atlantic Railway Company.

Complainant's Railroad Well Located, Etc.

The railroad of the complainant is well located, was built pursuant to a public demand therefor, and is honestly, economically and efficiently operated and maintained.

At least ever since the commencement of this action, said railroad has been, and is now, well equipped, reasonably well maintained, and otherwise ample for the performance of the freight and passenger service required of it; and it has been and is being maintained and operated at a standard of excellence and efficiency as to road bed, structures, equipment and service on account of its passenger traffic, which the complainant claims is higher than would be reasonably required if its business consisted only or for the most part, of freight traffic.

The several railroads now constituting complainant's railroad system were constructed in response to a public need, and if they were now obliterated, the public need for their services would justify and require their reproduction.

Original Cost Largely Unknown.

Outside of the very small parts of said railroad constructed by it, the complainant does not know, and has no means of ascertaining the original cost of its system of railroads, or of any part of the main or branch lines thereof.

Earning Power of Complainant's Railroad as Affected by Water and Railroad Competition.

The railroad of the complainant is practically in direct competition with water transportation between Sault Ste. Marie and Duluth by Lake Superior and, for a large part of the way, with railroad transportation. During all the time since the commencement of this action, and for

many years prior thereto, the complainant has been and now is, in active competition with such water and rail transportation, and during all of said times, the freight and passenger rates of the complainant have largely been influenced by water and all rail interstate competitive and commercial conditions.

Earning Power of Complainant's Railroad as Affected by Passenger Rate Legislation in Michigan.

From the year 1867, when the first statute was passed regulating passenger rates in Michigan until the year 1889, the law authorized the complainant to charge 5¢ per mile for transportation of adults within the State of Michigan. In 1889 the law was amended so as to fix the maximum charge for this railroad at 4¢ a passenger mile. In 1907, the statute was again amended to reduce the rate to 3¢ a passenger mile, and in 1911 the Legislature passed the Act complained of in this case, being Act No. 276 of the Public Acts of 1911. This Act in brief provided that for all companies, the gross earnings of whose passenger trains as reported to the Commissioner of Railroads equaled or exceeded the sum of $1,200 per mile for each mile of road operated by any such railroad company on which regular passenger service is maintained, the maximum charge should be 2¢ per mile. For children under twelve years of age, a charge of half the above fare is provided.

Said Act No. 276 was approved and became effective August 1st, 1911. The passenger earnings of the complainant as reported to the Commissioner of Railroads for the State of Michigan for the year 1906 and for each subsequent year reported, down to the present time, exceeded the sum of $1,200 per mile for each mile of railroad operated by it within the State of Michigan on which regular passenger service was maintained.

In the consideration of this case, we are met at the outset by a claim of the defendants, which, if sustainable, would be decisive of the entire case, and would obviate any necessity for considering the question of the constitutionality of the statute. That claim is that the complainants are estopped from questioning the validity of the statute by reason of the acceptance of certain land-grants made to their predecessors. This claim will now be considered.

Rights and Duties of the State and the Complainant Company Resulting from the Gift to Complainant's Predecessors of State and Federal Lands to Aid in Construction.

The claim that the complainants are estopped from questioning the constitutionality of the statute is thus sated by the defendants:

> "We believe that we have clearly established that complainant has no standing in this court, for the reason that its predecessors in ownership of parts of its roadway made valid contracts with the State by which, in consideration of the conveyance of enormous quantities of land in the Upper Peninsula, they agreed that the State would have the right and power at all times and in all matters to control them and that they should be subject to all Michigan laws.
>
> "We have conclusively shown that the complainant is bound by, and subject to the obligations of those contracts and cannot now, in direct contravention of these contracts, question the validity of Act No. 276 of 1911."

The facts out of which this claim grows are as follows: By Act of June 3, 1856, 11 U. S. Stat. at Large 21,

Congress granted certain lands to aid in the construction of certain railroads in the State of Michigan. Among the railroads provided for was one from Little Bay de Noquet to Marquette, and thence to Ontonagon. By Section 3 of that Act, it was provided,

> "That the said lands hereby granted to the said State shall be subject to the disposal of the Legislature thereof, for the purpose aforesaid (the building of railroads) and no other; and the said railroads shall be and remain public highways for the use of the government of the United States, free from toll or other charge upon the transportation of any property or troops of the United States."

By various Acts of Congress, to-wit: Joint Resolution of July 5, 1862, 12 U. S. Stat. at Large, 620; Act of June 18, 1864, 13 U. S. Stat. at Large 137; Act of March 3, 1865, 13 U. S. Stat. at Large, 420, the time for the completion of the roads provided for in the Upper Peninsula of Michigan was extended.

By Act of February 14, 1857, Laws of 1857, page 346, the Legislature of Michigan accepted the grants made by the Act of June 3, 1856, and disposed of the lands to certain railroads. Among the railroads named upon whom the land grants were conferred by the State was the Bay de Noquet & Marquette Railroad to aid in the construction of a railroad from Little Bay de Noquet to Marquette, and the Marquette & Ontonagon Ry. Co. to aid in the construction of a railroad from Marquette to Ontonagon.

By Section 5, each railroad to which lands were granted was required to accept the lands, franchises, rights, powers and privileges conferred by the Act, and to assent and agree to the provisions and requirements of the Act.

Section 8 of the Act created a commission called a Board of Control, whose duty it was to manage and dispose of such lands to aid in the construction of the aforesaid railroad, and to do any and all other acts necessary and proper respecting the construction of said railroads which shall be prescribed by law.

Section 12 of the Act was as follows:

> "All of said railroad companies shall, at all times and in all matters, be subject to the laws of this state, and to such rules and regulations as may, from time to time, be enacted and provided by the Legislature of the State of Michigan, in regard to the management and disposition of the said lands not inconsistent with the provisions of this act, and the Act of Congress making said grant of land to this State, and they shall be entitled to all the immunities and privileges conferred by said laws; Provided, that nothing herein contained shall be so construed as to relinquish the right of the State to any specific tax imposed upon any railroad company within this State."

Both these last mentioned railroads accepted the benefit of the Act, and the Bay de Noquet & Marquette constructed a line from Marquette to Ishpeming, and became entitled to about 128,000 acres, which were subsequently patented to the Marquette, Houghton and Ontonagon Railroad Company. Later, it consolidated with the Marquette and Ontonagon Railroad Company under the latter name.

The Marquette and Ontonagon Ry. Co. failed to build any part of its line or to comply with the Act of the Legislature or to earn any lands, and in consequence the Legislature of Michigan, by Act approved March 17, 1873, forfeited its grant, and conferred the lands upon

the Marquette & Ontonagon Railroad Company. Thereafter the said railway company ceased to have any interest in or connection with the land.

By joint resolution of the Legislature, March 30, 1869, it was declared that the Marquette & Ontonagon Railroad Company had failed to complete its railroad as provided in the Joint Resolution of Congress of March 20th, extending the time for such completion and that, in consequence, the Legislature was authorized to declare the land grants to said company forfeited; but it gave a further extension of time, and provided that upon the failure of the company to construct certain portions of the railroad within a certain time specified, its grant should be forfeited, and that, in that event the Board of Control was authorized to confer said grants upon some other company.

Thereafter, on April 19, 1870, said Board of Control wholly forfeited the rights of the Marquette & Ontonagon Railroad Company in its land grants for non-performance.

It thus appears clearly that, while the Marquette & Ontonagon Railway Company and the Marquette & Ontonagon Railroad Company each accepted the provisions of said Act 126 of 1857, the State annulled and canceled said grants and the contract with said roads, on the ground that the companies never complied with the said Acts and never earned the grants or any part thereof.

On the same day on which this forfeiture was declared and by the same resolution, the Board conveyed said lands to the Houghton & Ontonagon Railroad Company upon certain conditions with which said last named company did not comply. Thereafter, by joint resolution of the Legislature of Michigan, of January 24, 1871, these lands were again granted to the Houghton & Ontonagon

R. R. Co. The joint resolution making the grant contains the following language:

> "Resolved, by the Senate and House of Representatives of the State of Michigan, that the action of the Board of Control, so far as it relates to the conferring of said forfeited lands on the said Houghton & Ontonagon Railroad Company on said 19th day of April, A. D. 1870, be and the same is hereby ratified and confrmed without the conditions imposed by said Board; and be it further resolved, that the lands forfeited by said Marquette & Ontonagon Railroad Company are conferred on the said Houghton & Ontonagon Railroad Company subject only to the conditions, restrictions and requirements contained in the said Acts of Congress relating to the granting of said lands to the State of Michigan."

The Houghton & Ontonagon Company accepted the grant only upon the terms of the said resolution of January 24, 1871, and it constructed and completed a sufficient line in compliance with law to earn 153,690.27 acres which the Marquette & Ontonagon Railway Co. had failed to earn, and also to earn an additional 44,578.12 acres, all of which lands were subsequently patented to the Marquette, Houghton & Ontonagon Railroad Company.

On or about September 2, 1872, the Marquette & Ontonagon Railroad Company and the Houghton & Ontonagon R. R. Co. were consolidated under the General Railroad Laws under the name of the Marquette, Houghton & Ontonagon R. R. Co., and so consolidating under the General Railroad Laws of Michigan were undoubtedly bound thereby; yet the Houghton & Ontonagon R. R. Co. already owned the land grants in question, except those secured from the Bay de Noquet R. R. Co., free from any restrictions, terms, or obligations imposed by said Act of 1857.

The Marquette, Houghton & Ontonagon R. R. Co. thereafter earned 180,389 acres on account of its own construction from Champion to L'Anse, but these lands were granted pursuant to the joint resolution of January 24, 1871.

By Act No. 197 of the Session Laws of 1875, the Legislature appropriated five sections per mile of its own swamp lands to aid in the construction of a line from the village of L'Anse to the Village of Houghton. The Act conferred power and authority upon the Board of Control of the State Swamp Lands to grant the lands to a railroad company and to prescribe the conditions of the grant, and a contract was entered into with the Houghton & L'Anse R. R. Co., a Michigan corporation, for the construction of this road, which was constructed, and thereby the railroad company earned 82,421.62 acres of State Swamp Lands. This act placed no obligation upon the constructing company other than to build the road. Only by inference was it required to operate it when constructed.

The Detroit, Mackinaw & Marquette Grant.

By Act No. 36 of the Session Laws of Michigan of 1873, an appropriation of the State Swamp Lands not to exceed 10 sections per mile, was made to aid in the construction of a railroad from the Straits of Mackinaw to Marquette. This road was to be completed before December 31, 1875. These lands were State Swamp Lands theretofore granted by the Federal Government to the State.

The granting act placed no obligation upon the constructing company except to construct the road and by inference to operate it. Unable to obtain the construction of the road under this Act, the Legislature passed subsequent Acts from time to time enlarging the grant and extending the time for construction, until finally the lands

were granted to, earned by, and patented to the Detroit, Mackinac & Marquette Company in March and April, 1883. This railroad was sold under foreclosure on October 20, 1886, and was purchased by Hugh McMillan and conveyed to him by deed recorded December 20, 1886. McMillan conveyed to the Mackinaw & Marquette R. R. Co., a Michigan corporation, which latter company, with certain other railroad companies, by consolidation in 1887, under the General Railroad Laws of the State, became the complainant.

The lands patented to the Detroit, Mackinac & Marquette Ry. Co. had been separately mortgaged. Neither the complainant nor its grantors ever had or acquired any interest in these lands.

The portion of the complainant's railroad from Nestoria to Iron River, Wisconsin, was constructed by a railroad syndicate and purchased by the complainant in 1888, and it never had the benefit of any land grant.

That portion of complainant's railroad originally known as the Marquette & Western Railroad, and extending from Marquette to Ishpeming, was constructed without the aid of any land grant.

That portion of the complainant's railroad extending from Soo Junction to Sault Ste. Marie was constructed without the aid of any land grant.

That portion of the complainant's railroad extending from Marquette to Houghton, and commonly known as the Marquette-Houghton & Ontonagon R. R. Co., including the additional line from Marquette to Ishpeming, known as the Marquette & Western Railroad, was purchased by complainant in 1890, and conveyed by deed of conveyance to the complainant.

None of the public lands conveyed by the said Federal Land Grants, and patented to the Marquette, Houghton & Ontonagon R. R. Co. ever passed to the complainant.

In acquiring all of said railroads the complainant only received the 82,385.29 acres of swamp lands originally earned in the construction of the Houghton & L'Anse Railroad. No part of the swamp lands granted in aid of the Detroit, Mackinac & Marquette Railroad ever came to the complainant, directly or indirectly.

The argument of the defendants in support of their contention is based upon the provisions of Sec. 12 of the Act of Michigan of 1857, above quoted. The line of reasoning is that before the Act was passed, all railroad companies were subject to the existing laws of the State and of the United States, and to such changes in these laws as do not infringe constitutional limitations; that in the declaration of Sec. 12, that "all of said railroad companies shall at all times and in all matters be subject to the laws of this State", the word "laws" must conclusively be presumed to have meant more than merely constitutional laws, because, otherwise, the provision would be useless; also that it cannot be "referred only to valid and constitutional laws, and thus to the laws allowing sufficient return from rates charged," but must go farther, because it must be construed most favorably to the public.

It is obvious that this contention goes to the extent of claiming that the land grant referred to and its acceptance constituted an agreement under which the Legislature had the power to fix uncompensatory rates, both freight and passenger, at its will and that the exercise of such power would be a benefit to the public.

I am unable to agree with this construction of the statute. The effect of such construction would be to hold that the Legislature, although it had granted these lands to aid in the construction of these railroads, might, by fixing uncompensatory rates, both freight and passenger, effectually take away the property which it had granted

and so defeat the very purpose which both the State and the United States had in causing these roads to be constructed. The Complainants ask me to find that such a construction would be inconsistent with the purpose expressed by Congress in the Act granting the lands, viz: "that these railroads should be and remain public highways for the use of the government of the United States" and also to find that if the Legislature had the intention claimed by the defendants in the adoption of Sec. 12, the section would be void as a contract made in favor of the State of Michigan in violation of its duties as trustee, and any acceptance of it by a railroad company void, as against public policy, and I so find.

Upon the question whether such contract was entered into, I find that it was not. I cannot believe that it was contemplated or intended by either of the parties in interest. To my mind, it is unbelievable that the parties accepting the land grant did so with the uderstanding that their property was to be placed so completely under the control of the Legislature as it would be under such an agreement. It is not believable that owners of capital available for railway investment would, as a business proposition, thus part with the control of their capital or property.

And it is equally unbelievable that the Legislature intended to so frame its railroad laws as to place such a ban upon railway investments in the State as would result from thus making the stocks and bonds of these Michigan railroads unsalable in the world's markets. It is to be presumed always that in the enactment of every law the Legislature intends to benefit the State, but such a law would not only not benefit the State but would be a distinct injury, and this fact should be considered in seeking the legislative intent, for although it is not competent for the judiciary to review the judgment of the Legisla-

ture upon questions of public policy, and refuse enforcement of a law on the ground that it would be an injury to the State and the public, it is competent and proper, in the interpretation of Statutes for the Courts to consider the results that would inevitably or probably follow from any proposed interpretation—such consideration being not for the purpose of nullifying the legislative intent by judicial vote of an undesirable statute, but for the purpose of discovering and effectuating the real intention and purpose of the statute. The fact that the interpretation claimed by defendant would be injurious to the State tends strongly to show that the Legislature did not so intend, and the question whether they did so intend is all that concerns us here. It is true that in the interpretation of a statute effect should as a rule be given to all the language of the statute, but the rule is not inflexible and does not demand interpretation beyond the necessities of the case under discussion. In this case, it is not necessarily incumbent upon us to find something upon which the language in question could effectually operate, or to find what the Legislature actually intended by the language used; our only concern is to determine whether the legislature intended by this language to impose the condition in question.

If we fail to find that the Legislature so intended, it is of no consequence to us in this case what their intention was in using the language in question. Did they so intend? The claim that they did so is based wholly on the language in question, but I am unable to find in that language anything which would justify the inference of such intention. On the contrary, so far from indicating such intention, the language employed seems to me to be incompatible with the existence of such intention. If the Legislature had such intention, it was their duty to express it clearly and unequivocally. Nowhere are clear-

ness and accuracy of expression more imperatively demanded than in Legislative enactments. The construction claimed by defendants would involve, it seems to me, an unbelievable dereliction of duty in this regard. According to that claim, the idea that the Legislature had in mind and there intended to express could, and would have been clearly, accurately and easily expressed, had they made in the statute the following provision: "In consideration of the lands hereby granted, the companies receiving the same agree to accept and abide by any freight tariff or passenger fare which the Legislature may provide, and thereby waive any and all rights which they would otherwise have under the Constitution to question the validity or legality of such rates on the ground that they are confiscatory of the company's property."

Now, if this was what the Legislature intended, why did they not say so? Why did they choose, rather, to cloak their intention in ambiguous, enigmatical, and misleading language? I can see no possible reason for such choice. If they had desired to impose the condition covertly and entrap unwary investors, the choice would have been a good one—a prospective investor would not have suspected that this innocent looking provision covered such a pitfall—but that the Legislature had any such motive is a supposition that cannot be entertained for a moment. On the contrary, we must assume that the Legislature sought diligently to avoid forms of expression that would be ambiguous and misleading, and this assumption, it seems to me, precludes any inference that the Legislature had the intention claimed by defendants.

To sum up:—in view of these three considerations, viz:

(1) that it would involve a breach of trust;

(2) that it would be detrimental to the interests of the State; and

(3) that it involves the assumption that the Legislature having a certain intention which could readily have been clearly and accurately expressed, and being under solemn obligation to so express it, deliberately chose not to so express it, but employed, instead, a form of expression which was obscure, uncertain and misleading—in view of these considerations, I say, I find it impossible to believe that the Legislature intended to impose the contion in question; and therefore that the complainants are not estopped from questioning the legality of the prescribed rate.

If, however, I am wrong in this conclusion—if the complainants are, as regards any part of its railroad, estopped by the acceptance of land grants from questioning the legality of the prescribed rate, I find upon the facts hereinbefore stated that such estoppel applies to only a part of their railroad; that Sec. 12 above discussed is applicable only to the twenty(20) miles of railroad constructed by the Bay de Norquet & Marquette Company, as the companies constructing the remainder of the roads receiving the grant therefor expressly took the grant "subject only to the conditions, restrictions and requirements contained in the Acts of Congress relating to the granting of said lands to the State of Michigan."

Having found that the complainants are not estopped from questioning the validity of the prescribed rate, we come to the main question: Is the statute confiscatory?

As the law is well settled that a statutory rate is not confiscatory if it will yield a fair return upon the value of the property employed in earning the rate, and conversely, it is confiscatory if it will not yield such return, the precise question to be determined here is, whether the rate in question will yield such return.

Upon this question, the complainants allege that the rate will not, and the defendants allege that it will yield

such return; and a very great amount of testimony has been taken in support of the respective contentions.

In considering the effect to be given to this testimony certain questions have arisen as to the burden of proof and its requirements in this case which require to be determined preliminarily to the consideration of the effect of the testimony on the main issue. On this subject, the defendants claim that the presumption in favor of the constitutionality is of a very strong character requiring a very high degree of proof to overcome it, and that it extends not only to the main questions at issue, but to every subordinate question that may arise and requires everywhere the same degree of proof as on the main question. As this claim is very strongly urged and relied on by the defendants, and as it affects the consideration of every question in the case, it is desirable to consider carefully in advance the burden of proof in this case and its requirements.

The Burden of Proof and Its Requirements in This Case.

That the burden of proof rests upon the complainants in this case, and requires them to prove affirmatively that the statute in question is unconstitutional, no question is raised, but as to the precise degree of proof required to discharge that burden, there is much question and controversy, the claims of the respective parties in that regard being very conflicting.

The complainants claim that the burden of proof resting on them is dischraged if "upon the whole proof the Court has a conviction reasonably free from doubt." And that "there is no single fact necessary for complainants to prove which may not be established by a fair preponderance of the evidence precisely as such fact may be established in any other civil action." The defendants claim, on the other hand, that the complainants'

proofs must go much further. They make, in this regard, two distinct claims; first, the extreme claim that the complainants must prove every material fact involved, "beyond the possibility of a doubt"; and second, the more moderate claim that complainants are required to prove every material fact beyond a reasonable doubt—substantially as the fact of guilt is required to be proven in criminal cases.

As the questions raised by these conflicting claims relate to rules which may affect the decision of every question of fact arising in the case, it is necessary to consider these questions of law before proceeding to consider the questions of fact to which they are to be applied.

Taking up those conflicting claims in the order of their mention, I find the complainants' is untenable. It is well settled that every legislative enactment is presumed to be constitutional until the contrary is proved, and this presumption in favor of the statute in question here the complainants must meet and overcome by proofs. Now, if there were no such presumption as this, the complainants would still be required to prove "every single fact" by a preponderance of evidence, so that, if their contention on this point were sustained, the presumption in favor of the validity of the statute would practically have no effect in the case. As it will not do to admit the existence of the presumption and at the same time deny that it has any effect, the complainants must do more than produce a mere preponderance of evidence in proof of essential facts, and the question, therefore, is how much more must they do?

The general answer to this question is well settled; and it is that they must prove their contention beyond a reasonable doubt. It has been so held in a long line of cases, including the well known one of Ogden vs. Saunders, 12 Wheat. 220, and has been uniformly recognized

by text writers; but as to what particular facts must be so proved there is much room for question.

As regards the defendants' claims the first, viz, that complainants must prove every material fact beyond the possibility of a doubt, I find untenable. It not only conflicts with the rule of reasonable doubt, above mentioned, but it would, if allowed, render it practically impossible to prove the unconstitutionality of any rate law, for in all such cases, the proof is, and in the nature of things must be, based largely upon estimates or opinion-evidence, and in such evidence there is always the possibility of a doubt.

The claim of the defendants appears to be based entirely upon the following language found in the decision in the Minnesota rate case:

> "Doubtless there may be cases where the facts would show confiscation so convincingly in any event after full allowance for possible errors in computation as to make negligible questions arising from the use of particular methods."

I can see nothing in this language that indicates any intention on the part of the Court of thereby laying down any rule of evidence, much less a rule so drastic and so inconsistent with the general rule above mentioned, and with the general purpose of all judicial evidence.

So far from evincing such intention, the Court, in that very case, did not require the complainants to prove their contention beyond the possibility of a doubt—but only beyond a reasonable doubt in accordance with the general rule above mentioned.

That that rule—the general rule of reasonable doubt—must govern in cases involving the constitutionality of a statute there seems to be no uncertaintly or room for question. But upon certain questions arising in the prac-

tical application of the rule, there is much question and considerable uncertainty.

The defendants claim that in order to satisfy the rule and prove beyond a reasonable doubt that the statute is invalid as against the complainants it is necessary to prove beyond a reasonable doubt every material fact averred in their complaint—that the presumption of constitutionality extends both to the main question as to whether the statute is confiscatory and also to every subordinate question involved in the determination of the main question; and that, in order to overcome the presumption as to any subordinate question, the same degree of proof is required as is required in regard to the main question.

As this claim is strenuously urged, and largely relied on to defeat the complainants' action, and as the defendants are entitled to whatever benefit the presumption of constitutionality affords, it is necessary to inquire into the precise nature and extent of the presumption in favor of the constitutionality of every legislative enactment, and the reason on which it is based. Wherever that reason exists, the presumption applies and must be overcome. What is that reason? Why is it that the judiciary, although it finds by a preponderance of evidence in a given case that a statute is unconsitutional, refused, nevertheless, to nullify the statute until the proof of its unconstitutionality goes farther and removes all reasonable doubt.

The answer to this question cannot be better stated that in the language of Mr. Justice Cooley, found on page 183 of his Constitutional Limitations, as follows:

> "The constitutionality of a law is to be presumed because the Legislature which was first required to pass upon the question acting as they must be deemed to have acted with integrity and with a great desire

> to keep within the restrictions laid by the Constitution upon their action, have adjudged that it is so. They are a co-ordinate department of the Government, with the judiciary, invested with very high and responsible duties as to some of which their acts are not subject to judicial scrutiny and they legislate under the solemnity of an official oath which it is not to be supposed they will disregard. It must, therefore, be supposed that their own doubts of the constitutionality of their action have been deliberately solved in its favor so that the courts may, with some confidence, repose upon their conclusion as one based upon their best judgment."

It thus appears that the reason of the rule is that since it is the duty of the Legislature before enacting a law to consider carefully the question of constitutionality and become satisfied beyond reasonable doubt that the proposed law is constitutional, it must be presumed that they performed that duty and adjudged the law to be constitutional, and that a due respect for that judgment requires the judiciary to refrain from passing a contrary judgment until they are, in like manner, satisfied beyond reasonable doubt that the law is unconstitutional.

That such is the reason of the rule has been uniformly laid down and has never been questioned. In the early case of Ogden vs. Sanders (12 Wheat. 270), the Court, per Washington, J., says:

> "It is but a decent respect due to the wisdom, the integrity, and the patriotism of the legislative body by which any law is passed to presume in favor of its validity until its violation of the constitution is proved beyond all reasonable doubt. This has always been the language of this court when that subject has called for its decision."

The principle thus uniformly laid down, it should be noted, is confined to legislative judgments on the question of constitutionality. As thus enunciated, it does not extend to legislative judgments upon other questions. In order, therefore, to make the principle applicable to other questions, it must appear or be presumed, not only that the Legislature passed judgment upon such other questions, but that each and every of the judgments thus passed upon such questions was a necessary part of the judgment upon the main question of constitutionality.

In this case, it does not affirmatively appear that the Legislature passed judgment upon any of the questions involved. The question, therefore, what particular legislative judgments are to be respected here, is wholly one of presumptions. What questions are we here required to presume that the Legislature adjudged? Certainly the main question that the law was constitutional; and the contention of the defendants is that this presumption as to the main question necessarily carries with it the further presumption that the Legislature, in judging the main question, adjudged also all of the questions subordinate thereto (which means all the material questions in the case) and that all such presumed further judgments are entitled to the same degree of respect as the judgment upon the main question, and can be overcome only by the same degree of proof as is required to overcome the latter. Are we required to make these two presumptions? In the first place, must we presume that the Legislature, in adjudging the main question of constitutionality adjudged all of the questions subordinate to that main question that have arisen in this case? We clearly are not unless we must presume that the Legislature in judging the question of constitutionality employed exactly the same method as we are employing in this case. Must we so presume? What method the Legislature did, in fact,

employ does not affirmatively appear. There is nothing outside the law itself that tends to show what method was employed, but there is a provision in the law which does so tend, namely the provision that limits the application of the two (2) cent rate to those roads whose gross passenger earnings equal or exceed twelve hundred dollars ($1,200) per mile, and prescribes a higher rate for those roads whose gross passenger earnings fall below that amount.

This provision, though not directed expressly to the subject of constitutionality, is very significant in that connection, and must be given due consideration. It must be presumed that the Legislature, in making this provision, was seeking to prescribe for each of the two classes of roads, thus provided for, a rate that would be fair to the public and also both fair and constitutional as applied to the various roads; and from this it must also be presumed that the Legislature adjudged that as to all roads whose gross passenger earnings equaled or exceeded twelve hundred dollars ($1,200) per mile, the two (2) cent rate was constitutional.

Now, in what way are we to presume the Legislature reached this conclusion? It must be in one or the other of two ways, viz., either first that the legislative judgment of constitutionality was predicated entirely on the amount of gross earnings or else, second, that the Legislature determined the question of constitutionality in the same way that it is being determined here, and having thus reached its conclusion on that question, found in some way a connection between that conclusion and gross earnings of twelve hundred dollars ($1,200) per mile of such character that it adopted such gross earnings as the test by which to determine the applicability of the rate to any particular road.

As to the first of these alternative presumptions—it is

clear that it cannot be made. Such a presumption would imply that the Legislature found that there was such a necessary relationship between gross earnings on the one hand and net earnings and value of property employed on the other hand that the rate of return upon the value of property employed could be determined from gross earnings alone without determining the net earnings or value of property employed. As such a presumption would be absurd, it is the alternative presumption if any that must be adopted. Can we make this alternative presumption, viz., that the Legislature employed the method which is being employed here? In order to make such presumption, we must assume that the Legislature performed a colossal task; we must assume that preliminarily to the enactment of this law, the Legislature determined the value of the property of every railroad in the State and also its gross and net earnings and the rate of return upon property value to which each was entitled; and that, having determined all these things it further determined with reference to every road what portion of its property was employed in its passenger service and its gross and net passenger earnings; and from the presumption that it determined all these things we should have to presume further that the Legislature adjudged all the questions that would be involved in making those determinations which would, of course, be all the questions involved in this case.

Now, does a due respect for the presumed legislative judgement of constitutionality require the judiciary to make a presumption that is so manifestly impossible? I think not. And if it does not, then we cannot presume that the Legislature employed this method of determining the question of constitutionality, and therefore cannot presume that it adjudged the questions arising in this case which are subordinate to the question of constitu-

tionality; and therefore need not require proof beyond a reasonable doubt upon those questions on the ground that they have been adjudged by the Legislature. The only legislative judgment, therefore, that is to be presumed here, and out of respect to which proof beyond reasonable doubt is required, is the judgment on the main question that the law was constitutional.

This, however, is not entirely decisive of the question under immediate consideration. It does not follow therefrom that none of the subordinate questions are required to be proven beyond reasonable doubt. The defendants do not admit that their contention involves the necessity of presuming a legislative judgment upon the subordinate questions, but claim that regardless of whether such judgment is or is not to be presumed, the presumption of constitutionality applicable to the main question in and of itself casts upon the complainants the burden of proving beyond reasonable doubt the conclusion sought to be drawn by them upon each and every of the subordinate questions involved. In support of this contention, they argue that since a chain is no stronger than its weakest link, in order to conclude beyond reasonable doubt that the law is unconstitutional, every link in the chain of reasoning by which that conclusion is reached must itself be established beyond reasonable doubt and therefore that the conclusion claimed by complainants upon every question involved must be so established.

This argument is plausible, but it involves unwarranted assumptions. It involves the assumption that the conclusion which is drawn on the question of constitutionality is necessarily the last link in a chain of reasoning in which the conclusion on every material question involved in this case is a necessary link. Such assumption is unwarranted because the final conclusion on the question of constitutionality is not necessarily reached

by means of such a supposed logical chain nor is it invariably necessary in reaching such final conclusion to draw any particular conclusion on any one of the subordinate questions involved.

The final conclusion on the question of constitutionality is not necessarily or usually the last link in such a supposed chain of reasoning, but is, instead, the summing up of, and the striking of a balance between, two conflicting classes of reasons, viz., those which tend to show the constitutionality of the law and those which tend to show its unconstitutionality—those reasons consisting of the applicable rules of law and the facts and conditions proven to the court or cognizable by the court without proof and also the conclusion drawn upon the various subordinate questions involved. Of those minor conclusions some may and some may not be of such vital importance in the decision of the applicable rules of law and the facts and conditions proven to the court or cognizable by the court without proof and also the conclusion drawn upon the various subordinate questions involved. Of those minor conclusions some may and some may not be of such vital importance in the decision of the main question that in order to reach the main conclusion beyond reasonable doubt it is necessary that the minor conclusion also be established beyond reasonable doubt, but seldom, if ever, would all or many of the minor conclusions require to be so established; and whether any of them would, in any particular case, require to be so proven, and if so, what ones are questions to be decided in every instance by the tribunal whose duty it is to weigh all the evidence and draw the final conclusion upon the question of constitutionality as the same is presented in that particular case. And that tribunal in drawing such conclusion is not, in my judgment, required by any rule of law or logic to refuse to consider and give weight to

any conclusion that is supported only by a preponderance of evidence, upon the ground that it has not been established beyond reasonable doubt. The fact that such conclusion is not established beyond reasonable doubt, but is supported only by a preponderance of evidence is something that must be considered and it may be of such vital importance to the main issue as to forbid a conclusion on that issue that would be otherwise drawn; but whether it is or is not of such importance is for the court to decide, unfettered by any hard and fast rule on the subject. That this is true as regards the multitude of subordinate questions involved in the case is quite evident and that it is in a measure true as regards even the three main questions appears from a moment's consideration of conditions that might occur. Thus, if the value of the property were proven only by a preponderance of evidence and the expected return were proven beyond a rasonable doubt to be such as would not pay a fair return on more than one-half the amount which it appears from a preponderance of evidence the property was fairly worth would it not be clearly competent for the court to consider the general effect of all the evidence and to conclude that the evidence on the whole showed beyond reasonable doubt that the rate in question would not yield a fair return on the value of the property? According to the defendant's contention, it would not. Their contention is that the rule here invoked by them is a hard and fast rule of law which forbids the court from adjudging this law unconstitutional unless and until the complainants' contention on every question involved in the case has been established beyond reasonable doubt. This contention is based, it seems to me, on a fundamental misconception of the nature of the rule of reasonable doubt on constitutional questions. In my judgment, there neither is nor can be any such rule of law on the subject.

A rule of law binding on the courts must have a legal sanction either in legislative enactment or in established usage. The rule in question neither has nor can have either of these sanctions. It cannot derive a sanction from established usage because it originates with the courts and is grounded not upon usage but upon a judicial sanction that has and can have no reference to usage, and it cannot derive a sanction from legislative enactment for the same reason, viz., that it is a creature of the courts existing without and independent of any authority derived from legislative enactment.

It derives its sanction from the power of the judiciary to nullify legislation on constitutional grounds—a power that is derived by the judiciary directly from the constitution and which therefore is and must be wholly independent of legislative control. If its exercise could be controlled by legislative enactments requiring the judiciary to exact certain proofs or certain degrees of proof before declaring any legislative act unconstitutional it could be practically nullified or destroyed by legislative action, whereas it is a power which by its very nature is and must be beyond the reach of legislative authority. This power thus derived from the constitution necessarily includes the power to make regulations as to the means and methods of its exercise, and it is in the exercise of the power to make such regulations that the rule of reasonable doubt has been prescribed. It is, then, a rule of procedure or adjective law as distinguished from a rule of substantive law, and as such is, like other rules of procedure, within the control of the courts, and not a rule the enforcement of which a litigant may demand as a matter of right. It is not a rule of private right but of public policy—a rule of inter-departmental comity. Its enforcement by the courts is a duty which

the judiciary owes not to any private party asserting rights under the law in question, but to a co-ordinate branch of the government of which the judiciary is a part —the branch that enacted the law. It is a reciprocal duty reciprocating with a duty which the Legislature owes to the judiciary. It is the duty of the Legislature on the one hand to enact laws that are constitutional and to refrain from enacting those that are unconstitutional, i. e. to refrain from calling on the judiciary to administer and enforce unconstitutional laws, and it is the duty of the judiciary on the other hand to enforce all laws that are constitutional and to refrain from enforcing those that are unconstitutional and the latter duty is no less imperative than the former. As all laws are mandates to the courts the Legislature when it enacts an unconstitutional law thereby not only itself violates the constitution but also calls upon the courts to do likewise. The enforcement of an unconstitutional law would be in itself a violation of the constitution by the judiciary at the behest of the Legislature. This the judiciary will not do; but before refusing to do so it will exercise special care in determining whether the law is or is not unconstitutional. What degree of care it will so exercise is wholly a question of the respect due from the judiciary to the judgment presumed to have been pronounced by the Legislature that the law was constitutional; that is to say it is a question of public policy relating to the proper maintenance of the balance of governmental functions designed to be secured by the tripartate partition of powers established by the constitution, and not at all a question of private right between the parties. As a measure of conservatism and a method of exercising special care in determining the question of constitutionality the judiciary has imposed upon itself the restraint of this rule of reasonable doubt. Now the adoption of this rule clearly confers on

litigants no rights that they would not otherwise have had. It affords a litigant no standing from which to demand an enforcement of the rule as matter of private right for him. Its enforcement may benefit him but if so such benefit is merely incidental to the public benefit which constitutes the purpose of the rule, he may argue as vehemently as he wishes for the enforcement of the rule, but his arguments can have weight only as they are based upon considerations of benefit to the public and not of benefit to him.

From the foregoing conclusions, it seems to me very clear that there neither is nor can be any rule of law by which the courts are bound to require proof beyond a reasonable doubt upon all or any of the subordinate questions arising in this case.

But it does not follow from this that such proof will not be required—does not follow that the rule of reasonable doubt will not be applied to any subordinate questions—it merely results that subordinate questions may or may not require to be proven beyond reasonable doubt and it leaves the question open whether any and if so what subordinate questions require to be so proven. And as this open question can be determined only in the final summing up on the main question it results in leaving the complaining party at his peril to prove beyond reasonable doubt all such subordinate questions as are liable to require to be so proven in order to establish his contention on the main question of constitutionality beyond reasonable doubt.

And when all the proofs both pro and con have been made it devolves upon the Master to deal with this open question as to the applications of this rule of reasonable doubt to subordinate questions. What is his duty with regard to that question and how is it to be performed? It is his duty to determine whether the fact of unconstitu-

tionality has been established beyond reasonable doubt, and in the performance of this duty he is required to make specific findings upon all the questions involved, and in doing so, he must apply the rule of reasonable doubt not only to the main question but also to all such subordinate questions as must be established beyond reasonable doubt in order to so establish the main question. But as he cannot know in advance of his final summing up what ones of the subordinate questions will require to be so proven, how is he, in making his specific findings on subordinate questions to determine whether his finding upon that question must be established beyond reasonable doubt or only requires to be established by preponderance of evidence and therefore whether the rule of reasonable doubt is to be applied to that question? The answer to this question, I conceive to be this, that inasmuch as some of the subordinate questions will probably require to be established beyond reasonable doubt, and all of them may possibly so require, and as his findings are subject to review, it is the duty of the Master in making his specific findings to supply the rule of reasonable doubt to all material questions and if in any instance his finding is based not on proof beyond reasonable doubt but on a preponderance of evidence merely it is his duty to so state. This will properly preserve the rights of both parties, as it will give to the defendants the full benefit of the presumption of constitutionality and to the complainants the full benefit of their proofs and at the same time it will apprise the court specifically of all the steps by which the Master's final conclusion has been reached. Such is the course that will be followed by me in determining the main question whether the unconstitutionality of the prescribed rate has been established beyond reasonable doubt, and it will therefore be understood that, except where it is otherwise expressly stated, all the con-

clusions arrived at herein have been found by me to have been established beyond reasonable doubt.

I have discussed the subject of this presumption thus at length because the defendants insist strenuously that it applies to every one of the multitude of questions arising in the case and in numerous instances, claim from it most important results, even such results as would, in some instances, be decisive of the case, and in others would prevent freedom of inquiry and judgment. Thus, for example, on the question of net earnings to be anticipated under the 2¢ rate, they claim that we must presume that the Legislature adjudged that the decrease in rate would produce an increase in volume of traffic so great that there would be no decrease in net earnings resulting from the decrease in rate and that that judgment must be presumed to be correct unless the complainants prove by affirmative evidence and beyond a reasonable doubt that such resulting increase in volume of traffic would not be great enough to have that effect. As such affirmative proof is impossible, and as the statute could, by no possibility be confiscatory if it caused no decrease in net earnings, the presumption of constitutionality thus applied would be decisive of the case.

Again, on the subject of valuation, the defendants claim that where estimates of value disagree, this presumption requires that we must always accept that lowest one because the fact that somebody so estimates the value creates a doubt of the correctness of every other estimate and as every doubt must be resolved in favor of the statute, the lowest estimate must be accepted as the true value—a doctrine which would preclude freedom of judgment.

To the foregoing findings with reference to the burden of proof defendants' objection No. 2 is addressed. The objection is that I have committed error

"upon the question of the degree of positiveness of proof required, of those contesting a statutory rate of fare, to establish the invalidity of such rate, and in not finding that it is essential that every material question and conclusion, upon which the invalidity of a statutory rate is predicated, be established beyond controversy and beyond the possibility of a reasonable doubt, as well as in numerous instances throughout the report failing to apply the rule that every question throughout the controversy of sufficient materiality and importance, taken separately or cumulatively, as to affect the result, must be resolved in favor of the validity of the rate-fixing statute."

It is further stated that the applicable principle has been enunciated in many cases.

"It is that every presumption is to be resolved in favor of the validity of legislative enactments; and rate-fixing statutes form no exception. The effect of this salutary rule has never been permitted to be frittered away by nice distinctions or refinements of reasoning, as is here attempted.

No discretion is vested in the courts in determining whether the Legislature, as a co-ordinate branch of the Government, has exceeded its authority. When positive proof of the exercise of excess authority is produced, then, and then only, can the courts perform their duty of declaring statutes to be unconstitutional. Before that duty arises, or will be performed, it must appear beyond possibility of reasonable doubt that the statute is unconstitutional, and, in order that it may so appear, it must also appear that *every link in the chain of evidence* to show such invalidity is established beyond doubt. Such invalidity is not permitted to rest upon equivoca-

tion or opinion, and where there is doubt on any question or element, that doubt must be resolved to sustain the legislative action. We feel that in a number of instances throughout the case the doubt has not been resolved by the Master in favor of the validity of the statute, but has been resolved in favor of the complainant. A few of the particulars which may be pointed out are the following:

> In allowances for the items "Contingencies," "Taxes," "Appreciation," "Working Capital" and "Stores and Supplies."
>
> In refusing to depreciate ballast and track laying and surfacing.
>
> In acceptance of complainant's alterations of defendants' modified revenue train-mile ratio for division of common property and common expenses.
>
> In the determination that decreased rates will not, and did not subsequent to 1907, produce increased traffic."

The presumption referred to in this objection has been quite fully discussed by me in connection with the findings to which the objection relates, but it has been so strongly urged at all points by defendants, and so implicitly relied upon in many instances as an insuperable defense to the complainant's case, that some further discussion of it here may be desirable. At a great many points in the case, the presumption has been brought forward in a way which, if sustained, would end the case at once.

In considering this objection, the first thing to be noted is that it misapprehends my findings both as regards the principle of law applicable to this subject, and also as

regards my application of that principle in determining questions of fact.

With regard to my findings as to the principle of law involved, the fact is that I have fully adopted the doctrine contended for by the defendants, except that I do not adopt their extreme claim that all material facts must be proved beyond the possibility of a doubt.

As regards the principle of law here involved, therefore, the only question to which this objection can apply is whether the defendants are right in this extreme contention. Upon this question I see no reason for changing the views already expressed. I can find no authority in precedent or foundation in reason for this extreme doctrine. I am unable to find in the numerous cases cited by defendants in this connection any support for such dictrine or any intention to give any other or greater effect to the presumption in question than is given to it by me in my findings. And I am equally unable to find any foundation in reason for such doctrine. To my mind it would be irrational for any court of justice, and especially for a court of equity, to adopt and apply a rule that it would refuse relief unless the facts calling for relief were proven beyond the possibility of a doubt, and still more especially where those facts were in their very nature non-susceptible of such proof. In fact, the application of such a principle or rule to human affairs is inconceivable. Outside the domain of mathematics, there is no such thing as proof beyond the possibility of a doubt. A rule to suspend action until all possibility of doubt regarding it and its effects had been removed, would arrest and paralyze every form of human activity.

Disallowing, therefore, this objection, insofar as it reasserts this extreme doctrine, I pass to the consideration of that part of the objection which relates to my applica-

tion of the principle of reasonable doubt as adopted by me.

The assertion involved in this part of the objection, that in reaching my conclusions I have, in numerous instances, resolved doubts in favor of complainant and against the defendants, is a mistake. In reaching my conclusion, I invariably resolved my doubts in favor of the defendants, and reached no conclusion until I was satisfied, beyond a reasonable doubt, that the conclusion was correct. The mistake thus involved in this objection arises, as it seems to me, from two distinct misconceptions of the nature of that which is designated by the word "doubt" in the phrase "reasonable doubt", either of which misconceptions would render the presumption in favor of the validity of legislative action an indisputable presumption in fact, although the defendants recognize it in theory as a disputable presumption.

The first of these misconceptions is in conceiving a reasonable doubt to be something which exists extraneously to, and independently of, any individual mind, and which, like a problem in mathematics, has one and only one correct solution for all minds, whereas the fact is that that which is there designated by the word "doubt" is an individual state of mind—a state of mind in which the individual having the doubt is hesitating to accept a certain conclusion because he is not entirely certain of the existence of all the facts or the soundness of all the inferences required in order to justify the conclusion contemplated. It is to this state of mind that the rule in question applies when the proposed conclusion is in favor of complainant, and it there requires that the proposed conclusion be not accepted until all such uncertainty is removed, even though the preponderance of evidence is in favor of the conclusion. Resolving all doubts in favor of the defendants means refusing to accept such con-

clusion so long as there remains any reasonable doubt of its correctness—that is to say, any doubt having a good foundation in reason.

Now, whether such doubt exists, and if so, against what evidence to the contrary it will continue to exist, is of necessity a question to be decided by the particular individual mind which is asked to draw the conclusion.

In deciding the question, it is of necessity his doubts, and not the doubts of somebody else, that he is to resolve in favor of the defendants, and it is of necessity he alone that can say how his doubts have been resolved. If he accepts the conclusion that fact gives no ground for saying that he has violated the rule and resolved his doubts in favor of the complainant. Nevertheless, the defendants here assert that in numerous instances I resolved my doubts in favor of the complainant with no other apparent foundation for the assertion than the fact that I accepted a certain conclusion. In doing so, they make the mistake of failing to recognize the individual character of doubt and of assuming that wherever a person reaches a conclusion different from that contended for by them, he has thereby necessarily resolved his doubts in favor of the complainant. And in doing so, they necessarily take the position that no conclusion different from that contended for by them can be reached in this case without violating the rule requiring all reasonable doubt to be resolved in their favor.

This is why I have said that their misconception of the nature of doubt, as that word is here used, is one of two misconceptions, either of which would render the presumption in favor of the validity of legislative action an indisputable presumption.

The other misconception as to the nature of reasonable doubt, as those words are used in a rate case, is that they conceive of doubt as being practically synonymous with

uncertainty; that wherever there is uncertainty of any kind or degree, there is also reasonable doubt, and that therefore, so long as there is any uncertainty, there can be no conclusion in favor of the complainant. Now, as the principal questions in a rate case always involve certain kinds and degrees of uncertainty, which cannot be eliminated, this conception of the nature of a reasonable doubt, it will be seen at once would, like the other, render the presumption indisputable.

That the defendants' position is that the presumption is in fact indisputable is further shown in their treatment of the principle adopted by me for weighing the presumption against opposing evidence. In this regard, I expected, and assumed, that they would recognize the necessity of adopting some principle for this purpose, and either accept the principle applied by me, or else point out its defects and state what they conceive to be the true principle. But they do neither, nor do they refer in any way to the principle applied by me, except by necessary inference to characterize it as involving equivocation, and as an attempt to fritter away the salutary effects of the presumption by nice distinctions or refinements of reasoning. No other conclusion can be drawn from their comments in this connection than that the defendants consider that there is, and can be, no such thing as weighing the effect of the presumption against opposing evidence and that any attempt to do so is anathema and a failure of due respect for the sanctity of the presumption.

That the defendants' position on this subject is that the presumption is in fact indisputable is again shown in the part of the objection not yet discussed which relates to the practical application of the presumption to the questions arising in the case.

This part of the objection is that the defendants "feel

that in a number of instances throughout the case, the doubt has not been resolved by the Master in favor of the validity of the Statute, but has been resolved in favor of the complainant." It then mentions nine subjects which it says are a few of such instances. It does not, however, offer or indicate any reason for saying that upon those subjects the doubt has not been resolved in favor of defendants, but obviously bases its assertion wholly on the fact that the conclusion was in favor of complainant, from which it is evident that the defendants' position is that such conclusion could not be reached at all without resolving the doubt in favor of complainant and violating the rule in question. In this they assume that the conclusion is required to be one of entire certainty as to the uncertain element, which it is not. The conclusion is not and cannot be required to be one of such accuracy as will eliminate all uncertainty. The precise nature of the conclusion will be best exhibited by examining it as arrived at in concrete instances. Such instances are found in connection with each of the nine subjects specified, and I will now proceed to consider these subjects in the order of their mention under the objection.

Presumption as Applied to Contingencies.

This subject is evidently regarded in the objection as having the greatest degree of uncertainty as contingencies are by their very nature uncertain. A contingency is an event the happening of which is uncertain—it may or may not happen—and if the conclusion required to be drawn here was to the effect that any particular contingent event would be certain to happen or not to happen, the conclusion could not, in the nature of things, be reached without violating the rule in question. But such is not the conclusion. In order to apprehend the

precise nature of the conclusion, it is necessary to bear in mind what it is exactly that we are here seeking to do. We are seeking to determine the value of the complainant's property. And to this end we are seeking to ascertain what it would cost to reproduce or duplicate it. This cost can by no possibility be determined with accuracy. The most that can be done in that regard is to make a fair estimate of what the cost may be expected to be, based upon knowledge and experience. Such estimates the two engineers have made. And in making them, they estimated separately, item by item, all the foreseeable costs, and stated that in addition to these foreseeable costs there were many that could not be foreseen and estimated item by item, and these costs they grouped under one head as contingent costs or contingencies.

Now, the testimony shows indisputably that according to all experience in such matters, such contingent costs are certain to be incurred in some amount, but in what amount precisely is very uncertain. It appears from a clear preponderance of evidence, that the amount to be fairly anticipated for contingent costs in a reproduction of complainant's property would be from 10 to 15 percent of the other property schedules except lands, and that this is the amount that would be added for contingencies by any competent engineer in furnishing estimates of probable cost for the guidance of investors, and it is the amount which should be added here, were it not for the presumption in question. But it is very uncertain what would be the actual amount of contingent costs and doubtful whether they would be as much as 10% or 15% of the schedules mentioned. In consequence of this doubt, the allowance which I have made is not the amount that would ordinarily be expected for contingent costs, but the minimum amount that can reasonably be expected

—the amount below which the contingent costs cannot, in reason, be expected to fall.

The conclusion thus reached by me is not that $400,000 is the amount that would actually be required to pay the contingent costs, or that it is an amount that would, according to the testimony, be sufficient to cover all of the contingent costs, but that it is a fair and reasonable estimate of the minimum amount below which the contingent costs cannot be expected to fall, and which must, therefore, be regarded as certain to be incurred beyond all reasonable doubt.

The conclusion, therefore, reached upon this subject is one that does not involve resolving the doubt in favor of complainant, but is reached after resolving all reasonable doubts in favor of defendants.

It will be noted that the defendants' specific objection to this item of contingencies is not as to the amount of the item, or that under the evidence it is too large, but that no allowance of any amount can be made on account of contingencies—which, of course, would render the presumption indisputable as far as this item is concerned.

Presumption as Applied to the Other Subjects Mentioned.

What is said here of contingencies in this connection is applicable also to the second, third, fourth and fifth subjects mentioned, viz: Taxes, Appreciation, Working Capital, and Stores and Supplies. In valuing each of these items, I resolved all my doubts in favor of the defendants.

The next two subjects, viz: Ballast, and Track Laying and Surfacing, call for specific comment. The defendants' contention here is that I resolved the doubt in favor

of complainant in refusing to depreciate either of these items.

Here we encounter the curious contention that the enactment of this statute by the Michigan Legislature raises a presumption that ballast depreciates.

Of course the question whether ballast does or does not, in fact, depreciate, can no more be affected by an act of the Michigan Legislature than it can by the Apostles' Creed. Such a proposition would be on its face highly absurd, and it can be saved from such absurdity only by the theory and assumption that in enacting the statute, the Legislature adjudged this question and found that ballast does depreciate precisely as claimed by the defendants' witness, Mr. Hansel, or by some other theory that would thus connect the question of ballast depreciation with the action of the legislature.

But this theory the defendants do not accept. On the contrary, they visit upon it severe condemnation as an attempt by equivocation to fritter away the salutary effect of this presumption, and at the same time they offer no substitute. Unless and until the defendants bring forward some principle by virtue of which the enactment of this statute is made to have a bearing on the question of ballast depreciation. I am at a loss to see how they can claim that the enactment of this statute by the legislature has any bearing whatever on the question whether ballast does or does not depreciate, and therefore how it can be said that in refusing to depreciate ballast, I failed to give due effect to the presumption. And this would be so even if I had in fact refused to depreciate ballast.

But the fact is that I did not refuse to hold that ballast depreciates, but on the contrary held that it does depreciate precisely as claimed by defendants and as testified to by Mr. Hansel. What I refused to do was, first,

to include in the inventory any ballast that had been thus depreciated, i. e., by being blown away and by sinking into the embankment; and second, to place a depreciated value on ballast that had not suffered that kind of so-called depreciation; and third, I refused to find and allow an amount for depreciation from disintegration when there was not and could not, in the nature of things, be any evidence on which to base such a finding.

What I have said here regarding ballast is applicable also to the seventh and eighth subjects mentioned, viz: (7) my refusal to depreciate track laying and surfacing, and (8) my adoption of complainant's modified train mileage ratio for the division of common property and common expenses.

The ninth specifications is that I resolved the doubt in favor of complainant in two ways: first, by finding that reduced rates will not produce increased traffic, and second, by finding that reduced rates did not, subsequent to 1907, produce increased traffic. With reference to the first, it is not a fact that I so found; on the contrary, I found that reduced rates will, in all probability, produce increased traffic. And as regards the second, the fact in that regard is a matter of record on the existence of which the presumption in question can have no bearing whatever.

In these instances, also, it seems to me that the defendants in reality recognize no possibility of overcoming the presumption by proof although they do so in theory.

This peculiar position of the defendants is regrettable. If the presumption is indisputable in fact, it ends this case as effectually as though it were so in theory also. But I can see no possibility of question that it is my duty to treat it as disputable, and therefore to the best of my ability to weigh it against the opposing evidence offered. In the performance of this difficult and delicate

task, I need and desire all the assistance possible from counsel on each side. But I am offered no principle for guidance, and as regards the principle which I have adopted, I am merely told that it is an attempt to fritter away the salutary effect of the presumption.

That it was not such an attempt, but an earnest effort to find a means of rationally weighing the presumption against opposing evidence, it is unnecessary to say, but it is important to point out that the adoption of such principle, or one that will accomplish the same result, instead of being an attempt to fritter away the salutary effect of the presumption, is the *means* and the only means by which the presumption can be given any rational effect whatever. That this is so appears clearly from what has been said above on the subject of the presumption as applied to the question of ballast depreciation.

How would it be possible within reason to say that the enactment of this statute created a presumption upon any one of the many questions of fact to which defendants apply it, except upon the principle that we must presume that the legislature actually adjudged the question and adjudged it correctly?

For example, how would it be possible to say that the enactment of this statute created a presumption that the defendants' modified train mile ratio is correct, or that their claimed value of the Marquette Station property is correct, except upon the theory that the legislature passed upon those questions and came to the conclusion contended for by defendants? In the absence of such theory, how does the enactment of this statute have any more bearing on those questions than would the enactment of a law changing the rate of interest or the regulations as to the granting of marriage licenses?

I have discussed this presumption thus fully because it

bulks so large in the defense to this case, and because we must follow one or the other of two courses—we must either find and adopt some method of measuring or weighing the strength of this presumption against opposing evidence, or else frankly recognize the presumption as absolute and indisputable, instead of saying that it is disputable, and then denying that there is any possibility of measuring it, or any propriety in trying to do so.

Before taking leave of this subject, it is desirable to call attention to another presumption regarding legislative action which, although referred to by defendants, has not been given due recognition and effect in this case. The defendants at one point contend, and rightly, that we are bound to presume that the legislature, in enacting this law, acted conscientiously and intended to observe all constitutional requirements, as was their duty; that they intended to enact a constitutional law, and did not intend to enact an unconstitutional law; and as it is well settled that in order to be constitutional, a rate law must be such as will yield a fair return upon the property employed, the legislature did not intend to enact a law that would not yield such return. Now if, on such careful investigation as has been made in this case, it is found that the prescribed rate will not yield such return, are we to presume that it is, nevertheless, the will of the legislature that this law be enforced against this railroad, or are we to presume the contrary? Are we not to presume that the will of the legislature in enacting this law was that it be enforced against all railroads in the state unless and until it is found on judicial investigation that it will not fulfill constitutional requirements in the case or any particular road, and that when so found, it be not enforced? The point here sought to be made is, not that there is any necessity for finding that such is the legislative will, but that an injunction

against such enforcement is not necessarily or presumably a nullification or overriding of the legislative will, but is presumably in accordance with that will.

Having thus determined the evidential requirements which must be met by the complainant, we proceed to consider whether those requirements have been met. Have the complainants proved beyond a reasonable doubt that the prescribed rate will not yield the required return on the value of the property employed? This question resolves itself into three subordinate questions, viz:

1. What is the value of the property employed?

2. What return may reasonably be expected under the prescribed rate? and

3. Will that return constitute a fair return upon the value of the property employed?

These three subordinate questions will be considered in the above order.

The Value of the Property Employed.

In proceeding to make the valuation here required we encounter at the outset a peculiar difficulty. We find that the required valuation must be made on a basis that involves an exact reversal of the order of economic reasoning usually employed in making valuations. In the order of economic reasoning usually and almost universally employed in making valuations the value of a thing is determined upon the basis of the profitableness of its most profitable use; but in the valuation to be made here the value sought is not a value that is determined on the basis of the profitableness of the most profitable use

to which the property can be put, but is, on the contrary, a value that is itself to constitute the basis on which the profitableness of that most profitable use is to be determined. The value sought must be of a kind that will properly constitute such a basis.

What is that kind of value? What kind of value is there that is capable of performing this unusual and one might say, abnormal function of determining the profitableness of the most profitable use? This question must be clearly and satisfactorily determined at the outset, as otherwise all subsequent discussion will be liable to constantly recurring confusion of thought resulting from uncertainty as to the meaning of the word value as here used. The necessity for determining this question clearly in advance, and the difficulty of doing so are strikingly shown in the numerous differing views that have been put forth as to what precisely is meant by "value" in rate cases, some of which go so far as to say that there is, in reality no such thing as value in rate cases; and that the rights of the respective parties must be determined by other considerations. Thus Professor H. C. Adams, testifying in this case says, "In my judgment this thing that we call 'value' in practical questions is a thing to be gotten at in order to arrive at equitable conclusions between contending parties, and it is always necessary to know what the contention is and what the relative rights of the parties are in order to proceed in any analysis or definition of values."

And Professor E. W. Bemis in a Gas Case at St. Paul in May, 1914, said in effect that in rate cases there is in reality no such thing as value, but that "fair value" or "amount of property" or "fairness" is meant.

The complainant's counsel did not undertake to specify the particular kind of value, or principle of valuation that should be uniformly applied to all the railway prop-

erty in this case, but left the question open. But the defendants' counsel did so specify and stated on pages 189 to 192 of his printed brief as follows:

"The value of the property determines the amount of return to which the company is entitled. One of the principal problems of the case is to find that value. That value is not the original cost, the investment, the value of the stocks and bonds, the book or cost value, the cost of reproduction new, or that cost of reproduction affected by depreciation. There is no definite rule for determining precisely what that value is but it is safe to say that it is such a sum as in the judgment of the Court, considering the property, its history, and all surrounding conditions and elements, the company is entitled to a return upon, and the public is required to support."

"The high point of property value which can be used as the basis for figuring the return in a case contesting rates, is the commercial value—the value which is predicated upon the ability of the road to earn under normal and competitive conditions with rates unregulated. A cost of reproduction or present physical value of the property may bring the basis for fixing rates below the sale or commercial value of the property, but a high cost of reproduction cannot be permitted to carry or fix the amount on which the utility shall be entitled to a return, above the commercial or sale value."

"The reason is obvious. The utility is entitled to a return upon the value of the property, not upon its cost, and value is not fixed by cost, by present physical condition or by the amount or value of stocks or bonds, but is fixed by the intrinsic commercial or sale value."

These differing views of the subject are typical of what is very generally found in the discussions of value in rate cases in consequence of which one often seems to be traveling in a circle and arriving nowhere in particular; and they emphasize the necessity for a clear determination of the kind of value that is to be sought and arrived at as preliminary to the work of valuation.

I am unable to see how any proper valuation for rate making purposes can be made without selecting and applying a kind of value or principle of valuation that will furnish a proper basis of rates, and that will be applicable to all the property. The complainant recognizes this necessity and accepts therefor the principle of valuation hereinafter set forth.

The position taken by defendants' counsel tacitly recognizes the need of such a principle of valuation and undertakes to supply it, but the principle which he offers, I am unable to understand clearly. He says:

> "The value of the property determines the amount of the return to which the company is entitled"; and "that value is such a sum as the company is entitled to a return upon."

The difficulty about understanding this is that it seems to me the same as saying that the value determines the amount on which the company is entitled to a return, and the amount on which the company is entitled to a return determines the value, which is so plainly reasoning in a circle that I feel that counsel must mean something that I do not catch. And this same peculiarity, I think, is found in all attempts to use the conception denoted by the phrase "commercial value" as a basis of rates.

With these remarks upon the difficulties of the problem, we now return to our question, what kind of value is it that furnishes the proper basis for rate-making.

Value may be defined as the desirability or worth of a thing as measured by the desirability of something else. The commercial value of a thing is its desirability measured by the desirability of money; and since money, as the medium of exchange, is the measure of the desirability of all things, the commercial value of a thing is its desirability as measured by the value of all things.

The word "value" is thus a term expressive of relationship. It expresses the relationship existing between the thing valued as regards desirability and some person or class of persons. Hence, everything of value has as many different values as there are persons to whom it bears differing degrees of desirability.

Again, the commercial value of a thing is always based upon the profitableness of some use to which the thing can be applied. Hence, everything has as many different values as there are different degrees of profitableness in the uses to which it can be applied.

From these premises, it follows that the kind of value which we are seeking as a basis of rates, must be a value based on some particular use, and it must be a value to some person or class of persons.

On the basis of what use and to what person or persons is the estimate of the value of a railway property to be made? In the Minnesota rate decision, certain values were rejected because they were based on railway use and were therefore dependent on rates; but it is obvious that that must not be taken to mean that all values based on railroad use are to be excluded; on the contrary; it is perfectly clear that for rate-making purposes, all values of railway property must be railway values, i. e., values based on railway use. A valuation of railway property for some other than railway use would be absurd on its face as a basis for railway rates. We must, therefore, proceed on the assumption that the value which is to

serve as a basis of rates is a value for railway use—adding, however, that although a value for railway use, it must not be a value that depends upon rates. What value is there for railway use that does not depend upon rates?

I have said that every value must be a value to some person. Now, every object of value to a person has for that person three distinct values, viz., a use value, a sale value, and a replacement cost value. These three values, I say, are entirely distinct; and they may vary widely. A thing may be of much more value to its owner to use than to sell, and vice versa; and the replacement cost, i. e., the amount that it would cost to replace or duplicate the thing may be greater or it may be less than either of the others. Now, both the use value and the sale value of a railway property depend upon rates, and for this reason neither can be made the basis of rates. But the replacement cost value does not depend upon rates. The amount which it would cost a railway company to replace any portion of its property would be the same whether the rates which it was permitted to charge were high or low.

Hence, if the foregoing reasoning is correct, replacement cost value is the value that fulfills the two requirements above mentioned, viz., that it be for railway use, and that it be independent of rates. And as it is the only value that fulfills those requirements, and as those requirements are absolute, it is the only kind of value that is available for the purpose of a rate case.

In this case, it is recognized as such and adopted by the complainant's counsel, but the defendants' counsel claims that the kind of value to be employed here is not replacement cost value, but commercial value.

Now, the commercial value of a property is the amount for which it can be sold, either in bulk or in parcels, and

the value that is contemplated here by defendants' counsel is that which would be realizable from a sale in bulk—i. e., a sale of the entire property as an organized and operating railroad property. But the amount for which the property could be thus sold would clearly depend upon the rates permitted to be charged for the service in which the property is employed. How, then, is it possible to use commercial value as a basis of rates? This difficulty is recognized by counsel and is sought to be met in the language above quoted by defining commercial value as "the value which is predicated upon the ability of the road to earn under normal and competitive conditions with rates unregulated."

The position here taken by counsel, I am unable to understand clearly as it seems to me to lead to results directly opposite to what he desires. By "rates unregulated" is evidently meant rates unregulated by statute; and it is true, of course, that the commercial value of a road with rates unrestricted by statute would not be dependent upon statutory rates as there would be no such rates; but the rates there chargeable would be restricted by the competitive conditions mentioned, and by common law requirements as to reasonableness; and the commercial value of the road would be dependent upon the rates as thus restricted; and it would be determined by the road's "ability to earn" under those competitive conditions.

Now, if the commercial value so determined is the kind of value to be employed in a rate case, what will be its effect upon rate-fixing statutes? Is it not clear that when thus judged every rate fixing statute will necessarily be found either unconstitutional or useless? If it lowers the rate that is maintained under competitive conditions, it is unconstitutional; if it does not do so, it is useless. If the competitive conditions under which the

complainant's road is operating are such that the road can maintain no higher rates than those fixed by the statute in question, the statute is useless; but if the competitive conditions are such that the road could maintain higher than statutory rates, then the commercial value of the road would be determined by the higher rates and the statute if put into effect, would not yield a fair return on that value and would, therefore, be unconstitutional.

As this result is the direct opposite of what counsel desires and as I cannot see how he reaches any other result, I infer that I have been unable to understand his contention correctly.

Furthermore, if this theory of commercial value in a rate case is correct, this case is being tried on a wrong theory, and the great amount of testimony taken on the subject of value has been taken to no purpose. That testimony does not show or even tend to show with any directness the commercial value of the property contemplated by this theory. The value which it is designed to show is that which is represented by reproduction cost new less depreciation plus appreciation. This value may, or it may not be the same in amount as the commercial value claimed by defendants, but if it is the same, such identity is purely accidental as there is no relationship existing between the two kinds of value that would cause such identity—the two kinds of value being determined by different sets of conditions. This being so, this claim of commercial value, if sustained, would either put an end to this case or require that it be tried over again on different testimony.

In fact, we may omit the above alternative and say that it would put an end to the case finally and absolutely for the reason that there could be no testimony produced for the trial of the case and the determination of value on

that theory of value. The value of the property based on its earning power under normal competitive conditions with rates unrestricted by statutory regulation could be estimated only where there had been experience under such conditions which would furnish results available for such a basis of estimate, and there has been no such experience. The company has never operated with liberty to charge rates unregulated by statute and limited only by the danger of discouraging business or driving it to competitors. It knows nothing of what could be done under such conditions and can form no estimate whatever. The only knowledge that it has of the earning power of the road is that derived from its experience in operating under rates restricted by statute—a knowledge which, though available for estimating what may be expected from future operations under rates restricted by statute, furnishes no basis for estimating results realizable from operations under rates free from statutory restriction.

I am, therefore, unable to see how the defendants' theory of commercial value can have any possible application in this case.

In addition to the foregoing, I am also unable to see how the theory in question can be harmonized with the decided cases. The Minnesota rate case and rate cases generally have proceeded on the theory herein adopted, and have settled quite clearly that the kind of value to be determined in a rate case involving the question of confiscation is that which is represented by reproduction cost new less depreciation plus appreciation.

Now, this kind of value, although it is commercial value in a certain and proper sense (as hereinafter pointed out) is not commercial value in the sense of the defendants' theory nor has it any direct connection therewith.

When, therefore, the courts say that reproduction cost new less depreciation plus appreciation may be taken as value for the purposes of a rate case, they do not mean that that is necessarily the economic value of the property in question, but that it is a sufficiently accurate estimate of value for the purpose in hand, viz; to determine what it would cost the company to supply that particular property for public use; in other words, it is replacement cost value judicially determined.

Now in what relation does this replacement-cost value stand to commercial value? Curiously enough the answer to this question is that although in a certain sense different, these two values, in a certain other sense, are identical—that the value thus judicially determined as replacement cost value is also commercial value—not in the sense of commercial value which is the amount for which the property could be sold by the company in bulk as an organized and operative entity as claimed by defendants (that value being dependent on rates and therefore inadmissible) but in the sense of the amount for which the property could be sold in parcels, not by the company wanting to sell, and breaking up the property into parcels to be sold to various purchasers and scattered in other uses, but sold by owners of the various parcels to the company wanting to buy for the purpose of assembling and organizing the parcels into an operating instrumentality for transportation. In other words, the replacement cost value of each parcel thus determined is the commercial value of the parcel to both vendor and purchaser, i. e., it is the amount for which it could presumably be sold by the owner to the company and vice versa, the amount for which it could presumably be purchased by the company from the owner. And the total of all the values of the parcels thus determined is the total commercial value of the entire property, not as an

operating instrumentality for transportation (the value of which would depend upon rates) but as an aggregation of properties possessing potentialities for organization and railway use—a value which is not dependent upon rates and the only value that is not so dependent.

This then, is the kind of value to be employed in a rate case, and it is here called replacement cost value, because that name indicates the basis on which the value is estimated, and distinguishes it from reproduction cost value and from commercial value. In the present case it is, as already pointed out, the only kind of value that can be determined for it is the only kind shown by the evidence, there being no evidence of any value other than that which shows the amount of reproduction cost and the condition of the property as regards depreciation and appreciation.

The conclusion thus reached, the defendants' counsel does not accept. His contention is that while the replacement cost is a relevant subject of inquiry, it is only one of a number of subjects of such inquiry; that replacement cost is only one of many of the evidences of value all of which must be considered, and that therefore, when we have estimated that cost we have not determined value but must go further and consider many other evidences of value and base our valuation on all of them instead of on replacement cost alone. The position thus taken involves an idea of valuation in rate cases which has been more or less entertained in connection with the various discussions on the subject, and has, it seems to me, tended to render the work of making such valuations one of baffling, if not hopeless, uncertainty. It is an idea which should either be fully and clearly recognized and established, or else as clearly repudiated for, in its present status it is only a serious embarrassment. It is of so much importance both in this case and in all rate cases,

as to justify further discussion of it here. As stated in defendants' brief, page 189, in the language already quoted above, it is as follows:

> "That value is not the original cost, the investment, the value of the stocks and bonds, the book or cost value, the cost of reproduction new, or that cost of reproduction affected by depreciation.
>
> There is no definite rule for determining precisely what that value is, but it is safe to say that it is such a sum as, in the judgment of the court, considering the property, its history, and all surrounding conditions and elements, the company is entitled to a return upon and the public is required to support."

This I believe to be as good a statement of this idea of value as can be found anywhere, and, to my mind, it throws the whole subject of judicial valuation in rate cases into a serbonian bog of confusion and uncertainty. Examine it, and see to what it leads. It first shows what this value is not; thus "it is not the original cost of the investment, the value of the stocks and bonds, the book or cost value, the cost of reproduction new"—(all of which is perfectly true)—"or the cost of reproduction affected by depreciation" which is the exact point in question, and which, if true, would promptly put an end to this case. It would do so because the value which is shown by reproduction cost new less depreciation is, as we have already seen, the only value proven in the case, there being no evidence on which to base a finding of any other value.

Having thus told us what the value is not, the statement then proceeds to tell us what it is, as follows: "It is such a sum as, in the judgment of the Court, considering the property, its history and all surrounding conditions

and elements, the company is entitled to a return upon and the public is required to support."

This involves an inversion of cause and effect. It is, of course, true that the value of the property "is the sum that the company is entitled to a return upon", but the fact that it is so does not help us to determine value, but on the contrary, is precisely the reason why we are trying to find out what the value is—the reason for wanting to know the value being that we want to know the amount that the company is entitled to a return upon, and the only way to find this out is to find the value of the property. But, according to the statement of counsel, we are doing exactly the reverse; instead of finding the amount that the company is entitled to a return upon by finding the value, we find this amount that the company is entitled to a return upon by "considering the property, its history, and all surrounding conditions and elements" and then assuming that amount to be the value. This seems to me a clear case of putting the cart before the horse.

When the courts say that the company is entitled to a fair return upon the value of the property, I understand that we are required to ascertain the amount of that return by finding the value of the property and determining the amount required to furnish a fair return in that value; but according to the defendants' theory we are required to do exactly the reverse, viz; first ascertain the amount of return that the company is entitled to by finding its earning power under certain conditions, and then estimating its value on the basis of its earning power.

For the foregoing reasons, it seems to me that the idea of commercial value in rate cases is merely a prolific source of confusion, and should be wholly excluded from consideration.

The foregoing discussion of value applies to all values except bare land values estimated independently of improvements. And as to those values it applies so far as regards the principle of replacement cost. There, as elsewhere, it is the amount that it would cost the company to acquire the property that determines the value on which the company is entitled to a return.

How is that amount to be determined? How can we ascertain or estimate the amount that it would cost to purchase a certain parcel of land? In the case of property other than land, we are able to estimate cost by ascertaining unit prices of material and labor and from them computing the cost of reproducing the thing under valuation. But in the case of land, this of course cannot be done as a parcel of land is not the product of labor, but is *sui generis*, and cannot be duplicated. In order to be acquired, it must be purchased from the owner, and if his ownership were absolute the cost of acquisition would depend entirely upon his will, and therefore could not be estimated. But land ownership is not absolute but is subject to the power of eminent domain by means of which the owner may be compelled to sell for a price determined judicially, and this power thus performs for land values the function which the power to reproduce performs for other property values. As the willingness of the owner to sell is an incalculable element, the estimated cost of acquisition or replacement cost value of land must be the amount that it would cost to acquire the land by condemnation proceedings.

How is that amount to be determined? How shall a Court of Equity in adjudicating a rate case determine or estimate the amount that it would cost to acquire by condemnation a certain parcel of land? Shall it form its own estimate of the value of the land from proper evidence and assume that the amount so found would be the cost

of acquisition by condemnation? Or shall it undertake to estimate the amount which a jury would award in such condemnation and assume that to be the cost of acquisition?

The only authoritative answer that we have to this question is that contained in the Minnesota rate decision. In that case the trial court was asked to and did take the latter course. Testimony was introduced showing that it was customary for the jury in condemnation cases to award the owner more than the value of the land for other purposes, and that the amount of this excess value was from two to three times that of the normal value of the land; also that the company would be compelled to pay severance damages, and also certain costs for legal expenses, engineering, superintendence contingencies, interest during construction, etc., which should be included in the estimated cost of acqusition.

This seems on its face a quite natural and logical application of the general principle of determining value by cost of reproduction or replacement; there is no doubt that the actual cost of acquisition by condemnation may be and frequently (perhaps generally) is enhanced over normal land values by some or all of these considerations, but on examination it is seen that such an application of the principle of reproduction cost is entirely inadmissible. It would require the Court not only to find as a fact an improper custom on the part of juries in condemnation cases of making excessive awards but also to measure the extent of this excess generosity and accept the amount of it as the value of the property as determined by cost of acquisition. In the decision of the case by the Supreme Court this is held to be an unreasonable application of the cost of reproduction method of ascertaining present value, and is declared to involve impossible assumptions. The Court there says:

> "It is impossible to assume in making a judicial finding of what it would cost to acquire the property that the company would be compelled to pay more than its fair market value. It is equipped with the governmental power of eminent domain. In view of its public purpose, it has been granted this privilege in order to prevent advantage being taken of its necessities. It would be free to stand on its legal rights and it cannot be supposed that they would be disregarded."

From this it seems clear that in estimating the cost of acquisition the Court is not to speculate upon what a jury would find in condemnation of the land, but is to form its own estimate of value from the evidence produced and to assume that the land could be acquired for that amount under the law of eminent domain. This may seem to involve a logical inconsistency in that it determines cost of acquisition by value instead of determining (as we were supposed to be doing) value by cost of acquisition, but the inconsistency is apparent rather than real; the value that here determines the cost of acquisition is that which the law prescribes shall be awarded in condemnation cases and the reason for taking it as cost of acquisition is that it is so by law prescribed; while the value that is to be taken for testing the validity of rates, although the same in amount, is taken because it represents the cost of acquisition. The distinction may seem shadowy but it is real and its substance consists in this, that the value that is to be used as a basis of rates must have a basis and its basis must be one that does not depend upon rates and the only basis that fulfills this requirement is, as already pointed out, that which is furnished by the conditions which determine the replacement cost. And this basis is equally available whether those conditions consist in legal requirements as in the case of

land values, or in present unit prices of material and labor as in the case of other property values.

The final conclusion at which I arrive therefore on the subject of value is that both as to lands and as to other property, the inquiry must be directed to the ascertainment of replacement cost, which in the case of property other than bare land is reproduction cost less depreciation plus appreciation, and that when that cost has been ascertained by proper estimate we have the valuation required for testing the validity of statutory rates.

To my views on the method of determining value defendants' objection No. 3 is directed. The objection is to my alleged finding and conclusion "that the cost of reproduction value less depreciation, or the 'replacement cost value', is to be taken as the absolute measure of the value which must be sustained by the rates permitted to be charged." The argument is as follows:

> "Not only the leading case of *Smyth vs. Ames* (169 U. S. 546-47), but practically every rate case, to the present, recognizes that no single element or rule of valuation is to be applied in determining the value of the property which must be supported by rates, and that all the company is entitled to ask is a fair return on that which it employs for the public convenience. Value is not determined by replacement cost, though that may be a consideration in determining what is fair to the public and the utility, in the light of the rule that the interests of both must be considered."

Whether this statement is correct or not depends upon what the defendants mean by the word "recognizes." If they mean that all the cases, or any cases, have discussed

the question of the need or admissibility of a single rule or principle of valuation, and have held that no such rule or principle can be applied or recognized, the statement is, I believe entirely incorrect. I have carefully examined all the federal cases which I have found on this subject, and have found no case of which the statement is correct.

If they mean by the word "recognizes" that all of the cases have been adjudicated without specifically discussing the need or desirability or practicability of formulating and applying such a rule or principle, the statement is, with the exception perhaps of the Minnesota rate case, substantially true, and for the reason that the question was not distinctly raised in any of them. The fact that the kind of value precisely that is required to be found in a rate case is of special character and somewhat different from that which is ordinarily meant by the word value in common parlance, does not seem to have been brought out in the cases until the decision in the Minnesota rate case rendered while this case was pending. In that case questions arose which called for a more careful consideration of the subject of value in a rate case than had hitherto been called for, and the court in its decision discussed the question more fully than had been done in previous cases, and therein laid down such principles for the valuation of railroad property in a rate case as were required for the decision of that case.

That decision being the latest and most authoritative utterance on the subject, I studied it carefully in an effort to determine what kind of value precisely it was that the court intended should be found and applied in a rate case, but was unable to settle that question clearly in my own mind, because the word "value" was used in different places in connection with different qualifying words in such a way that the precise kind of value intended was not clear to me.

I thereupon asked from counsel on each side answers to a series of questions on this subject, and received answers from each, but although helpful in some ways, neither of the answers attempted to define or specify the precise kind of value required, and they were in disagreement on some essential questions.

After a further and very careful study of the subject, I reached the conclusion set forth in my findings, viz: that the kind of value that is required to be found in a rate case is what I have there called "replacement cost value," meaning by that reproduction cost, less depreciation plus appreciation. This I became convinced is the kind of value that meets the requirements of the Minnesota rate case and of every rate case, and that it is the only kind of value that will meet those requirements. That conclusion I believe to be in entire harmony with every adjudicated case instead of being in conflict with all of them, as here claimed by defendants.

In referring to the case of Smyth vs. Ames, counsel evidently have in mind the part of that decision which mentions "the original cost of construction; the amount and value of outstanding bonds and stock, and the probable earning capacity of the property under rates prescribed by statute" as some of the subjects which may be considered in valuing the property in a rate case; and in asserting that my conclusion conflicts with that case they evidently assume that the court there intended to say that the subjects mentioned must enter into and affect or influence the valuation, and therefore that no principle of valuation is admissible that does not take them into account. I can see no good ground for assuming that such was the intention in the language quoted; on the contrary, it seems to me that the language could not, in the nature of things, have been so intended. And if, in fact, the language quoted is capable of only the con-

struction given it by defendants, it has been disregarded by the later cases, none of which recognizes the proposition that the original cost of construction, the amount and value of outstanding bonds and stocks, or the probable earning capacity of the property under rates prescribed by statute, have any bearing in determining the value on which a public service corporation is entitled to a fair return.

Defendants' objection No. 4 relates to the same subject as objection No. 3 last considered. The objection is, in effect, that it is commercial value rather than replacement cost value on which the complainant is entitled to a return, and which therefore is to be determined as the basis on which the validity of the prescribed rate is to be tested. I have already found that the commercial value of the property in its entirety as an operating instrumentality cannot be taken as a basis of rates or as a basis on which to test the constitutionality of the prescribed rate, because it itself depends upon rates; and for this finding, and the further finding that it is replacement cost value that must be taken as such basis, I have already given my reasons very fully. On a careful consideration of this objection and the arguments advanced in support of it, I see no reason for changing the views already expressed, and no occasion for further discussion of the subject by me, except to explain why the argument in support of the objection fails to convince me or to show how commercial value can possibly be made to serve as a basis on which to test the constitutionality of the rate.

The argument is in substance this: that a railroad may not be worth commerically the amount of is replacement cost, and that where such is the case, replacement cost cannot be made the basis of rates, because it would be inequitable to require the public to pay a return on any greater amount than the commercial value, and that

therefore the rates should be reduced accordingly. Now, it is perfectly true, of course, that a railroad may not be worth commercially the amount that it would cost to replace it; but to say that where such is the case, that fact furnishes a reason for a reduction in rates, is a proposition that is to me wholly incomprehensible. It seems to me to involve a kind of mental inversion—the drawing of a conclusion that is the direct opposite of that which is plainly called for by the premises. Wherever a road is not worth commercially the amount of its reproduction cost, that failure of value is, of course, due to its inability to earn enough to pay a fair return on that amount, and that inability is intself due to one or the other of two causes, viz: either to a lack of business, or to restrictions imposed either by statute or by competitive conditions on the ability of the company to charge remunerative rates. And if it is true that the failure of earnings calls for a reduction in rates, the reason for such reduction must be found in one or the other of these two causes or conditions. Now, how is it possible to find in either of these causes a reason for compelling a reduction in rates? Suppose the failure of earnings is due to statutory rate restrictions; would it not be wholly irrational to say that such failure of earnings calls for a still greater restriction, as would be the case according to the defendants' theory?

Proceeding on the defendants' theory of the kind of value that is supposed to be protected by the constitution, how could any statutory rate be questioned, and what would there be to prevent an entire confiscation of the company's property?

If a falling off in commercial value is held to justify a reduction in rates, the constitutional protection against confiscation is thereby rendered a mere myth. Each falling off in commercial value will call for a reduction in

rates, and each reduction in rates will cause a further falling off in commercial value which further falling off in value will, in its turn, call for a still further reduction in rates, which will cause another falling off in value, and so on indefinitely until the entire value of the property disappears automatically under the working of this theory.

Precisely the same results would follow if the failure of earnings was due to either of the other causes. If it was due to competitive conditions, those conditions would, under this theory, call for a reduction of rates which would cause a further falling off in value that would call for a further reduction in rates, and so on until the end above indicated was reached.

Thus the competitive conditions would start this process of adjusting rates on the basis of commercial value, and that is all that would be necessary, for, once started, it continues to operate, automatically, until it has finished its perfect work in the complete wiping out of the value of the property.

If the failure of earnings was due to lack of business, the result would be the same as when due to competitive conditions, for competitive conditions means merely a lack of business sufficient for both competitors.

In illustration of their contention for commercial value, defendants cite a supposable case where the commercial value of a road has been greatly reduced by the building of a parallel line competing at all points, and where the quantity of business in the territory is only sufficient to pay a return on the reproduction cost of one of the roads. There they say the public should not be required to pay a return on the reproduction cost of both roads, but only on the commercial value of each as that value is affected by those competitive conditions, and that the rate should

therefore be reduced below what it was before the building of the competing line.

This contention involves a confusion of issues. It involves the assumption that the issue here is the same as it would be where one or both the supposed roads is asking for an increase of rates because of the increased amount of property created by the addition of another road. If such were the issue, the contention that such increase should not be granted would be perfectly sound.

But the issue in a rate case involving the question of confiscation, instead of being the same or similar, is exactly the reverse. There the claim is not for an increase in rates, but for protection against a decrease, and the question is whether there is good ground for a decrease.

In the supposed case, the claim of the railroad company would be that the building of the competing line and the cutting in two of the earnings furnishes no reason for a decrease in rates,—that the duplication of the property devoted to the service does not lower the cost of the service in the least, or increase the earnings realizable from the business, but only has the effect to spread these earnings over a greater amount of property,—thus causing a loss, not to the public, but to the owners of the property —and that it is contrary to all reason to say that this loss to the owners entitles the public to a reduction in rates involving a still further loss to the railroads.

For the foregoing reasons, I am unable to see from defendants' objection and argument thereunder how commercial value can possibly be made to serve as a basis for testing the validity of rates.

But it is such a reduction and on such grounds that the defendants call for in this case. They liken the complainant's road to a road which has been paralleled by a competing road; they claim that it has since its construction been subjected to competition at all important points,

which has greatly cut down its earning power, and that for this reason it is not worth commercially what it would cost to reproduce it, although it was worth that amount when constructed; and that the rate should therefore be reduced.

Now, suppose that the rate is reduced on this ground. Can there be any question that the commercial value of the road would be thereby further reduced, and when such reduction in value has taken place, is there not then just as good reason for a further reduction in rates as there was for the reduction just made? And is there any reason why the process of rate reduction thus started should not continue, automatically making one reduction after another so long as there was any value remaining for it to operate upon? Is it not clear from these considerations that commercial value cannot possibly be made to serve as a basis of rates? Nay, is it not clear that the prescribing of rates by the Legislature on that basis would be a complete inversion and abuse of the legislative power to regulate rates? In order to see that it would be it is only necessary to recall the nature and purpose of that power, which is this: In granting a railroad charter, the rate for the time being is fixed in accordance with present conditions; but the charter will run for a long period, or indefinitely, and it may be that in the course of time those conditions will change, that the business of the road may so increase that the company can well afford to carry at a lower rate than that prescribed in the charter, and as the business may be more or less of a monopoly, the Legislature reserves the right to change the rate to correspond with the changed conditions and prevent the company from unduly profiting at the expense of the public, but always with the understanding that this power cannot be exercised in such a way as to deprive the company of its property rights,

which are the rights to render the service and to charge such a rate therefor as will pay what the service is fairly worth, which is such a rate as will pay all expenses and a fair return on the value of the property employed.

Now come the defendants with their doctrine of commercial value, and claim that the complainant's rates should be reduced by this reserved legislative power, not because their business has *increased* to such an extent that they can afford to carry at a less rate, but because their business has decreased, and decreased to such an extent that even under the former rate, it will not yield a fair return on the value, and therefore the property is not worth what it would cost to produce it. To make a reduction in rates on such ground would, it seems to me, be to turn the whole scheme of legislative rate regulation topsy turvy. If rates can be regulated by the Legislature on this principle, railroad property in Michigan has no value, except such as the Legislature may choose to give it, and therefore nothing to be protected by the constitution against confiscation.

Valuation of Complainant's Property.

To meet the issues in this case, complainant caused an inventory and appraisal of all its property to be made as of date June 30th, 1911, by Henry E. Riggs, a civil engineer, with special railroad experience. The defendants later caused an inventory and appraisal to be made on their behalf by Charles Hansel, a civil engineer with special railroad experience as of date October 1st, 1912. Still later in the case, the complainant company caused another inventory and appraisal to be made by Mr. Riggs as of date June 30, 1913. These inventories were arranged in schedules, which schedules were numbered from 1 to 43, inclusive, and both engineers followed substantially the same method. In making my valuation, I

follow the same schedules, using the title for each schedule used by the engineers and including in the valuation of each schedule the property which they included therein.

In connection with each schedule the various objections made thereto are considered and discussed, both as regards property and principles of valuation, except where such objections would be more appropriately considered in connection with another branch of the case.

Schedule 1.—Right of Way and Station Grounds.

Before proceeding to the general valuation of complainant's lands, it is desirable to consider certain parcels of the same with reference to their special character and value. These are as follows:

Lands With Special Value on Account of Their Adaptation for Railroad Purposes.

In this schedule are embraced two tracts of land for which complainant claims a special value on account of its adaptation for railroad purposes, viz, the so-called South Yard in the City of Marquette, in the County of Marquette, and the right of way in Houghton County from Pilgrim River to and including the Houghton terminal.

The defendants do not deny the complainant's "right to include any value due to special adaptation which inheres in the land itself", but claim that such "value is not ascertainable by reference to conditions which measure it in the hands of the taker instead of in the hands of the individual owner;" and their objection is based upon the claims that the special value here claimed by complainant is one that is determined by reference to such conditions, i. e., that it is the special value of the property to the complainant as a component part of its rail-

road property as an organized entity. If the special value claimed were such in fact, it would be subject to this objection, but it is not as such that it is claimed by the complainant. It is claimed by them as a value which inheres in the land itself, which would exist in the hands of any owner, and be realized by any railroad having occasion to make use of the land.

I find that the special value as claimed by complainant exists in each of the two tracts of land in question; that it exists in the Marquette property to the amount of $29,590 in excess of the value of the same land for other than railroad purposes of which total $22,890 appertains to the freight service, and $6,700.00 to the common service; that it exists in the land of Houghton County to the extent of $8,534 in excess of the land for other uses, of which amount $2,449 appertains to the freight service and $6,085 to the common service. That these two tracts of land have a special value for railroad purposes is undisputed in the case. Defendants' own witness, Mr. Hansel (Record 5103) testified that the Marquette yard was the natural place for a yard and the land by nature adapted for a yard. He also testified that the right of way practically all the way from Chassel to Houghton possessed like special value.

Mr. R. C. Young, an engineer, estimated the cost of constructing a yard at Marquette in the place next best adapted for the same. He found that this yard could not be so cheaply operated or constructed as the south yard, and making allowance for this extra cost of construction and operation, he placed the value of the South Yard at $108,800 more than the value of the cheapest substitute yard which could be found, provided the value of the land in each yard for other than railroad purposes was the same. He testified that he knew that such value was not

equal but that the land in the South Yard was more valuable, but he could give no definite figure.

As this substitute yard was located on land owned by the complainant and valued in this case, I am able to supply from other testimony the necessary valuations. I have found the value of the land in the South Yard for general purposes to be $101,710 and the substitute yard $22,500, or a difference in favor of the substitute yard, by reason of its less valuable land of $79,210, thus making the south yard more valuable by reason of its natural adaptation to railway purposes by $29,590. Mr. Young's testimony on this subject will be found Record pp. 7000 to 7014.

The special value of complainant's land from Pilgrim River to and including the Houghton Terminal was estimated by an engineer, F. M. Batchelder, by a comparison of this route with the next most available and cheapest route. The calculation was along the same lines as Mr. Young's valuation, except that it was not necessary to take into consideration difference in cost of operation. (Record 6485-6608.)

Lands with Water Rights Appurtenant.

At the City of St. Ignace in the County of Mackinaw, the complainant owns lands on the harbor which fronts on the Straits of Mackinac. In the City of Marquette, in the County of Marquette it owns lands on the harbor which front on Lake Superior; and in the City of Houghton in the County of Houghton it owns lands which front on Portage Lake.

With reference to the company's lands at St. Ignace which abut upon the water, it was the claim of the defendants that the lands and the water right appurtenant thereto should be valued separately, and the value of the water rights be excluded from the inventory of the com-

plainant's lands, because the water rights were not necessarily for railroad use.

The facts are that at this place the complainant maintains a slip for the landing of ferry boats, by which ferry boats alone complainant's railroad is able to make connection with the Michigan Central and Grand Rapids & Indiana Railroads in the Lower Peninsula of Michigan. It also maintains a lumber dock for the shipment of lumber by water, and a merchandise dock for the reception from and delivery to boats of freight and passengers.

The complainant's claim that there is no occasion for valuing water rights separately, but that the entire value of the property including water rights should be included in the inventory for two reasons. First, that the water rights are actually in railroad use by reason of the fact that it is necessary to control those rights in order to secure the needed free access to and use of the company's structures now in the water there, as such access and use might otherwise be cut off or impaired by the exercise of such water rights were they in the hands of others; and second, that wherever property is in actual railroad use the company is entitled to a return upon its full value even though some part of that value grows out of rights which are not being actively and fully exercised by the company.

Each of these claims raises a distinct and somewhat difficult question, the former a question of fact and the latter a question of law.

As to the first question, viz: Is it a fact that the control of the water rights of all those shore lands at St. Ignace, is required by the company in order to protect the railway use of their structures in the water against outside interference?

In answer to this question I find that it is not possible to determine from the evidence exactly what quan-

tity of such shore lands it is necessary for the company to thus control. That it is necessary for the company to control for that purpose the water rights of some of the shore lands, other than what is required for access to their structures in the water, is unquestionable; but just how far such necessity extends does not appear from the evidence and is difficult to determine with accuracy on account of the shape of the bay on which these riparian lands lie. But such determination is not necessary for the purpose of this case—the only question here being, not what lands are so required but whether the lands listed by complainant are so required. On this question the evidence shows that all the riparian lands at St. Ignace listed by complainant are so required, and I find as a fact that all the shore lands at St. Ignace listed by complainant are in railroad use and fairly necessary for such use—necessary either for the maintenance and use of their existing structures or to prevent the erection of other structures which might interfere with such use.

As to the second question, viz, whether the company is entitled to include in their valuation of these lands the value of the water rights even though they do not exercise those rights otherwise than required for protection of the free use of their structures, now in the water, while the question may not be entirely free from doubt, I find that if the company are entitled to list the shore lands in the inventory as being in railroad use, they are entitled also to their full value of the water rights. I have accordingly so valued those lands, making no separate valuations of these water rights. In fact no separate valuation could be made by me of these shore lands at St. Ignace or of those at Houghton, as there is no testimony on which to base it.

At Marquette the tract of riparian land owned by the

railroad is considerable in extent and is put to varied uses.

At the commencement of this suit, the railway company owned and operated two ore docks, one of which ceased to be used during the progress of the suit. It owned a dock for the unloading of coal from boats and also a merchandise dock. It had on the property various buildings used by it for office and storage purposes. A very small part of the land was leased to Armour & Company as a site for a warehouse.

Two small tracts abutting on the water were leased for fish-houses, being the headquarters of fishing tugs doing lake fishing. It was obviously essential that the railroad should hold the title to those fish-house sites to conserve the use of its ore docks in the harbor.

The two coal docks and the merchandise dock were leased to firms or corporations which operated them. One of these firms had a small elevator on the property and carried on a merchandise business in coal, lime, cement and other building materials, and in feed and grain.

The leases to these parties excepted the tracks of the railway company which extended to all parts of the property, i. e., reached all the industries except the fish-houses, and the lessees in all instances paid the railway company a fair rental considering the value of the property occupied. In valuing this property, I find no practical way to deal with it except to treat it and value it as a whole, and to include it as a whole in the inventory of the complainant's real estate, and to include in the railroad earnings all the rents and profits derived by the railroad company from its tenants. I find that all of this land, including the appurtenant water rights is necessary and in use for railway purposes, the facts with refer-

ence to the water rights being essentially similar to the situation at St. Ignace.

Since the decision by the Supreme Court of the United States in Norfolk & Western Ry. Co. vs. Conolly, and Northern Pacific Ry. Co. vs. North Dakota, the question of how this property shall be treated becomes of minor importance, as all of it is devoted exclusively to freight use.

In the City of Houghton the complainant owns 1,500 feet abutting upon Portage Lake. The main use of this property is as a terminal. It is claimed by the defendants that the land should be valued exclusive of its water rights, and the water rights not included in the inventory of property as being in use for railroad purposes. Portage Lake connects the Cities of Houghton and Hancock with Lake Superior and with Lake Linden. At Houghton the complainant's railroad connects with the Mineral Range Railroad, which serves the Copper Country, so-called, consisting of a large part of Houghton County and all of Keweenaw County. The passage across Lake Linden is on a bridge. It is in evidence that, several years ago, this bridge was destroyed by a boat, and until a new bridge could be built, the only method of railroad connection between the large population of Houghton, and the important copper and other industries north of Houghton, was by scows which carried cars across and landed them upon the water front. It is in evidence that frequently this water front has been used for the reception and delivery of freight. It is the only point on Portage Lake where the complainant's railroad can make connections with the water, either for the reception or delivery of freight. Although these water rights were not in actual use while this case was being tried, the land to which the water rights were appurtenant was in use for railroad purposes, and the use of the water right

is liable to be required at any time, and I therefore think that the land, including the water rights may fairly be considered as in railroad use, or at least, necessary for railroad use, and so I find.

Trackage Rights in Streets.

In the complainant's inventory and appraisal of property is certain land lying on Lake Street (a public highway) in the City of Marquette, over which the complainant has, and exercises, under an agreement with the city, a right of way for the maintenance and operation of its railway. This agreement is a mere license which is liable to be terminated at any time by the grantor, but the complainant claims, nevertheless, that it is entitled to include the property so used, in its inventory and at a fair valuation, the same in all respects as if it belonged to it in absolute ownership. Against this the defendants claim that the complainant is entitled to value only its rights in this property; that its right in this property is a mere permit which may be revoked at any time, and which therefore has no determinable value, and should have no value assigned to it in this case.

The question thus raised depends upon the question as to what property it is, exactly, that the company is entitled to a return upon. If it is entitled to a return on only such property as is not only used by the company rendering the service, but is also owned by the company in absolute and complete ownership, the defendants are right and no value can be set down in the inventory on account of these trackage rights, as they are liable to be terminated at any time by the grantor, and therefore have no determinable value; but if the company is entitled to a return upon all such property as is used in the public service, although not held by the company in any greater ownership than such as gives the right of pres-

ent occupancy and use, then the property used in the exercise of these trackage rights should be inventoried and valued the same precisely as property that is both so used and so owned by the company.

On this question I find that the company is entitled to a return upon all the property that is used by it in the public service without regard to the ownership of the property so used. The all important thing that decides whether a given property is to be taken into consideration is, not the ownership, but the use of the property. It is the use that enables the company to perform the service; it is the use that the company sells to the public in performing that service; it is the use, and not the title to or ownership of the property that the public pays for, and it is the use, if anything, that is confiscated by the statute in question. That being the case, the question of the ownership of the property, i. e., the question as to who owns the property is of no consequence or even relevancy to this case. It would not be thought of as relevant to the case but for the fact that nearly all the property used is owned by the company, and also the further fact that, although ownership as regards personnel is of no consequence, ownership as regards value if of very great consequence, as it is the value of the full and absolute ownership of, or estate in, the property that the company is entitled to a return upon in whosesoever hands that ownership may be held. As the use which the company makes of the property is exclusive, it absorbs the rental value of full ownership, and as that rental or use value depends on the value of full ownership, it becomes necessary to determine the value of full ownership in order to determine the value of the use which the company is selling to the public—that value being the price which the public is required to pay. How the

company is able to furnish that use, whether by owning the property or otherwise, is immaterial to the public.

If it be said in this connection that this is a case of alleged confiscation and that the company can have no ground to complain of a confiscation of property that it does not own and that is owned by somebody else, the answer is that the confiscation complained of is not the ownership of property, but of its use. The State, by the action complained of, does not interfere with the ownership or possession of the property in question; what it does is merely to compel the company to give the public the use of the property for a compensation which the company says is so small that the use of the property is thereby confiscated.

In accordance with these views, I find that the property used by the company in the exercise of the trackage rights referred to is properly included in their inventory and that it should be appraised at the value of its full ownership. I find also that this property may be valued according to the value of nearby similar property, and I have so valued it. In my valuation of lands, I have included this right of way at a valuation of $27,023, of which $20,163 is allotted to freight; and $6,565 to common. Testimony was introduced by complainant to prove that this right of way was worth $30,000—the testimony being to the effect that the Lake Superior & Ishpeming Railway Company would willingly pay that amount for it, but I consider the above allowance sufficient and also conservative.

Complainant's inventory contains also another portion of right of way which resembles in some respects the portion above discussed and which is objected to by defendants on the same ground as the latter. It lies in the City of Ishpeming; is 1,250 feet long and occupies land which was formerly a portion of Canda Street. If

the principles above applied to the trackage rights in Marquette are correct, this portion of right of way is clearly includable at its full value even though it were a mere license revocable at will, and had been acquired without cost.

It is not, however, so held and was not so acquired. It was acquired and is held under an agreement with the City of Ishpeming by the terms of which the complainant is given in perpetuity the right to the exclusive occupancy and use of the land in question, in consideration for which the complainant obligated itself to purchase and give to the city other lands to be used as a part of Canda Street, which other lands, the testimony shows, were so purchased and given by the complainant. On these facts, I am unable to see any ground for claiming that this right of way was acquired without cost to the company or to see how it can,—for the purposes of this case, be distinguished from any other right of way owned and used by the complainant.

I have therefore included in the inventory this 1,250 feet of right of way, comprising four-tenths of an acre and have valued it at $4,800, all of which is allocated to common.

Mineral Values in Right of Way.

Throughout the city limits of the City of Negaunee, and from thence through the City of Ishpeming, and for some distance beyond, the main lines of the complainant traverse a well-known and very valuable iron ore formation. Besides these main lines, the complainant owns branch lines which are used to reach mines in operation, and are useful and valuable for reaching any mines that may be discovered in the district. The rights of way for all the lines referred to are perpetual and exclusive, and carry with them the right to the permanent main-

tenance of the surface. Throughout the City of Negaunee the ore is a soft ore which is only economically mined by allowing the surface to cave, following the removal of the ore, thus causing very considerable depressions in the surface. If a railroad lies over such an ore deposit and must be maintained, not only is it impossible to remove the ore which underlies the track, but it is impossible to remove the ore lying on either side of the track for very considerable distances, except at an expense which is practically prohibitive. There are now three main lines of railroad traversing the district. Of recent years it has been almost, if not quite, impossible to obtain the right of way across this district, except the carrier would agree to remove its track to another place if ore was discovered thereunder, which place it must itself acquire, and bear the expense of the removal of the railroad thereto.

Shortly before this suit was commenced, ore was discovered under a track of the complainant, and by agreement the Mining Company procured a new right of way, and at its own expense, transferred the railroad thereto, the distance being some 2.75 miles. The entire expense of this transfer and the cost of acquirement of right of way was fully proved in the evidence. In addition to the evidence of the actual cost of this piece of right of way, there was opinion evidence as to the price at which the other right of way of complainant could be acquired through this mineral belt, considering the value of the lands over which they ran and the probability of iron ore existing therein. The chief witness relied upon was Mr. Belden, who had not only purchased the right of way at private sale, but had acquired, by condemnation, right of way over similar lands in the district.

It is obvious that the right of way over this territory could not be valued by the value of nearby adjoining

mineral lands, because the complainant does not own the mineral, but simply an easement with the right of support. It is equally obvious that this right of way is far more valuable than the adjoining lands valued simply as farming or garden property.

The claim of the complainant as to the nature of these lands and the character of the formation was substantially confirmed by Mr. Allen, the State Geologist of Michigan. From his testimony, it appears that while in some parts of this ore formation the geologist would be more apt to expect ore than in others, that a valuable deposit might be found anywhere.

The character of the ore in the City of Ishpeming is different from that in the City of Negaunee, in that it is a much harder ore, and by leaving pillars of ore the ground may be supported so as to maintain a track, but this can only be done at a loss of 30% of the entire ore body.

The foregoing are undisputed facts and on them the question to be determined is, what value shall be given to those portions of right of way? Shall it be merely the surface value of the lands involved, or shall there be included also an allowance for the prospective mineral value?

Upon this question the defendants claim and argue as follows: "This mineral value is speculative". "Our proposition is that in a rate case values which are speculative merely cannot be included. If at any time it is developed that minerals do exist then is a sufficient time to take into consideration whether they shall be included in the value, but until they are discovered and found to be actually existing, there is no warrant under any circumstances for their inclusion."

This argument involves, I think, an erroneous theory of valuation. It assumes the existence in property of

two distinct and separable kinds of value, viz, a speculative and non-speculative value—a value that includes an element that is prospective because based on anticipation of future developments and a value that does not include such an element.

This assumption is not warranted by economic facts. There is and in the nature of things, must be in every valuation, an element that is prospective and therefore speculative, such a speculative element being nothing more or less than an anticipation or expectation of something to be realized upon in the future. Whether this expectation will in fact be realized is always more or less uncertain and to the extent that it is so, the value is speculative. There is no property the value of which is thus made up of two parts which can for any practical purpose be separated and designated respectively as speculative and non-speculative. The assumption made by the defendants that the value of the mineral prospects is entirely speculative, and that the value of the surface rights is entirely non-speculative is unfounded. The one value may be more of a speculative nature than the other, but the difference is only one of degree, and not of kind. Of course, the mere surface rights can be valued separately from the mineral rights, but the value thus given to the surface rights is itself affected by prospects and therefore speculative in various respects, among which is this very contingency of mineral development by reason of which when all mineral rights are thus reserved the surface rights are liable to become nearly or quite worthless in consequence of cavings resulting from the exercise of the reserved right to remove the minerals. There is also in the surface value a very considerable speculative element from the fact that some of the land has a prospective value for building lots, which depends on city growth.

The above quotation from defendants' brief is under the heading "Speculative Values not proper for Inclusion in Rate Cases." Further on in their brief they repeat this proposition and in argument thereunder shift their ground; they say

"The value of the mineral prospect is properly includable in eminent domain proceedings", but "In a rate case, however, the existence of the property being used must be proven as a fact and it is not sufficient to speculate upon the probability of the existence of property or its value. In other words, the railway company must make out a clear case, must show the property and the value which it claims to exist beyond a doubt."

It will be noted that under this same heading, the defendant previously argued that speculative values should be excluded because they are speculative; and that here it is argued that they should be excluded because they cannot be proved with sufficient certainty to satisfy the requirements of a rate case. It will be seen also that the latter argument involves an abandonment of the former. According to it, the question is one of the sufficiency of evidence rather than of kind of value, and the claim is that speculative values are so uncertain that they cannot be sufficiently proven in a rate case although they can be in a condemnation case, because it is said the requirements of certainty are greater in the former than in the latter; and in support of this position they say "it is not every value which is proper in a condemnation proceeding that may be included in a rate case; thus in condemnation proceedings the severance damages are proper to be taken into consideration while they are not properly added to the value of the property in determining the sufficiency of rates."

This clearly involves a confusion of thought between value and damages. The amount allowed to an owner for

severance damages in condemnation proceedings is so allowed not as an increase in the value of the property taken, but as compensation to the owner for a diminution of the value of his remaining property not taken. Such severance damages are in neither case "added to the value of the property", and the assumption that they are so added in a condemnation case, although they cannot be in a rate case is unawarranted and argument based thereon that speculative values are not includable in rate cases, although they are so in condemnation cases is therefore without force.

In addition to these two distinct grounds for the exclusion of mineral values, the defendants allege a third, as follows:

> "It is not as though the complainant were now called upon to acquire this property. It owns it and has owned it for a long period and its predecessors acquired it gratis from the State at a mere nominal figure (with the exception of 2-6/10ths miles acquired without cost to it). Under these circumtsances where the value of the ore or of the prospect of ore as now claimed did not enter into the cost of acquisition, it is unfair to the public to pay a return upon a speculative mineral value, the possibility for whose existence is remote."

If this argument were sound, and its statements of facts true, it would not only exclude all value for this right of way, but would also put an end to the case. It assumes that it is actual cost that determines the amount upon which complainant is entitled to a return, whereas such cost has not been shown in the case, except incidentally here and there, but on the contrary the case has proceeded entirely on the theory that the amount on which complainant is entitled to a return is present value

estimated on the basis of reproduction or replacement cost. The argument has no more or other application to mineral values than to other values. And as to its statements that this right of way was acquired gratis or at nominal cost, the evidence does not so show, but on the contrary does show that the 2-6/10ths miles referred to was purchased by giving in exchange for it another right of way which must be presumed to have been of at least equal value, since the purchasers were willing to pay for it the amount that it cost them to furnish the complainant's present right of way.

I have thus considered these three arguments at length because they were strenuously urged, but in my judgment all of the questions raised by them are effectually settled by the Minnesota rate decision where it is held that the kind of value to be determined is market value. Whatever elements of value are included in the market value of this right of way, as such value is shown by the evidence, must necessarily be included here. It is the judgment of the buying and selling public that determines the market value, and if that judgment is that the value of the property is enhanced by its mineral prospects, it is, in fact, so enhanced, whether such judgment is wise or foolish—whether the prospects do or do not justify the estimate of an enhancement of value.

Under the rulings of the Minnesota rate decision, it seems clearly to be my duty to find the market value of this portion of right of way and include it in the valuation without undertaking to analyze and differentiate between the different elements of value that enter into that market value. This I have done, as specifically explained in the detail of land values in Marquette County, and the value of lands there fixed through the mineral belt, I believe to be fair and conservative.

With this explanation relative to parcels of land hav-

ing special features, I proceed now to the general valuation of the complainant's lands.

I find the total value of the lands of the complainant in the State of Michigan, in railroad use, to be $1,780,239, of which amount $142,679 is the value of lands used exclusively in the passenger business, $1,025,228 the value of the lands used exclusively in the freight business, and $612,332 the value of the lands used in common freight and passenger.

Practically without exception, the allocation of the lands to the services was agreed upon between the parties to this suit.

The following is a schedule showing my valuations by counties and the allocations to the different services:

Counties	Pass.	Frt.	Com.	Total
Chippewa	$ 31,372	$ 34,501	$ 40,805	$ 106,678
Mackinac		47,863	41,630	89,493
Luce		549	5,818	6,367
Schoolcraft		7	3,118	3,125
Alger		38	4,252	4,290
Marquette	111,307	897,229	360,776	1,369,312
Baraga		6,757	17,419	24,176
Houghton		32,591	106,308	138,899
Ontonagon		4,317	25,125	29,442
Gogebic		1,376	7,081	8,457
	$ 142,679	$1,025,228	$ 612,332	$1,780,239

I have attached hereto an exhibit on which I have given the value as I find it of every parcel of land therein described, assigning the value to the different services according to the agreed allocation. In general, my exhibit in its descriptions is a copy of complainant's inventory of its lands in Michigan as contained in its Exhibit 1-C, but I have been obliged in some instances to change

the descriptions because I could not otherwise apply the testimony as to values. This statement is particularly applicable to the descriptions in the Village of Baraga.

I proceed to make such comments on particular valuations as seem to me desirable.

Lands in Chippewa County.—Sainte Marie Union Depot Company.

In this county is situated the property of the Sainte Marie Union Depot Company, which is controlled by the complainant railroad and the Minneapolis, St. Paul and Sault Ste. Marie Railroad Company by stock ownership, each owning one-half of its stock. The depot property is not operated for profit, but the owning companies share the expense of operation in proportion to their respective use thereof. It is agreed between the parties that one-half of the value of this property should be included in the complainant's inventory and appraisal as part of the property owned by it, and the lands of this depot company are therefore included in the complainant's inventory.

The value of this terminal property is very large and very much in dispute. To prove its value, the complainant produced John G. Stradley, who was and long had been a resident and real estate owner and dealer in that city, and who showed himself very familiar with the value of this and adjacent properties, he having himself purchased very considerable quantities of land in the immediate vicinity and adjoining the terminal property. Basing his judgment upon these purchases and his knowledge of sales of other nearby property, he fixed the value of the terminal property at approximately $198,000.

Witnesses engaged in the real estate business produced by the defendants fixed very much lower values, so much so that the defendants' claim that the value of complain-

ant's interest in this terminal property is much less than its cost when purchased by the Depot Company in about 1899.

It is undisputed in the case, however, that the property was acquired as the result of the efforts of the citizens of Sault Ste. Marie to establish the freight and passenger depot as a more convenient location, and that the citizens undertook to furnish part of the land, to raise some money to pay for land and that the prices were made very low by some owners as part of their subscription towards getting the depot moved. Notwithstanding these facts, the land cost the Depot Company $38,000.

Mr. Snell, a witness produced by the defendants, testified that property nearby the depot property increased from two to three times what it was worth before the depot's location was changed, and that notwithstanding that there had been a very considerable falling off in real estate values prior to the time that he testified, property nearby was still worth two or three times more than when the new depot was established.

In view of these facts, and the conflicting testimony, it is difficult to form an entirely satisfactory estimate of the value of this property. However, I think that a great part of the difference between the estimates is due to different methods of valuation—that the defendants' witnesses valued on the basis of what they judged the land would have to be sold for, if thrown on the market in bulk, the depot being removed, while the complainant's witnesses valued on the basis of what it would cost to acquire the property at market value, judging from values and sales of adjoining similar property. Of these two methods, I think the latter is more correct for the purpose of a rate case. I think also that Mr. Stradley had such intimate and thorough knowledge of property values in the vicinity as specially qualified him to judge of

this property, and that his valuation made on the above basis, although much greater than that made on the other basis, is fairer and more reasonable than the other. I think, however, that it is too high and after much careful consideration have decided to place the value of this terminal property at $137,741.

Other Lands in the City of Sault Ste Marie.

Besides the property of the Sainte Marie Union Depot Company which I have already considered, the value of the complainant's lands in the City of Sault Ste. Marie are much in dispute. I have had great difficulty in deciding upon these values. Mr. Stradley was the only witness produced by the complainant, while the defendants produced dealers in real estate whose values were radically lower. The method of valuation adopted by Mr. Stradley was substantially correct, that is, he undertook to apply the value entirely upon recent sales of nearby lands. I am not, however, convinced that Mr. Stradley had a sufficient number of sales to establish from such sales a fair average value of the railroad lands. On the other hand, it was evident that the witnesses for the defendants applied to the railroad lands wholesale prices as though these lands were in the market to be sold in bulk. After careful consideration of the evidence, I have fixed values which are materially lower than Mr. Stradley's and in some instances very considerably higher than those fixed by defendants' witnesses, but which, I believe to be conservative and fair to both parties.

Mackinac County.

In this county I have fixed the values as claimed by the complainant because the witnesses produced by the complainant were, in my judgment, better qualified to judge and possessed a more thorough knowledge of values than

those produced by defendants, especially in respect to land values in St. Ignace where the most valuable property of complainant in this county was located.

Luce and Alger Counties.

In these two counties there is no substantial dispute between the parties as to the value of the property.

Schoolcraft County.

I have fixed a value of $5.00 per acre for the rural lands in this county, which I believe is a conservative valuation.

Marquette County.

In the City of Marquette, I have, in general, followed the valuation fixed by complainant's witness, Mr. M. E. Asire, because I am convinced from the whole testimony in the case that by reason of large experience in the real estate business in Marquette, his intimate knowledge of local conditions affecting values there, and his evident desire to be fair that his valuations were reasonable and conservative.

I think, however, that in valuing item 29 in the City of Marquette, Mr. Asire's method of valuation was not upon correct lines and I have materially reduced his valuations of that item accordingly.

Mineral Lands in Marquette County.

I have already treated of the situation and complexities involved in the valuation of this property. The value of the ownership here involved is very hard to estimate. That ownership consists of two general rights, viz., the right of way over the surface and the right of support thereof, i. e., the right to protection against cavings, resulting from the removal of ore from under-

neath. The value of these two rights to the company and the public which it serves is necessarily the amount that it would cost to acquire them, provided that amount is not so great as to be prohibitive. Upon the question of the amount of that cost, we have only the testimony of Mr. Belden, a resident lawyer, who had had much experience in dealing with such rights of way and who based his estimates of value upon his knowledge of what it had cost to acquire other similar rights in the vicinity—a method of valuation which seems to be in substantial harmony with the principles laid down in the Minnesota rate decision. That Mr. Belden was as well qualified as anyone could well be to make such an estimate and that he was honest and fairly conservative there is no room for question. As Mr. Belden's is practically the only testimony on this particular subject, the valuation of this portion of right of way (unless mineral rights are entirely excluded) is to be made on the basis of his estimates and I have therefore made my valuations accordingly, but with certain reductions from his estimates made in order to be safely conservative. On all main line properties, I have adopted his value reduced by 25%.

With reference to all mine branches, I have fixed a value not exceeding $500 per acre. This I have done, not because there is anything tending to show that these lands could be presently acquired at less prices than those fixed by Mr. Belden, but because I doubt whether such prices would not be prohibitive—whether any railroad company could afford to, or would, pay such prices for any considerable quantity of land, the use of which would be confined to mine branches.

Baraga County.

With reference to the value of the lands in the Village of L'Anse, there was a sharp dispute between witnesses.

I have fixed values there which I believe are conservative, and give due consideration and weight to conflicting opinions.

In the Village of Baraga, I have, in general, adopted prices fixed by the witnesses for the defendants.

From the Village of Baraga to the Houghton County line, I have fixed values which are somewhat less than the weight of the evidence would perhaps justify. I have done this because I could see no good reason why these rural lands should be worth very much more than rural lands in Houghton County west of Nestoria or in Ontonagon County, the element of probable value as sites for lakeside or summer resort cottages seeming too remote for consideration here.

Land West of Nestoria in Baraga, Houghton, Ontonagon and Gogebic Counties.

The values which I have fixed on rural lands from Nestoria west to the Michigan and Wisconsin State line are such as do not, in general, exceed the value of nearby or adjoining stump lands, and those fixed by me in Ontonagon County are not greater than would, I think, be justified by the testimony of the defendants' witness, Mr. Garvin, with reference to lands in that county.

To my views on land valuations as above expressed defendants' counsel made numerous objections. To some of these objections I will, for the sake of clearness, make answer here. The answers to the others will be found in connection with the objections in the Appendix.

Insofar as defendants' counsel assert (Objection 5 a-1) that I allowed a strategic value for any lands, he is in error. No allowance was anywhere made for strategic value. On two parcels of land a special value was al-

lowed, as hereinbefore explained, but that special value was not on account of any strategic advantage, but on account of their special adaptation for railway purposes. It was a value which inhered in the land itself and would exist in the hands of any owner of the particular parcel of land, and which the owner would presumably receive on a sale, and certainly would be entitled to receive in condemnation for railway purposes.

Defendants' Objection 5 (a) (2) assumes that my findings include a value for riparian rights in lands whose reparian rights are not in railroad use. This assumption is incorrect. All of the riparian rights for which a value was included in my land valuations were found by me to be in railroad use in the manner and for the purpose specified in connection with those valuations.

The question whether the complainant would be entitled to include in its land valuations the value of water rights not actually used by it either for protection of water rights which it does use or otherwise, but which rights are cut off from actual use by the manner in which the lands to which they are appurtenant are put to railroad use, does not arise in this case, unless I am wrong in finding that the control of the water rights of all of the lands included is thus needed for protection.

Defendants' Objection 5 (a) (4) seems to intend to assert or imply that my findings undertake to determine and allow ore values, or values due to ore or other mineral prospects. If such is the intention, counsel are in error. The lands were valued at their market value as shown by the evidence. Whether any, or if so, how much of that market value was due to the existence of ore or ore prospects was not considered by me, and was not within my province for consideration. That my method of valuing lands having mineral prospects was correct I

think is fully sustained in *Montana Railway Co. vs. Warren*, 137 U. S. 348.

Defendants' Objection 5 (a) (5) asserts that my "land values, generally, are excessive and contrary to the weight of evidence." This objection is so extremely general that it is impossible to discuss it. The same is true, in varying degrees, of a considerable number of the objections which follow. This I very much regret, for the reason that I have been not only anxious to consider all supposed errors in my findings, and to correct all real errors, but anxious also to give full and fair consideration to every objection. But where the objection is of such general character I am able to do neither. There are one hundred and sixty-one separate descriptions of land embraced in the valuations, and as each is valued separately, there are hundreds of different "land values" to each and all of which this objection applies. Upon comparatively few of these specific parcels has there been any discussion in briefs or oral argument as to their value. Counsel on each side, in general, contented themselves with discussing the principles to be used in valuing the different classes of land. They respectively furnished me a list of lands with the value they claimed for each parcel, together with references to the testimony claimed to sustain their valuations.

I do not complain of this method of procedure because probably it was the only feasible one which would not make briefs and oral argument unreasonably long. It enabled me to consider the testimony with a fair probability of missing none that was material, and I have considered it. I saw each witness and I have used my best judgment not only in determining the witness or witnesses best qualified to establish the value of each particular description, but also in applying the testimony to each parcel involved.

Yet this objection asserts that each of the valuations is excessive and not supported by the testimony, and at the same time fails to state what the defendants claim that any of them should be. Such an objection it is clearly impossible to discuss. And if it could be discussed, it could not possibly be met, for if every valuation were reduced in response to it, such reduction might or might not be sufficient to satisfy the objection, because there is nothing to show what reduction the objection claims should be made.

Defendants' Objection No. 5 (b) (1) asserts that lands in considerable or large tracts are considered and valued upon the basis of adjacent or nearby lands subdivided into small lots and upon the basis of an immediate sale of the whole of such lands at the values or prices which were paid for a small number of lots out of a large number in the vicinity.

No lands were valued by me on the basis described in this objection. The lands were valued by me upon the proved market value of similar adjoining, adjacent, or nearby lands upon the assumption that it would cost the complainant that amount to presently acquire such lands either by purchase or condemnation.

Defendants' Objection No. 5 (b) (2) asserts that in my valuation the assumption is given effect that there would be an immediate demand, at high prices, for all of the South Shore lands now occupied by the railroad. No such assumption was either made or given effect by me.

It is asserted under subdivision (3) of the objection last named that

> "the detrimental effect of the railroad, as giving a lower value to lands in its immediate vicinity for other than railroad purposes, was not taken into account, in that the railroad lands were considered of the same value as, and compared with, residence and

high class property located in the better parts of municipalities where those lands lay."

I uniformly took into account the detrimental effect of the railroad upon the lands in its immediate vicinity, and the same is reflected in my valuations wherever such effect was found by me to be shown by the evidence.

Subdivision (4) of this objection asserts that

"principal and important streets in municipalities were assumed to be projected through and onto the lands of the complainant, and the further assumption was placed that there would be an immediate demand for all the railroad lands thus assumed to be on such streets for the same uses as the occupied lands now on such streets or in the vicinity."

None of my valuations were based on either of the assumptions mentioned. The objection could apply only to the passenger station property at Marquette on Front and Third Streets and property adjoining on the west, between Third Street and Fifth Street. The testimony as to the division of that property by the opening or extension of certain streets was considered by me only in determining that this property was similar to the adjacent and nearby property, and therefore comparable in value.

Subdivision (5) asserts that I adopted values which are based upon purchases for railway purposes, resulting in the inclusion of the values and elements of value for railway purposes forbidden under the Minnesota rate cases.

None of my valuations were based upon purchases which included values or elements of value for railway purposes which are forbidden by the Minnesota rate cases. In the two cases hereinbefore mentioned I did find that the lands had special value by reason of their adapt-

ability for railroad use. Such method of valuation is not forbidden by the Minnesota rate cases but expressly allowed.

There were other objections to my land valuations, but these are all that I consider it necessary to here treat.

Schedule 3.—Grading.

Under the general heading "Grading", the valuation engineers employed by the respective parties, following the classification laid down by the Interstate Commerce Commission for construction accounts, included a number of different items as follows: (1) Grading proper, being the cost of moving materials used in the construction of the roadbed, including earthwork, solid rock and loose rock; (2) clearing and grubbing; (3) corduroy; (4) riprap; and (5) retaining walls.

I follow their classification in making my findings. I have fixed the value of the items contained in this schedule and also of all succeeding schedules, as of June 30, 1913, that being the latest date on which figures have been submitted to me.

Grading.—The Riggs and the Hansel estimates of quantities of materials moved in grading are not far apart, Hansel's figures being somewhat less than those of Riggs on earthwork, but somewhat greater on rock. There is also a difference between them, due to the fact that Riggs estimated grading quantities on all branch lines, while Hansel estimated no grading quantities on those branch lines the grade of which is not owned by the complainant. If the grading quantities on such branches are deducted from the Riggs' 1913 totals as is conceded by the complainant should be done the total of Riggs' grading quantities including earthwork, solid rock, loose rock, shrinkage, overhaul, grading on crossings, depot grounds, etc., would be 7,651,461 cubic yards. The Hansel

total for the same items is 7,557,800 cubic yards. It appears from the testimony, however, that subsequent to the Hansel appraisal there was a large amount of earthwork added to the complainant's road by the filling of a number of trestles, the added quantities by reason of the filling of these trestles being 131,500 cubic yards. If this yardage is added to the Hansel 1912 estimate to reach the correct figures for 1913, the grading quantities, as found by Hansel, would be 7,689,300 cubic yards, or considerably in excess of Riggs' as corrected.

I have therefore taken the grading quantities as found by Riggs in 1913, corrected by deducting for branches, the grade of which is not owned by the complainant, and I find the quantities to be as follows:

	Cubic Yards
Earthwork, including shrinkage, overhaul, grading crossings, etc.	7,404,489
Solid rock	67,628
Loose rock	179,344
Total	7,651,461

Mr. Riggs and Mr. Hansel agreed as to the proper unit prices for solid rock and loose rock, but differed as to the unit price on earthwork. Mr. Riggs used a unit price for earthwork of 30¢ a yard, while Mr. Hansel used a price of 20¢ for sand; 40¢ for earthwork at sink holes, and 26¢ for other earthwork, his average price being 25.6 cents. All the other witnesses who testified on this point, agreed that 30 cents a yard was a fair and conservative price for earthwork in the territory through which complainant's railroad runs, where, on account of the rugged country, the short working season, and the severe climatic conditions, the cost of the work would be much greater than in most other parts of the country. For instance, Mr. Hogeland, the chief engineer of the Great Northern Railroad, testified that while the average price of such

work on that road was 19.3 cents a yard, yet the average price of such work in Northern Minnesota, a country very similar in physical and climatic conditions to the Upper Peninsula of Michigan, was 36¢ a yard.

Mr. Loweth and Mr. Young, both of them with large experience in construction work in the Upper Peninsula of Michigan agreed that 30¢ a yard would be a reasonable price for this work.

In view of all the testimony which corroborates Mr. Riggs' estimate of the proper unit to be used, and in view of the fact that the Hansel price is supported by the testimony of no other witness, and the only basis for the same, as shown by the record, is his opinion, based on his own experience, none of which experience, as admitted by him, was gained from work in the Upper Peninsula of Michigan, I find that the Riggs' price for earthwork should be adopted, and I have adopted it, together with his prices for rock, which agree with those of Hansel.

The valuation of this subdivision of the schedule, with the allocations to the different services is as follows:

Freight	$ 204,381
Common freight and passenger	2,197,937
	$2,402,318

Defendants' Objection No. 5 (c) (3) asserts that I "assumed that to reproduce the earth grading upon the complainant's line and right of way would cost thirty cents per cubic yard, whereas the true cost to reproduce, and the real reproduction value, is much less, and does not exceed an average of twenty-five cents per yard."

"The price adopted for grading is higher than prices paid by the South Shore on its line in recent years, and higher than that shown by the majority of bids on twenty-five miles to be constructed for the Chicago, Milwaukee and St. Paul in the vicinity."

I assume that where this objection says I "assumed" that to reproduce the earth grading upon complainant's right of way would cost 30¢ per cubic yard, it was meant to say that I "found" that to be the cost—the fact being that I found from the testimony that such would be the cost, and in connection with such finding, discussed the testimony on which the finding was based. That finding is now objected to on the ground that it is "higher than prices paid by the South Shore on its line in recent years, and higher than that shown by the majority of bids on 25 miles to be constructed for the Chicago, Milwaukee and St. Paul Ry. in the vicinity, and it is claimed that because certain grading had been done on these roads in recent years at a less cost than 30¢, the allowance here should be much less than 30¢, and should not exceed 25¢—in other words that those specific instances of a less cost than 30¢ outweighs the opinion evidence of all the witnesses except Mr. Hansel, and requires the fixing of a price lower even than that fixed by the latter.

To judge of the validity of this claim it is necessary to examine these specific instances of cost and inquire whether they are entitled to such weight as evidence of the average cost of grading the complainant's entire line. I find in the testimony proof of only three contracts for grading, viz: one in 1904, where the price was 26¢ for earth and 40¢ for hard-pan, one in 1907 and one in 1909, in each of which the prices were 35¢ for earth and 50¢ for hard-pan. I assume that these are the contracts referred to in the objection, but am unable to see in these contracts any tendency to prove that the allowance of 30¢ is too high, especially as that allowance includes the moving of hard-pan. The other piece of work probably contemplated by the objection and mentioned as having been done on complainant's road, is the 2.6 miles of new road constructed by either the Cleveland-Cliffs Iron Company

or the Lake Superior & Ishpeming Railway in 1911, and afterwards turned over to the complainant. The grading on this piece of road was done at a cost of 28¢, including some rock. To what extent the cost of grading this small piece of roadway should be taken as proving what would be the average price of grading the complainant's entire line would depend on the extent to which the conditions affecting cost are the same in the two instances. As regards the identity of those conditions, there is no direct testimony, but some indirect. This particular grading was done under the direction of the witness, Mr. Young, he being the chief engineer of the Lake Superior & Ishpeming Railway; and he must therefore be regarded as the most competent person to testify as to the identity of conditions and the consequent extent to which the cost in this instance can be taken as proving the average cost on the entire line. He does not, in his testimony, compare the conditions in question, but he states by necessary inference that the grading cost in this piece of roadway is not to be taken as showing the average cost on complainant's entire line. In answer to a specific question calling for his opinion as to the average cost of grading the entire line, he fixes that price at 30¢. There is no question of Mr. Young's fairness and reliability, and I am satisfied that the difference of 2¢ between this specific cost and the 30¢ average cost is due to differences in conditions. Certainly the specific instance of cost cannot be allowed to outweigh both Mr. Young's testimony and that of all the other witnesses except Mr. Hansel. The other specific instance of grading cost referred to in the objection is similar in effect to that last mentioned,—the engineer under whom the work was done being a witness in this case and testifying that the average cost of grading on complainant's entire line would be 30¢ or more; and

in this instance, the witness testified as to the identity of conditions, to the effect that they were not the same, and explaining that the price there paid was exceptionally low for reasons which he mentioned.

After a careful examination of the objection, I am unable to come to any other conclusion from the testimony than that I have hitherto expressed.

Clearing and Grubbing.—Of the 419.61 miles of main line right of way owned by the complainant in Michigan, it appears undisputed from the testimony that with the exception of 14.88 miles of open swamp, the entire right of way in its original construction required clearing and grubbing.

Messrs. Riggs and Hansel, the engineers employed by the complainant and the defendants, respectively, on the reproduction theory, felt compelled to estimate clearing and grubbing, not upon the amount which was originally required in the construction of the road, but by an estimation of the amount which would now be required, based on the condition of the lands adjoining the right of way.

On this method, Mr. Riggs, for the complainant, estimated that 85% or 4,098.42 acres of main line, outside of cities and villages, would require clearing, and that 40% of the cleared area would require grubbing, the combined cost of which he estimated at $80 per acre for the acreage above named, being $40 an acre for clearing and $100 an acre for grubbing.

Mr. Hansel, in his inventory, estimated considerably less quantities both of clearing and grubbing, although he agreed with Mr. Riggs in the unit prices which should be applied.

In January, 1914, Mr. Cadarette went over the entire main line to determine the exact conditions of the road as to the amount of clearing and grubbing which would be required on a reconstruction judged by the condition

of the lands adjoining the right of way. He testified that of the 419.61 miles of main line, 40.83 miles were cleared in cities and villages, 39.22 miles were cultivated or capable of cultivation, 14.88 miles were open swamp, and 324.68 miles would require clearing and grubbing. The acreage, therefore, requiring clearing at that time, at 12 miles to the acre, was 3,896.16 acres.

I am convinced that Mr. Gadarette's investigation was carefully and correctly made, and I accept its results as to the number of acres upon which clearing must be estimated.

When we come to the question of grubbing, we find a disagreement between the engineers as to the proportion of the cleared area requiring grubbing. Mr. Riggs' estimate was that this percentage would be 40%. Mr. Hansel gave no percentage but by comparing his allowance for the number of acres requiring grubbing with his acreage allowance for clearing, we find that his area requiring grubbing was 29.88% of his acreage requiring clearing.

I am not satisfied that the Riggs' estimate of the percentage of grubbing required is any more correct than that of Hansel, and I have adopted the Hansel percentage of 29.88% which I have applied to the 3,896.16 acres requiring clearing as found by Cadarette and adopted by me. This acreage requiring grubbing would be 1,164.17 acres.

Mr. Riggs computed clearing and grubbing on branch lines in the same manner as for main line, except that he estimated a 50-foot instead of a 100-foot right of way, making an acreage of six acres to the mile.

I have not been able to accept the estimates of either Riggs or Hansel on the clearing and grubbing on branch lines, as the figures of both are excessive. On some of the branches which they included, the grade was not

owned by the complainant; other branches are in territory where I have valued the right of way as improved lands, being branches in cities and villages, and the mining district. This leaves only four branches on which I have allowed clearing, viz: the Fiborn Quarry, Hunter, Arnheim and Bessemer branches, with a total acreage of 70.55 acres of which acreage 29.88% or 21.08 acres would require grubbing. I have figured clearing and grubbing on this acreage at the same prices used on the main line.

The theory on which the complainant claims this allowance for clearing and grubbing is that the land in the right of way should be valued on the basis of reproduction cost, and that such cost is to be ascertained by estimating the cost of acquiring the land in the uncleared and ungrubbed condition in which the adjoining lands now are, but without timber value, and adding thereto the cost of clearing and grubbing.

The theory on which the defendants claim that no allowance for clearing and grubbing should be made is that under the decision in the Minnesota rate case, the lands in the right of way cannot be valued in this way; that the Federal Supreme Court there laid down a general rule on this subject which restricts the value of the land in the railroad right of way to a certain maximum, such maximum being the value for other purposes of adjacent or nearby lands of a similar character, and that the right of way in question must therefore be valued on the basis of the value for other purposes of the agricultural lands in the vicinity that have been cleared and grubbed, even though that value might, in many instances be much less in amount than the cost of clearing and grubbing alone. According to this claim, it will be noted clearing and grubbing is not to be treated as an item of cost in the construction but as work that had been

done on the land previous to its acquisition and the cost of which, therefore, has been merged in the land value and been paid for in the amount paid for the acquisition of the land.

Which of these claims should be sustained? What we are here trying to do is to estimate the cost of reproducing the property; and for that purpose we are employing a hypothetical reproduction; and the precise question raised by these claims is whether in such hypothetical reproduction we are to assume that the land on which the roadway is to be constructed is in a state of nature or other condition requiring it to be cleared and grubbed or that it has been already cleared and grubbed.

The complainants assume the former; the defendants the latter. Which of these assumptions is correct? Take, for example, a certain mile of the complainant's railroad, running through a forest or through cut-over lands—in estimating its reproduction cost by means of a hypothetical reproduction, which of these two kinds of land is to be taken for the right of way? Or, to put the question in another way, which lands are to be taken and treated as the "similar lands" contemplated by the Minnesota rate decision? There are many kinds and degrees of similarity, and all lands are similar to all other lands in many respects. The lands of the complainant's right of way are similar to both of the two kinds mentioned—similar to the adjacent lands in some respects, and they are similar to the nearby farm lands in other respects, and in many respects they are similar to both. It is evident, therefore, that the similarity contemplated by the Minnesota rate decision is a particular kind of similarity, and it is also evident that it must be a similarity which produces similarity of value—it must be a similarity in respect to those things that determine value.

Now, when we compare the 12 acres in any given mile

of the right of way in question with a similar quantity of nearby farm lands, we find that in respect to the qualities which determine the value of each there is no similarity but a very decided dissimilarity. The qualities which determine the value of the parcel of farm lands are productiveness of soil and convenience of shape for agricultural purposes. On the other hand, these two qualities which are of such value to the farm lands are of no value whatever to the right of way, the first is of no advantage and the second is not only of no advantage, but is a distinct disadvantage.

Turning now to the qualities which determine the value of the land in the right of way, we find that the one all-important quality is its shape and that this same shape which renders it most valuable for a right of way, renders it unavailable and practically valueless as farm lands. The only point of similarity between them that helps to determine value is that both have been both cleared and grubbed and in that respect, they are similar only as regards a part, viz., two-fifths of the right of way—the residue of the right of way being cleared but not grubbed. And this point of partial similarity, it should be noted, is something that does not pertain to the land in a state of nature, but is an improvement made by the hand of man, while the respects of dissimilarity, quality of soil, and extent of length pertain to the land in a state of nature.

On the other hand, in respect to the qualities which determine the value of the land as right of way, the similarity between the land in the right of way and the parcel of adjacent uncleared and ungrubbed land supposed to be taken is complete. The land to be so taken is presumptively the same in all respects as that in the existing right of way, except in respect to the improvements that have been made on the latter; and in estimating the reproduction cost of the right of way lands in

their present condition, it is proposed to take the cost of acquiring land in the state of nature that the adjoining land now is, and add to that cost the cost of making the existing improvements.

That the amount of these costs will be a truer estimate of the cost of reproducing this parcel of right of way cleared and grubbed than would the estimated value of a twelve acre parcel of farm land in the vicinity, cleared and grubbed, there can, of course, be no question. Hence, if this parcel is to be valued on the basis of reproduction cost, the former rather than the latter amount must be taken and the cost of clearing and grubbing must therefore be allowed.

But it is claimed that this parcel of right of way as cleared and grubbed cannot be thus valued on the basis of reproduction cost, that the ruling in the Minnesota rate decision forbids such valuation and requires that it be valued on the basis of the average market value of cleared and grubbed farm lands in the vicinity, and as that value is to be determined by actual sales of such lands, the amount that it would cost to reproduce this parcel of right of way in its present condition as regards clearing and grubbing is entirely irrelevant. In view of this claim, the question of clearing and grubbing becomes entirely a question of the construction of the Minnesota rate decision. Does this decision lay down a rule of valuation that requires this parcel of cleared and grubbed right of way to be valued as claimed by defendants, viz., at the market value per acre of similar cleared and grubbed farming lands in the vicinity? I am unable to see in that decision any intention of laying down any definite rule of land valuation; and I cannot conceive of there having been an intention to lay down the rule that a parcel of land in the cleared and grubbed portion of a railroad right of way is to be valued on the basis of the

value per acre of the same quality and quantity of cleared and grubbed farming lands in the vicinity. There is no relationship or similarity between the two parcels that would make the value of the latter a criterion of the value of the former; on the contrary, the fact is, as already noted, that the qualities which determine the value of the one are qualities which have no effect upon the value of the other, and the values are therefore not comparable. Moreover, if the court did intend to lay down such a rule of valuation, they certainly intended it to be applied only in cases where its application would be reasonable. In the present case, its application would not only be unreasonable, but impossible. It would be so because there are no similar parcels of cleared and grubbed land from which to obtain the average value required for that purpose. There would be no such similar parcels even if this entire parcel of right of way were uniformly cleared and grubbed; and still less would there be such when as is the case here, the parcel of right of way is not all cleared and grubbed, but as regards clearing and grubbing consists of three distinct parcels, viz., a parcel 40 feet in width and a mile long that has been cleared and grubbed and two other parcels, each 30 feet in width and lying on each side of the wider parcel, and each being cleared but not grubbed. To value such a portion of railway property in the manner claimed to be required by the Minnesota rate decision would seem to be a manifest impossibility.

Furthermore, the language of the Minnesota rate decision relative to this subject refers, as it seems to me, to land in its primary and limited sense, i. e., land in a state of nature without improvements; and if that is true, it is decisive of the matter in question, as the land value there would be limited accordingly and the value of the property in its present condition would be determined by

adding to that land value, the estimated cost of clearing and grubbing as proposed to be done in this case.

It is with this understanding of the Minnesota rate decision and of the meaning of the word "land" that I have fixed the land values in the rural right of way in this case where clearing and grubbing would presumably be required in order to reproduce the right of way in its present condition—the word "land" being there taken to mean land in a state of nature or cut over or stump land.

The value fixed by me for clearing and grubbing on main line right of way is $272,263.00 made up of the following items: 3,896.16 acres of clearing at $40 per acre, $155,846; 1,164.17 acres of grubbing at $100 an acre $116,417. This amount is allocated between freight and common freight and passenger as follows:

Freight	$ 5,202.00
Common Freight and Passenger	267,061.00

the allocation to freight being for freight spurs and side-tracks within the main line right of way.

The valuation placed by me for clearing and grubbing on branches is $4,930, all allocated to freight.

Rip-Rap.—Mr. Hansel inventoried rip-rap on complainant's road in Michigan at $4,110, while Mr. Riggs, through oversight failed to include any rip-rap. It is agreed that the rip-rap is there as an element of value, and I have included it at the Hansel figures, and assigned it to the common freight and passenger service.

Corduroy.—Riggs and Hansel agreed as to the mileage of corduroy, but differed as to the proper unit price. Hansel's price being the lower, I have adopted the Hansel price, and his total value of $10,000 and assigned it to the common freight and passenger service.

Retaining Walls.—The difference between the parties on this item is due to the difference in estimating the

cost of reproduction. Mr. Riggs' estimate was of reproduction in kind, while Mr. Hansel's estimate was that some of the stone walls could be reproduced in concrete at less cost. I have adopted Mr. Hansel's views, and therefore his figures of $73,093 for this item.

The allocations are as follows:

Passenger	$ 393
Freight	63,924
Common Freight and Passenger	8,776

Allocations.

I find that the valuations of all the items under Schedule 3 should be allocated to passenger, freight and common, as follows:

Passenger	$ 393
Freight	278,437
Common freigh and passenger	2,487,884
Total	$2,766,714

Schedule 5.—Bridges, Trestles and Culverts.

This is a very long and complicated schedule with many hundreds of different items, and a comparison of the three appraisals is most difficult. Yet as between the 1913 figures claimed by the complainant, and the figures for the same year claimed by the defendants in their latest brief, at page 166, there is a difference of only $4,346, the complainant claiming $455,535 and the defendants claiming $451,189. I do not find that the Riggs estimate, on which the complainant's claim is based, has been shown to be any more accurate than that of Hansel. I, therefore, have adopted the valuations and allocations claimed by defendant. For this valuation Hansel's 1912 estimate is used for a basis, the value of certain timber

reinforcements is added and structures replaced after Hansel's appraisal are deducted at Hansel's figures and the cost of the replacement added at Riggs' 1913 figures for the new structure.

The allocations are as follows:

Freight	$ 12,949.00
Common freight and passenger	438,240.00

Schedule 6.—Ties.

The two appraisals do not differ materially as to quantities of ties, Hansel's quantities being slightly in excess of those of Riggs. I have taken Riggs' quantities, corrected by deducting his estimate of ties on the branch lines, above referred to under Schedule 3, which are not owned by the complainant.

The principal difference between the two appraisals is as to the percentage of condition. In my judgment the weight of the evidence supports Mr. Hansel, and I have therefore adopted his percentage of condition, 55%, rather than the higher estimate of Riggs.

Both engineers agree on a unit price of 40 cents, that being the average price paid by the complainant for all ties purchased during the latest five-year period, 1909 to 1913, including an allowance of 7 cents per tie for inspection and handling.

Defendants, under their Objection No. 5 (c) (4), criticise my use of 40 cents as the basic price for ties, although this is the price that their own witness, Mr. Hansel, fixed. Mr. Riggs, the engineer of the complainant, in his 1911 appraisal, used a lower price, but in his 1913 appraisal he used 40 cents and testified that in his judgment that was the proper price. So unless there was some mistake made by these engineers, this price is

not fairly to be considered in dispute. Defendants claim that Mr. Hansel did make a mistake, viz: they say, in effect, that he found the average cost of ties for the years 1908 to 1912, inclusive, from the reports of the complainant to the Michigan State Board of Assessors, to be 33 cents, and then added 7 cents thereto to cover inspection, loading and transportation, when in fact the cost of inspection, loading and transportation were already included in the report cost. These reports I have examined, and I find that they purport to show the cost at the distribution point ,and that they show that the true average cost at that point for the years 1908 to 1912, inclusive, was 33.07 cents, and to 1913, inclusive, was 33.22 cents. The question whether this cost covered inspection, loading and transportation depends on the rules of the Interstate Commerce Commission, in compliance with which the accounts of the complainant are kept, and on examination of those rules I find that the price reported is not required to cover loading or transportation, but that it is required to cover inspection. The cost of inspection is shown by the evidence, without dispute, to be one cent per tie. It appears that in fixing the price at 40 cents Mr. Hansel did make a mistake to the extent of one cent, and I have therefore adopted the basic price of 39 cents instead of 40 cents, and have corrected my finding accordingly.

I find the allocations to be as follows:

Freight	$ 27,544
Common freight and passenger	258,918
	$286.462

Schedule 7.—Rails.

The chief differences between the parties on this schedule are as to the unit price and the percentage of condition.

The difference in unit price results from a difference in the method of computing freight rates. Mr. Riggs assumed that the rail would all be delivered at a central yard at Marquette, at a freight rate of $2.35 per ton. Mr. Hansel assumed that the rail would be delivered by water or rail to different parts of the line at an average rate of $1.60 a ton. I am not satisfied that the complainant has met the burden of proof in this regard and have therefore adopted Hansel's unit price of $30.30 a ton. Also it is my judgment that the Hansel method is the more correct for determining the percentage of condition and I have, therefore, adopted on this schedule his figures, corrected by adding the tonnage of rail added to the road after Mr. Hansel's appraisal.

I find the allocations of the items in this schedule to be as follows:

Freight	$ 132,166
Common freight and passenger	1,038,829
Total	$1,170,995

Schedule 8.—Track Fastenings.

I find the total present value of the items in this schedule to be $171,693. I find the allocations to be:

Freight	$ 19,201
Common freight and passenger	152,492

There is no dispute between the parties on this schedule.

Schedule 9.—Frogs, Switches and Crossings.

I find the present value of the items in this schedule to be $123,060. The allocations are as follows:

Passenger	$ 941
Freight	62,074
Common freight and passenger	60,045

There is no dispute between the parties on this schedule.

Schedule 10.—Ballast.

The estimates of the two engineers on this schedule differ as to quantities, unit prices and percentage of condition.

It is claimed by defendants that Mr. Riggs' quantities of gravel ballast per mile are excessive, in that he took the same average thickness as did Mr. Hansel, but failed to allow for the cubic contents of the ties. I find that such is the fact and have therefore taken the gravel quantities per mile found by Hansel and applied them to the graveled portion of the 1913 mileage, and have taken the Riggs' quantities of sand and cinder ballast per mile (the same being less than those found by Hansel) and applied them to the portion of the 1913 mileage that is ballasted with sand and cinders, after deducting therefrom the branch lines, the grade of which is not owned by complainant. I have adopted the unit prices used by Mr. Riggs, which are lower than those of Hansel.

Depreciation of Ballast.

Having determined the quantity of ballast and its cost of reproduction new, we come to the question of its present value, involving the much mooted question, Does Ballast Depreciate? Upon this question the principal expert witnesses for the respective parties are in flat con-

tradiction—Mr. Riggs, for the complainants, saying that ballast does not depreciate and that it should be carried in the inventory at reproduction cost, and Mr. Hansel, for the defendants, saying that it does depreciate and that the cubic feet of ballast now in complainant's railroad is so depreciated from conditions new that its present value is $107,000 less than its reproduction cost.

In this dispute there are two distinct questions involved: First, the general question above mentioned,—Does ballast depreciate? and second, the particular question, If ballast does depreciate, has the ballast that is now found to be in place in complainant's railroad depreciated from condition new, i. e., from the condition that it was in immediately after it was put in place?

The first question depends on what precisely is here meant by the word "ballast". The name "ballast" is applied indiscriminately to ballasting-material in all its various conditions and places, in the pit, loaded in cars for transportation, deposited beside the track at the point of proposed application, and finally placed in position under and between the ties of a railway. Now it is evident that in the three first of these conditions, ballast does not undergo a change that causes depreciation. But whether it does so or not is immaterial here as the depreciation alleged is a diminution in the value of the ballast which it is claimed takes place after it has been placed in the fourth condition and one that must therefore result from a change that takes place after the ballast has been applied and while it is still in place. Does ballast, while it remains in place in a railway, suffer such change and if so in what precisely does that change consist? Mr. Hansel (on whose testimony the claim of depreciation is based) says that such change does take place and states specifically what it is as follows:

"Ballast is somewhat peculiar in its relation to up-

keep, in that it is a never ending cost of up-keep of the track; there is no time in the working season between the time of frost going out of the ground, and the danger, the imminent danger of frost coming into the ground that ballasting is not being carried on even in the very best conditions; there is a constant flow into the property of ballast all the time; it disintegrates, blows away and settles into the embankment, perhaps owing to the character of the soil, it may settle into the earth beneath it, but other classes blow away and are carried away by the elements so that there is a constant stream of up-keep there all the time, and yet it cannot be up to a hundred per-cent."

According to this testimony, then, the change which is suffered by ballast in place or position and which causes depreciation takes place in three ways; viz., by sinking into the embankment, by being carried away by the elements, and by disintegration. Now that some portions of the ballast in a railway do sink into the ground and some are carried away by the elements and that a diminution in value is thereby caused is undoubtedly true, and if this diminution of value can properly be called depreciation and treated as such, then ballast does depreciate.

But can it properly be so called or treated? Depreciation is a diminution in value of a particular thing. It is the difference between the present value and a previous higher value of that particular thing. Now the particular thing under valuation here is the ballast that is now actually in the roadway. If there was formerly a greater quantity there, some portions of which have been lost, that fact alone does not lessen the value of the quantity which remains and which alone we are now valuing. The reproduction cost which we have determined and to which the depreciation, if any is found, is to be applied, is the

reproduction cost of the ballast now actually there, and not the reproduction cost of any larger quantity that may be supposed to have been there formerly and before any was lost. This fact the witness seems to have lost sight of. He apparently assumes that the ballast now there is the residuum of a larger quantity that was formerly there and that in order to reproduce the quantity now there, it will be necessary to first reproduce the former large quantity and then assume that larger quantity to have been reduced by the elements to the quantity now there. Now, this may be a proper line of reasoning if consistently adhered to; but in order to be so, the reproduction cost which is to be reduced by depreciation must be, of course, that of the larger quantity and not that of the smaller. But the witness does not pursue this course—does not determine the reproduction cost of the larger quantity and apply to it the depreciation which he finds to have resulted from diminution of quantity, but instead, he determines only the reproduction cost of the quantity now there, and applies to it the depreciation found to have resulted from the diminution in the larger quantity. This, it is clear, is a mis-application of depreciation in the process of determining present value from reproduction cost.

It is clear also that the question whether this diminution in value resulting from diminution in quantity can be treated as depreciation depends on what it is that is depreciated, and that it can only be treated so when it is the reproduction cost of the larger quantity as it existed before the diminution took place that is taken as the basis from which to determine present value. This being so, it is evident that it is of no consequence here whether ballast can or cannot properly be said to depreciate from diminution in quantity for in either event, the result would be the same, because the reproduction cost

of the ballast now there, undiminished by depreciation, would be the same as the reproduction cost of the larger quantity diminished by the diminution in value resulting from the diminution in quantity.

Unless therefore the ballast now there has depreciated from some cause other than its diminution from a larger quantity formerly there, it has not depreciated at all and its present value is its reproduction cost. Has it depreciated from any other cause?

The only other cause assigned by Mr. Hansel is disintegration, and it remains, therefore, to consider whether it has depreciated from disintegration.

Disintegration is the breaking up of integers into smaller ones. The integers of which ballast consist are bits of stone and grains of sand. Each of these is itself the product of disintegration—the product of rock disintegration caused by the action of the elements. Each represents a stage in that slow geological process by which solid rock is gradually reduced to fine particles of dust, each is slowly progressing toward that ultimate goal. This being so, it is undoubtedly true that there is at all times some disintegration going on in the particles of stone and sand which form the ballast of a railroad bed. But this disintegration is extremely slow and slight, so slow and so slight as to render it impossible to measure or estimate the extent of disintegration that would take place between the time of ballasting and that of reballasting a railway. It would be a manifest impossibility to make at any given time, any rational estimate of the extent to which this process of disintegration had gone forward between that particular time and the time when the ballast was placed there, further than to say that it was practically infinitesimal. And it would be still less possible to make a rational estimate of the de-

preciation in value, if any, that had resulted from such disintegration.

Returning, for a moment, to the question of depreciation in value resulting from diminution of quantity—the impropriety of placing a depreciated value per unit of measurement on a certain quantity of ballast merely because it is not a greater quantity is so manifest that, in fairness to the witness, the reason given by him for so doing should be noted. At pages 1164-5 of his testimony, he says:

> "If the D. S. S. & A. property was today for sale as a going property and if I was called in to tell the proposed purchaser what they would have to spend to put that in hundred percent condition I would have to include something for ballast and that something would be the sum I have set forth here as near as I can judge."

In other words, because it would cost the proposed purchasers a certain amount to add a certain quantity of ballast to the quantity that is there now, therefore, in determining the value of the quantity that is there now on the basis of reproduction cost, it is necessary to reduce the amount of its own reproduction cost by the amount it would cost to add the additional quantity. Whatever propriety there might be in advising a proposed purchaser as stated, there clearly would be none in thus figuring present value on the basis of reproduction cost.

In accordance with the foregoing views, I find that ballast wherever exposed to the action of the elements depreciates slightly from disintegration but that the depreciation from this cause occurring in the ballast of a railway between the time of ballasting and that of reballasting is so slight as to be practically inappreciable;

that the ballast that is placed in the bed of a railway gradually diminishes in quantity by the sinking of portions of it into the ground, and by other portions of it being carried away by the elements, in consequence of which new ballast is required to be added from time to time, but that this diminution in quantity does not diminish the value per cubic yard of the ballast which remains in the road; that the ballast now in the complainant's road has not suffered appreciable depreciation from either of the causes assigned, and that its present value is the amount that it would cost to reproduce it.

I find the allocations of the items in this schedule to be as follows:

Freight	$ 39,393
Common freight and passenger	570,874
Total	$610,247

Defendants' Objection No. 5 (c) (6) relates to the Schedule "Ballast", and the statement is there made that I determined that ballast does not depreciate. This statement obviously is erroneous. I found that ballast does depreciate, precisely as Mr. Hansel said it did: that is, in three ways, viz: by being blown away, by sinking into the embankment, and by disintegration.

Assuming that ballast does depreciate in these three ways, it is only such depreciation as results from the third way, viz: disintegration, that could be allowed for here, as the ballast valued in the inventory is only such ballast as was found in place at the time of the inventory and as it was all there in place, it could not be depreciated by being blown away or by sinking into the embankment. Whatever ballast had gotten out of place in either

of these ways was omitted from the inventory. It follows, therefore, that the ballast contained in the inventory could have depreciated only by disintegration, and I find that there is no testimony showing any amount of such depreciation, and that, in the nature of things, there could be no such testimony, as the depreciation from this cause between renewals of ballast would be too slow and slight to be appreciable, and that it would not be possible for anyone to determine, by examination or otherwise, what amount of depreciation, or that any amount, had occurred from that cause since the ballast was put in place.

Schedule 11.—Track Laying and Surfacing.

This schedule does not embrace any physical property. It consists entirely of labor, viz., the labor of placing in position and fastening the rails and ties, aligning them and providing for them a uniform or uniformly graduated surface on which to rest.

The practical details of this labor are described in the testimony of Mr. Riggs, as follows:

> "After you get the gravel ballast shoved off on each side of the track, it has to be put under the ties. Before it is put under the ties, the material that is between the ties must be removed. In my computations of track laying, and in actual railroad usage, it is usual to skeleton surface or half-surface the railroad that is to be ballasted immediately with the material that the bank is made of, and sufficient of it is put between the ties to hold the track to the line of the grade during the moving over of ballast trains and other construction trains.
>
> After the grade is brought up to the line, the next step in the operation is to put the track on and ties are strung along and the rails are spiked to the ties.

Then the surfacing of which I speak is the putting in between ties of some of the material of which the bank is made, in order to keep the ties in place temporarily until the ballast is applied. It would not be practicable not to do the surfacing at all, but wait until the ballast comes along and save this item of cutting out between ties, for which I charge two cents a yard for the ballast, for the reason that the surface of the grade is so rough that rails would be bent and the damage resulting in the way of injury to the rails would more than offset the expense that is gone to in skeleton surfacing and the cutting out of clay, sand or other material after the ballast is delivered.

It is frequently true that in territory where sand or other favorable material occurs, the ballasting which is done is by casting up of sand or other material from the sides. I would call that surfacing rather than ballasting."

It is the cost of doing this work that constitutes the value of this schedule. Upon the question as to the amount of that cost there is a considerable variance in the testimony, not only between the parties, but between the witnesses testifying on behalf of complainant. The latter are four in number and their several estimates of the cost per mile of track-laying and surfacing are as follows: Riggs, $526; Young, $792; Loweth, $803 and Hogeland $851.

On behalf of the defendants, the only testimony is that of Mr. Hansel, who places the cost at $600 per mile.

In view of the fact that both Mr. Young and Mr. Loweth had had actual experience in such construction work in the Northern Peninsula of Michigan, as well as a wide general experience, and as the cost of such work

is largely affected by local conditions, I regard their testimony on this question as entitled to greater weight than that of either Mr. Riggs or Mr. Hansel, neither of whom had had such local experience; and taking their testimony in connection with that of Mr. Hogeland, I find the weight of evidence to be in favor of a higher cost per mile than that fixed by either Mr. Riggs or Mr. Hansel, but upon the principle of resolving doubts in favor of the defendants, I have adopted Mr. Hansel's figures and fixed the cost at $600 per mile. This is the amount that was claimed by complainant's counsel in their brief and the claim was criticised by defendants on the ground that the amount was never greater than that fixed by one of the complainant's own witnesses, Mr. Riggs. In view of the other testimony on the subject and of the fact that Mr. Riggs states that his price of $526 was a minimum, and that the work would probably cost considerably more than that amount, the criticism does not seem to be well grounded.

I find the total reproduction cost of this schedule to be $277,704, allocated as follows:

Freight	$ 29,442
Common freight and passenger	248,262

I have not allowed the value of track laying and surfacing on any of the branch lines, the grade of which is not owned by the complainant, as the evidence does not show by whom the track laying and surfacing was done.

Defendants' Objection No. 5 (c) (7) relates to my adoption of the unit price of $600, and therein it is claimed that the cost of reproduction of that item is not shown to be in excess of $526 per mile on complainant's railroad.

On a reconsideration of the evidence touching the cost of tracklaying and surfacing, I am unable to reach any other conclusion than that heretofore reached i. e., that $600 per mile is the proper allowance for such cost. This is the price fixed by Mr. Hansel and by all the other witnesses except Mr. Riggs, who fixed a minimum price of $526 and stated that it would probably cost considerably more than that. It will be seen, therefore, that this objection is based wholly on Mr. Riggs' testimony, and that it insists that because he fixed a minimum price of $526, that is the price which should be adopted, notwithstanding the fact that he says it would probably cost considerably more, and the further fact that the testimony of all the other witnesses is to the effect that it would cost $600 or more.

I cannot see how it is possible within reason to give such effect to Mr. Riggs' testimony as to what he considers a minimum price, and therefore see no reason for changing the allowance already made.

The amount thus fixed is also the present value of the schedule unless it ought to be reduced on account of depreciation. The defendants' claim that it should be reduced on account of depreciation by the sum of $63,121—that sum being arrived at, not by inspecting the condition of the work, but by applying to the reproduction cost of the schedule the average percentage of condition of the five preceding schedules, viz, 6, 7, 8, 9 and 10. The precise nature of the depreciation thus claimed is indicated by the method employed of determining its extent, viz, by applying to reproduction cost the average extent of the depreciation found to exist in the several items of physical property which enter into the construction of the structures of which track-laying and surfac-

ing is the completion or last stage of the work—those items consisting of (1) Ties, (2) Rails, (3) Track Fastenings, (4) Frogs, Switches and Crossings, (5) Ballast.

It will thus be seen that the depreciation claimed is of an entirely different character from that with which we have hitherto had to deal, in that it is not a depreciation in the value of a certain physical property—a depreciation that is determined both as to its existence and extent by an inspection of the condition of the property, but a depreciation in the value of certain labor performed in assembling a number of items of physical property; and the depreciation is claimed to exist in the value of this labor, not because the labor would cost any less now than when it was done, or that the work is any less efficient now than before, but because the several items of physical property which were assembled by the work are found to be in a depreciated condition. It is seen, therefore, that the depreciation thus claimed is not an actual, but what might be called a theoretical or putative depreciation—a depreciation imputed to the labor employed in reproducing the property, because in that reproduction it is supposed to be employed on depreciated physical material, and is therefore itself presumed to be depreciated to the level of the depreciated material—on the principle, it would seem of *noscitur a sociis*—it having been found in bad company.

Does the method of determining present value on the basis of reproduction cost call for or justify this curious application of the principle of depreciation?

In arguing that it does, the defendants liken this labor to the labor which has entered into a bridge that has depreciated, and, say, that just as the value of the latter is carried down by the depreciation of the bridge, in like manner and in the same degree, the labor of track laying

and surfacing, is carried down by the depreciation of the materials on which it was employed.

Certainly the depreciation of a bridge carries down with it every value that enters into the total value of the physical structure to which the depreciation is applied, including labor, and with the termination of the life of the bridge, every such value disappears—disappears entirely as an element of value in that particular bridge, although it may still have a scrap value for other uses or purposes. And if there is nothing that differentiates the status in this regard of the labor that has entered into the bridge from that of the labor of track-laying and surfacing that has entered into (for example) a certain mile of the complainant's roadway, and if the reasons for the depreciation of the former are equally cogent for the alleged depreciation of the latter, then the defendants' argument would seem to be sound. Is there such similarity between the two classes?

The purpose of determining depreciation and deducting it from reproduction cost is to determine replacement cost—the cost that is to say, of replacing a thing in its present condition. In the case of the bridge, the replacement can be effected only by the actual expenditure of reproduction cost new, but it is nevertheless presumed to be replaced at the cost of reproduction new less depreciation because the company have, or are presumed to have in a depreciation fund set aside for that purpose out of operating expenses, a sufficient sum to cover the difference between reproduction cost new and present value, so-called, including the portion of labor value which had disappeared.

In comparison with this, the mile of roadway presents an entirely different case. The mile of roadway does not, like the bridge, constitute a structural entity which can be replaced only at a cost of reproduction new of the en-

tire structure and to which in its entirety there can be applied a depreciation which may be called a structural depreciation such as is applied to the bridge—such mile of roadway being rather an assemblage of distinct physical items which are brought together for collective use, each of which is depreciated individually, and each of which may be removed and replaced at any time without interference with any of the other items; and therefore the mile of roadway may by such removal and renewal be kept in such condition that it is at all times just as efficient for railroad use as when first constructed. And so long as it is in fact kept in such condition the mile of roadway is just as valuable as an instrumentality for transportation as if newly constructed, and therefore the labor which created that efficiency by uniting the physical items and placing them in position is just as valuable as when newly performed.

If the complainant's roadway is in such condition, then there is no depreciation which could carry down this labor item which entered into it in track-laying and surfacing. Is it in such condition? Upon this question there is abundant evidence to the effect that it is, and no evidence to the contrary. All of the witnesses who testify on the subject, including Mr. Hansel, agree that the road as an operating instrumentality is in 100 per cent of efficiency. And specifically as regards depreciation in this particular item, both Mr. Riggs and Mr. Hansel testify that it should not be depreciated, giving as their reason therefor that it is a labor item; and their testimony would have been perfectly convincing if they had gone further and explained how it is that this item, because it is a labor item, is not depreciated, although other labor items, such for example as that entering into the supposed bridge are depreciated. The explanation is this: labor value is depreciated in a rate case when found in any item of phys-

ical property against which depreciation is permitted to be charged, and also in all items which can presumptively be duplicated or replaced at a cost represented by reproduction cost new less depreciation, such, for example, as the ties, rails, etc., in the supposed mile of roadway.

Where the item under consideration consists entirely of labor supposedly performed in reproducing the property, as in this instance, there obviously can be no depreciation, for it is labor presumed to be performed in the present.

It must be borne in mind that what we are here seeking to do is to determine what it will cost to reproduce this roadway now in its present condition. We have found from Mr. Hansel's testimony that the labor of track-laying and surfacing will cost $600 per mile; and we are to assume that the depreciated material used can be procured at a cost of reproduction cost new less depreciation. Now, this claim of depreciation would require us to make the further assumption that because the material employed can be acquired at its depreciated value, the labor required which the evidence shows will cost $600 per mile, can be procured at a less cost in proportion to the depreciated cost of the material employed. In other words, if the material employed is in 50 per cent condition we are required to assume that this labor which is appraised at $600 per mile can be procured at a cost of $300 per mile; and if the material is in 25 per cent condition, we are required to assume that this labor can be procured at $150 per mile, and these assumptions are to be made in the face of the fact that the evidence shows affirmatively that the labor would cost $600 per mile and that therefore neither of the assumptions could by any possibility be justified.

Seeing that it involves such impossible assumptions, how could the idea of thus depreciating this labor cost have originated? It arises from a failure to bear in mind what kind of value it is that we are here seeking to deter-

mine. It is another illustration of the confusion that inevitably arises from the failure to distinguish properly between replacement cost value and commercial value, and to bear in mind that it is the former and not the latter that we are here seeking to determine. Estimated on the basis of commercial value, a thing into which labor has entered may not be worth the combined cost of the labor and material or even of the labor alone; but that economic fact has no relevancy here. The entire theory of valuing on the basis of reproduction cost in a rate case is based on the assumption that the property in question is a necessity, and is therefore worth its cost and that cost is therefore the Alpha and Omega of our inquiry. When that cost has been determined the value of the thing, for the purpose of a rate case, has thereby been determined and the inquiry is ended. Whether the thing could then be sold in the market for the amount of its replacement cost is an entirely different question, and one which cannot influence the question of cost in any way. It will, however, help to illuminate the subject to recall to mind that the commercial value of a railroad property instead of influencing cost as this claim assumes, is, in reality, dependent upon and is determined by cost, because it depends upon the rates permitted to be charged and the rates which must be permitted to be charged, under the constitution, depend upon and are determined by the replacement cost of the property.

Defendants' Objection No. 5 (c) (8) relates to my refusal to depreciate Track Laying and Surfacing.

On further consideration of this subject, I can see no reason to change the views expressed in connection with my findings, nor anything to add thereto, except to emphasize the fact that the depreciation here contended for by defendants is not an actual but a theoretical depreciation, and to point out that as such it involves an impos-

sible hypothesis—the hypothesis that the life of the effects wrought by this labor item is co-terminous with the average of the lives of the five classes of physical material which are put in place by this labor item, viz: (1) Ties, (2) Rails, (3) Track-Fastenings, (4) Frogs, Switches and Crossings, (5) Ballast. That this is an impossible hypothesis is perfectly clear. The life of the effects wrought by the labor item obviously bears no relation to that of either of the physical items that would make it coterminous with the life of either of those items; much less does it bear such relation to the average of the lives of the physical items. That the effects of the work of track laying and surfacing depreciate there can be no doubt — those effects are constantly depreciating: but that depreciation is, as I have found in this case, constantly being overcome by further labor as is shown by the testimony, so that there is here no depreciation in fact. And it must be borne in mind that such actual depreciation is something entirely different from the theoretical depreciation proposed by defendants, in that amongst other things, the former is wholly independent of the conditions of the physical items as regards depreciation, while the latter is wholly dependent upon those conditions.

As regards actual depreciation, the effects of the labor item may be greatly depreciated, although the physical items are but slightly depreciated or not at all, and vice versa; but as regards this theoretical depreciation these conditions are exactly reversed; there the effects of the labor are depreciated according to the conditions of the physical items, although there is in fact no depreciation in those effects; and on the other hand, if the physical items were in 100 per cent condition there would be no theoretical depreciation in the effects of the labor, although there might be actual depreciation to the point

of zero. The very next day after the completion of track laying and surfacing, a washout might entirely destroy the effects of the work, and leave the physical items unimpaired. For this reason this theoretical depreciation is one which cannot be rationally entertained.

Furthermore, this theoretical depreciation involves a further impossible hypothesis for the reason that the collective effects of this labor item have no determinable period of life, and therefore none that could possibly be co-terminous with the average life of the physical items or with the life of anything else. The effects of the labor are all the time dying more or less rapidly, according to varying conditions of wear and weather, without any regard to the conditions of the physical items and are therefore all the time requiring to be kept restored, as they are in fact kept restored in this instance. This lack of any determinable period of life is one of the features that clearly differentiate the effects of the labor in constructing a mile of roadway from those of constructing a bridge. In the case of the bridge the effects of the labor employed have a determinable period of life, that period being co-terminous with the life of the entire bridge as a structural entity. When the life of that structural entity terminates, the life of each member as a component part of that entity terminates also. I say "as a component part of that entity", for it is only as such that its life then terminates. It may have a life as something else that does not terminate with the life of the bridge but continues on after the bridge as a structural entity has ceased to exist. Thus, any one of the physical parts of the structure may, when the bridge ceases to exist, still be in good condition and have a second-hand or scrap value for further or other uses, although as a useful element in that particular structure its life is gone. But with the effects of the labor item the case is entirely dif-

ferent. Those effects have no other life than that which pertains to the structural entity of the bridge and therefore have none that can survive the termination of the structure. It is clear, therefore, that the case of the mile of roadway differs fundamentally from the bridge and that in the former there can be no such theoretical depreciation as is claimed.

It may also be added that when the purpose of this valuation is taken into consideration, even where there is actual depreciation, it may be questionable to what extent such depreciation should be considered. If the results of the labor are greatly depreciated, or entirely destroyed by accident or otherwise without fault of the owner as in the case above supposed, it would seem irrational to say that the company should have a return only on their road in that condition.

Schedule 12.—Fencing.

I find the present value of the items in this schedule to be $83,196 and the allocations to be as follows:

Freight	$ 6,296
Common freight and passenger	76,900

There is no dispute between the parties on this schedule.

Schedule 13.—Crossings, Cattle Guards and Signs.

I find the present value of the items in this schedule to be $12,603. The allocations are as follows:

Freight	$ 913
Common freight and passenger	11,690

There is no dispute between the parties on this schedule.

Schedule 14.—Interlocking and Signal Apparatus.

I have adopted the defendants' valuation on this schedule. The amount of the same is $800, and all of it is assigned to common freight and passenger.

Schedule 15.—Telegraph and Telephone.

I find the present value of the items in this schedule to be $37,072. The allocations are as follows:

Freight	$ 516
Common freight and passenger	36,556

There is no dispute between the parties on this schedule.

Schedule 16.—Side Tracks.

The parties differ on this schedule only as to unit prices. After a careful consideration of the testimony, I am not convinced that the complainant has proved the Riggs estimate to be the more accurate and I have therefore, adopted the lower figures of Mr. Hansel and have applied the same to the sidetrack mileage existing in 1913.

The allocations are as follows:

Passenger	$ 7,713
Freight	391,244
Common freight and passenger	153,818
	$552,775

Schedule 17.—Station Buildings and Fixtures.

The inventories and appraisals of complainant's engineer, Mr. Riggs, and of defendants' engineer, Mr. Hansel, were surpisingly close on this schedule, the difference between the two consisting mainly in the value of new buildings constructed after the Hansel inventory. The

defendants, however, offered testimony of two Grand Rapids builders which tended to show that the valuations of both engineers as to this schedule were far in excess of the true values. Thereupon complainant, in rebuttal, offered the testimony of one Rowson, whose qualifications and experience as a builder and estimator, and whose testimony as to his examination and estimate of the values of the buildings in question was so convincing in substantiation of the Riggs estimate, that I could not but find that the appraisal of Mr. Riggs as to this schedule should be accepted.

I therefore found the present value of the items in this schedule to be $143,489, with allocations as follows:

Passenger	$45,844
Freight	38,502
Common freight and passenger	59,143
	$143,489

To this finding in my tentative report the defendants' Objection No. 9 is directed. It consists of two subdivisions, (a) and (b), as follows:

"(a) Passenger stations, at points where there is no exclusive freight building, or where the common agent makes his office in the passenger station and it is essential that the public doing freight business with the road use the so-called passenger station, are assigned in too large a proportion to passenger business, with insufficient separation to freight business."

"(b) An insufficient part of the Marquette station and grounds is assigned to common and freight business, and no part of them is assigned to the Wisconsin business."

"(a)" applies to passenger stations at Wellsburg, Eckerman, Newberry, Seney, Wetmore, Champion, Nestoria and Thomaston. The primary and principal use of the stations at the places above mentioned is for passenger service, but each one of them has in it an office used in some instances by the telegraph operator, and in some instances used also by the station agent in doing some of his freight business. Complainant proved the quantity of floor space in each of these stations occupied by the office, and in proportion to such floor space assigned a part of the value of the building to the common service. I adopted this assignment as correct, and considered it a fair division because, while there was some use of the waiting rooms by the public in sending telegrams, and some use by persons doing freight business with the agent, the part of the office used by the telegraph operator was in most instances a very inconsiderable part. The defendants suggest no method of making a different assignment. I do not feel sure that any different assignment is, within fairness, required, but I have concluded, in order that there may be no question about the matter, to increase the amount assigned to common of the stations above named by 25%.

At St. Ignace, Marquette, Negaunee and Ishpeming there are passenger stations with offices which are used by telegraph operators as well as by the employes engaged in selling tickets, and perhaps also these offices are occasionally used by the agent in transacting freight business. These places are all considerable towns, and each has a freight station with an office where the great bulk of the freight business is done. Because of the difference in the size of the places as compared with the group above treated, it would be manifestly unjust to increase the portion assigned to common by so great a percent as 25%;

I think 10% is a liberal allowance. I have changed my apportionments accordingly.

Referring to the subdivision "(b)" of this objection, the second story of said station is used for a part of the general offices of the road, and the proportion of the value of the whole building represented by such use is, according to the only testimony on the subject (that of Mr. Cadarette) one-third thereof. Of this amount some part should be apportioned to Wisconsin. Such apportionment I have made on the basis of track miles, which gives to the Michigan value $7,523. It appears that of this common portion of the building, a certain office, amounting to 14½% of the total office space, is used by the car accountant, and it is defendants' contention that as his duties are concerned almost entirely in keeping track of freight cars, such portion of the value should be apportioned to freight. I find that this contention is well founded, and that the proportion of such value would be $1,091.

I have changed my valuation and apportionment of this schedule in accordance with the above views, with the result that I find the present value of the item "Property attributable to Michigan", to be $141,904.

The allocations are as follows:

Passenger	$43,864
Freight	38,502
Common freight and passenger	59,538
	$141,904

Schedule 19.—Shops, Engine Houses and Turntables.

It is the complainant's claim that this schedule should be valued on the basis of the Riggs' 1913 appraisal, while defendants contend that the Hansel 1912 appraisal should

be taken as the basis, and to reach the proper valuation, there should be added to the Hansel appraisal the additions to the property made in the fiscal year 1913, and there should be deducted any property valued by Hansel and abandoned in 1913. I have concluded to adopt defendants' method for the reason that I find no corroborative testimony which justifies me in taking the Riggs' higher values in 1911, rather than Hansel's valuation in 1912.

I find, however, on computing the additions and deductions, that the figures claimed by defendants in their brief are incorrect, both as to additions and deductions. I find that the total additions to the property in this schedule in 1913 were $60,824, and the property in the Hansel appraisal which was abandoned during the year 1913 amounted to $40,028. My deductions include the amount necessary to correct Hansel's mistake of including the property of the Sainte Marie Union Depot Company at its full value, when the complainant has only a one-half interest therein. Applying these additions and deductions to the Hansel total of $166,185, I find the present value of the items in this schedule to be $186,981, allocated as follows:

Freight	$ 10,961
Common	176,020

Of these values, I have later assigned a portion to Wisconsin, in the manner and for the reasons hereinafter explained under the heading "Deductions from inventory by reason of property located in Michigan, but which is also used for Wisconsin operations".

Schedule 20.—Shop Machinery and Tools.

The parties are agreed upon the value of this schedule and its allocations as fixed by Riggs in 1913.

Freight	$ 281
Common freight and passenger	98,987
Total	$99,268

The defendants, however, claim that the entire schedule should be divided between Michigan and Wisconsin. I cannot adopt this view, but I have apportioned to Wisconsin a portion of the shop machinery and tools in the Marquette shop, for the reasons hereinafter explained under the heading "Deductions from inventory by reason of property located in Michigan, but which is also used for Wisconsin operations."

Schedule 21.—Roadway and Construction Tools.

I find the present value of the items contained in this schedule to be $12,832, all allocated to common. There is no dispute between the parties on this schedule.

Schedule 22.—Water Stations.

The Hansel valuation of this schedule is considerably higher than that of Riggs on the estimated cost of reproduction but his present value figures are about $4,000 less than those of Riggs, due to his having a greater percentage of depreciation.

The testimony shows that each structure in this schedule was inspected by Riggs or his assistant, Anderson, in some instances by both, and the percentage of condition was determined for each station separately. On the other hand, Hansel figures a general percentage of condition of 70% on everything in the schedule, regardless of its age, or amount of service. It is clear that the method adopted by Mr. Riggs was a much more accurate one, and I have therefore accepted his present value figures.

I find the amount of the same to be $72,422, all assigned to common.

Schedule 23.—Fuel Stations.

On this schedule I have taken the Hansel figures, which were lower than those of Riggs in 1913, and have added to the same the value of the additions made to the property in 1913, after the Hansel appraisal, and have deducted the property inventoried by Hansel, which was abandoned in 1913. The additions amount to $11,696, and the deductions to $3,184, making a net addition of $8,512 to me made to Hansel's valuation of $60,582.

The allocations of this schedule are as follows:

Freight	$ 845
Common	68,249

Schedule 26.—Docks and Wharves.

I find the present value of the items contained in this schedule to be $475,118. The allocations and assignments are as follows:

Passenger (foot-walk to ferry at St. Ignace)	$ 715
Freight (ore docks)	392,980
Freight	56,842
Common freight and passenger (car ferry dock at St. Ignace)	24,581

In valuing the above items, I have taken the figures of Mr. Hansel as to Ore Docks Nos. 4 and 5.

It appears from the testimony, however, that although Ore Dock No. 4 was in use during the shipping season of 1912, its use was abandoned in the spring of 1913, when the new ore cars, purchased in part for storage purposes, came on the road and were put into use. Inasmuch as this dock was not in use during the whole of the fiscal

year 1913, the whole of its value cannot be included in figuring the return from the operations of that year, and I therefore, in making my valuation, include only two-thirds of the value of said dock as found by me, amounting to $67,633.00, such value representing the proper proportion, according to the time in which such dock was in use during that year.

The item of $56,842 is made up of the freight dock property at Baraga, Houghton and St. Ignace, the values of which are not in dispute, together with $20,951 which I fix as the value of docks at Marquette, as follows:

Pier, trestle approach and a crib south of Baraga Avenue	$4,061
This property is used for bank protection.	
Merchandise pier	9,558
Wharf, 18x420 feet, Hocking Bulkhead Coal Dock	882
Revetment	376
Coal dock-spear	4,422
Small dock	373
Freight warehouse	1,174
Coal dock office	105

All of the property last above valued is on or attached to the water front land in the city of Marquette, heretofore discussed by me under Schedule 1. All of it except the pier, trestle approach and crib first mentioned, and the coal dock office, are rented under the leases in that discussion referred to.

This land and dock property constitute the complainant's only connection with navigation on Lake Superior at Marquette. By far the greatest part of the coal used by the railroad is obtained by water over these docks, as well as practically all the coal for all the mines served by complainant's railroad and by the Lake Superior &

Ishpeming Railway, as well as all the coal domestically or otherwise used in the County of Marquette. On both these coal docks complainant has railroad tracks.

On the merchandise dock it has a track, and this dock affords complainant's only connection with the package freight boats which stop at Marquette.

If the lessees, or someone else, did not carry on the coal unloading business and maintain the merchandise dock, the railroad company itself would be compelled to do this business.

The approach to the ore dock by boat can only be preserved by complainant's owning very considerable land on each side of the dock.

Under these circumstances, and taking into consideration all the facts, I am clearly of the opinion that the land referred to, and these docks, are necessary for, and are in, railroad use, but that the situation is such that a concurrent use of portions of the property by industries whose occupation of the territory can be controlled by the railroad company is feasible and that the income from this rented property, being included in the railway earnings, as I have included it, lessens to the extent of the rents, the cost to the public of the use of this land, and these docks for railroad purposes.

As this rented dock property is only valued at $20,951, and that amount is all allocated to freight, the question whether it should be included in complainant's inventory is not very material.

Schedule 27.—Electric Plants.

I find the present value of the items contained in this schedule to be $8,855, all allocated to common. There is no dispute between the parties on this schedule.

Schedule 28.—Miscellaneous Structures.

On this schedule the Hansel figures are in excess of those of Riggs, and the defendants are agreed that the Riggs' figures should be taken. The allocations are as follows:

Freight	$16,357
Common freight and passenger	103,367
Total	$119,724

Schedule 29.—Engineering on Roadway and Structures.

Mr. Riggs estimated this item by applying a percentage of 4% to schedules 3 to 28 inclusive.

Mr. Hansel estimated the engineering force which would be required to survey and construct complainant's railroad in Michigan and computed the probable expenses of such force. He arrived at a cost of $275,000, to which sum $20,000 was estimated as cost of acquiring right of way.

While the percentage method is a generally accepted method for computing this cost, the method adopted by Mr. Hansel seems to me more scientific. I have, therefore, adopted it, rejecting the item of $20,000 for acquiring right of way. I have included the cost of surveying the road estimated by Mr. Hansel at $50,000 for it is a cost of construction, in no way connected with the cost or value of the right of way, as clearly appears from his own testimony.

I have fixed the value of this schedule at $255,000 and have assigned the same to passenger, freight and common, on the basis of the allocations of Schedules 3 to 28 inclusive.

Schedule 30.—Locomotives.

The valuations under this schedule are not far apart, and the Hansel valuation is the higher—the Riggs valuation in 1911, being $443,304, and the Hansel in 1912 being $466,852. But the second Riggs' valuation made in 1913 increases his former to $702,342, an increase of $259,038. This increase arose from the addition to complainant's equipment of 15 new locomotives, which were purchased in the early part of 1913, and came into service on the road in July or August of that year, and the only question in dispute is whether these new locomotives should be included in the inventory. The complainant's claim that as they were a part of the company's property at the date of the inventory and shortly thereafter were, and ever since have been, and in the future will continue to be, in actual use on complainants' railroad, they are a part of the property on which the complainants are now, and in the future will be, entitled to a return; and for this reason they insist that these new locomotives should be included in the inventory. The defendants claim that as these locomotives were not in use during any portion of the period which forms the basis of the return on which future earnings are to be estimated, they are no part of the property employed in earning that return, and therefore should not be included in the inventory.

In this dispute, each party is right in his premises, and therefore one or the other must necessarily be wrong in his conclusion.

It is perfectly true, as claimed by the complainants that these locomotives are a part of the property on which the prescribed rate will be required to pay a return; and it is equally true, as claimed by defendants that these locomotives were not a part of the property on which the complainants were entitled to a return in the year 1913 that is to be used as a basis for forecasting the future.

Which of the two opposing conclusions thus drawn from these correct premises is correct? The answer to this question depends on the purpose of the inventory. Now, the purpose of the inventory is to furnish the data of value necessary to determine what rate of return is to be expected from complainant's future operations.

This being so, it would seem at first blush that as the property in question is to be employed in the period that is to be forecast, it should, as complainants contend, be included in the inventory. But this contention fails to take into account the precise manner in which the future rate of return is to be estimated. It overlooks the fact that the future rate of return is to be estimated by first ascertaining the past rate of return and then basing the estimate of the future on the presumption that the future rate of return will be the same as it has been in the past. In making this estimate, it is the past *rate* of return (not the return itself) i. e., the relation of the particular past return to the value of the particular property employed in earning that particular return in the past period, that it is presumed will be the same in the future period to be forecast. In that future period, the value of the property employed may be different, and the return may be different from what either was in the past period, but the relation of the latter to the former, i. e., the rate of return, is presumed to be the same. From this it clearly appears that the value to be shown by the inventory is not the value of the property to be employed in the future period, but that which was employed in the past period—the value on which the rate of return to be found from past experience is to be computed.

As none of the locomotives in question were a part of the property employed in the past period, it follows that the defendants are right in their contention, and that the locomotives must be excluded from the valuation on

which the estimate of future rate of return is to be based.

This may seem on its face inequitable and it may be so in fact, as the locomotives are certain to be employed in earning the return to be realized in the future period, but if so, the inequity is unavoidable. It could not be avoided except by finding or assuming that this additional value in locomotives is required in order to earn in the future period the same return that was earned in the past period by a smaller locomotive value, and there is no evidence on which to base such a finding and no basis for making such an assumption. If any assumption were to be here indulged, it would be that, as the new locomotives were to constitute an addition to and not a substitution in the supply of locomotives already on hand, and as the return in the past period was earned by the latter supply, the presumption would be that the new locomotives were acquired in anticipation of an increase in business and that such increase of business would produce a corresponding increase in return so that the rate of return on the increased property value employed in the future period would be the same as the rate on the lesser value in the past period. I find the present value of the items in this schedule to be $428,309; and that the same is allocated as follows:

Passenger	$147,377
Freight	280,932

Schedule 31.—Passenger Train Cars.

Mr. Riggs' valuation of this schedule is less than Mr. Hansel's, and both parties accept the Riggs figure.

The only difference between the parties on this schedule is as to the method of apportionment of certain values to Wisconsin.

The method of apportionment used by both Riggs and

Hansel was to separate from the rest of the passenger train cars those cars which are used in trains running into Wisconsin, including sleeping cars, and a portion of the value of each of such cars was apportioned to Wisconsin on the relation of the passenger car miles made by each of such cars in Wisconsin to the total passenger car miles made by such car. The remaining value, as well as the value of all cars which do not run into Wisconsin at all, was assigned to Michigan.

Defendants' counsel argue for and use a different method of apportionment between states, but it seems clear that the method used by Riggs and Hansel is much more accurate, amounting nearly to an allocation, and I have adopted it.

I find the present value of the items contained in this schedule to be $255,287. Of this amount, $6,464 being the present value of the two official cars, is assigned to common freight and passenger, and the balance is allocated to passenger.

The allocations are:

Passenger	$248,823
Common	6,464
Total	$255,287

Schedule 32.—Freight Train Cars.

The only dispute between the parties on this schedule is as to the inclusion of certain ore cars which were purchased after the Hansel appraisal, and which were valued by Mr. Riggs at their actual cost, $377,200. The testimony shows that these cars were purchased and came on complainant's road at the opening of the ore season in 1913, several months before the Riggs' 1913 appraisal, and have been used ever since in complainant's freight business.

Inasmuch as these cars were not in use during the whole of the fiscal year 1913, their whole value cannot be included by me in figuring the return for that year upon the property invested. I have, therefore, included such cars at only one-third of their cost as shown by the testimony, viz., at $125,733, that representing the proportion of the time during which said cars were in use in that year.

I find the present value of all the items in this schedule to be $1,116,545, all allocated to freight.

Schedule 33.—Miscellaneous Equipment.

I find the present value of the items contained in this schedule to be $59,972, all allocated to common. There is no dispute between the parties as to this schedule.

Schedule 34.—Ferries and Steamships.

The only property contained in this schedule is an undivided one-third of the property of a company known as the Mackinac Transportation Company, in which the complainants own one-third of the capital stock. The question here is whether for the purposes of this case, this one-third interest or any part of it should be included in complainant's inventory.

The answer to this question will depend, of course, upon whether the property in question, or any part of it, is employed in the passenger service of the complainant company to which the rate applies. Any property that is so employed must be included, and all property not so employed must be excluded.

The facts with regard to the Mackinac Transportation Company and its property are as follows:

This company is a corporation operating ferry boats across the Straits of Mackinac, between St. Ignace in the Upper Peninsula, and Mackinaw City in the Lower Pen-

insula. These ferry boats afford the only means of connection between the complainant's railroad, which is all in the Upper Peninsula, and the only railroads in the Lower Peninsula which reach the Straits, viz., the Michigan Central and the Grand Rapids & Indiana Railroads. The transportation company is controlled in equal shares by these three railroads by stock ownership.

In carrying on its business the transportation company deals in part with the public but principally with the three railroads. It deals with the public only in the transportation of passengers and a small amount of local freight between St. Ignace and Mackinac. As it is not under the railroad laws of the state, its passenger rates are not limited by the statutes which regulate railway fares. For the trip across the straits, it charges 50¢ or above 7¢ per mile. Aside from this passenger and local freight business, the transportation company has no dealings with the public, but deals with the three railroads exclusively. Its dealings with them consist in the transportation of their cars, both freight and passenger, with their contents, across the straits, and in compensation for that service, the railroad companies jointly furnish the property required for the performance of the service and pay all the expenses involved in operating and maintaining the property—the separate amount contributed by each company to this joint payment of expenses being in proportion to the freight carried for each.

From these facts, it clearly appears that all of the property of the Mackinac Transportation Company is employed in the freight service of the three railroads, and that no part of it is employed in the passenger service of the complainant company to which the prescribed rate applies; and therefore, that no part of that property should be included in any valuation of property

made for the purpose of determining the question whether the prescribed rate will yield a fair return upon the value of the property employed in the service to which the rate applies.

But the defendants claim, nevertheless, that the passenger earnings of the transportation company are to all intents and purposes passenger earnings of the three railroads, and should be so treated for the purpose of this case, i. e., that the net earnings or profits should be added to the total of the net railway passenger earnings as part of the passenger revenue realizable under the rate in question. This claim more properly arises and is made in connection with the subject of complainant's income but I deem it better to dispose of the entire subject of the transportation company at once. The claim is one for which I am unable to see any good ground. We are seeking to determine whether the rate in question will yield fair compensation for the use of the property employed in the service to which the rate applies, such compensation being a fair return on the value of the property so employed; and this claim would, in such inquiry, credit the rate, not only with the earnings of the property so employed, but also with those of other property not so employed.

The defendant's answer to this apparent inconsistency is a claim that the passenger revenue of the Mackinac Transportation Company is not earned entirely by the use of the property of that company but is earned at least in part by the use of some of the passenger equipment of the complainant. The basis for this claim consists in the fact that some of the complainant's passenger coaches are carried across the straits on the same boat that carries the passengers, and the passengers may, and usually do, occupy seats in the coaches during the voyage, although a cabin for their accomodation is pro-

vided on the boat. The question, therefore, arises what effect is to be given in this case to the fact that the complainant's passenger coaches are so carried and used. While the coaches are being so carried, are they being used in the passenger service of the transportation company or in that of the complainant company or in the service of both? And in either event, how is the case affected thereby? The utmost that can be claimed by the defendants is that while being so transported the coaches are wholly in the service of the transportation company, and are being used for their own benefit entirely—but even if this were the fact, I cannot see how that fact could possibly entitle the complainant company to the net passenger earnings of the transportation company or furnish any ground for treating them in this case as passenger earnings of the complainant company. If the transportation company, or any other outside party received the beneficial use of any of the passenger property inventoried in this case, the fair value of such beneficial use should be credited to passenger income in this case; but that such use by a third party would merely for that reason, entitle the complainant to the entire net earnings of the service in which the property was used, is impossible. In such case, the fair value of the use is all that complainants would be entitled to and that value would not be determined by such net earnings but by other considerations.

The question, therefore, is what, if any, amount should be credited to the passenger income of the complainants by reason of this use of their passenger coaches?

As between the passenger service of the transportation company and that of the complainants does the former derive from this use of the coaches of the complainant a benefit for which it is equitably bound to compensate the latter?

Why, and for whose benefit are these coaches thus carried across the straits? The purpose of this use of the coaches is plain; it is to increase the convenience and comfort of passengers and thereby to increase the volume of the passenger traffic. That it does increase the passenger traffic and thereby to some extent benefits the passenger traffic of both the transportation company and the complainant, there is no doubt.

Does the fact that this increase of traffic is secured by this use of the complainant's passenger coaches entitle the complainant to a portion of the passenger earnings of the transportation company? In order to do so, it must be found that the benefit derived by the Transportation company from this use is greater in proportion to that company's contribution to the expense of this extra service than is that of the complainant to its contribution to that expense. Such a finding it is impossible to make. It is impossible to determine either the extent to which either company is benefited by this increase, or the amount which either company contributes to the expense of this additional facility. But a general comparison of the relative proportions of each can be made and from such comparison it is plain to be seen that there is no ground for holding that the transportation company receives a greater benefit in proportion to its contribution than does the complainant company. There is no reason for thinking that the benefit received by the transportation company is any greater absolutely than is that of the complainant company, or that its contribution is any smaller; but, on the contrary, there is reason for holding that its contribution is greater. The contribution of the complainant is the use of the dead passenger coaches during the time occupied in making the round trip across the straits. This use of the coaches on the one hand involves no loss to the complainant as

the coaches would otherwise merely stand idle at St. Ignace during that time, and they suffer no damage from wear in this use as they are merely standing idle on the boat; and on the other hand, there is no direct advantage to the transportation company as they could carry the passengers just as well and more cheaply without the cars than with them. But the contribution made by the transportation company does involve additional cost. It consists in furnishing the boat-room, the steam power, and the labor required for the transportation of the coaches, which is very obviously greater in cost or value than the use of the coaches contributed by complainant.

My conclusion, therefore, is that there is no ground in this case for holding that the whole or any part of the passenger earnings of the transportation company should be treated as earnings of the complainant company; that none of the property of the complainant company is employed in earning the passenger revenue of the transportation company, and that none of the property of the transportation company is employed in the service to which the rate here in question applies, and therefore that none of that property should be included in any inventory made for the purpose of testing the validity of the rate in question; that under the agreement between the transportation company and the railroads, the passenger earnings of the transportation company are all devoted to defraying the expenses of the transportation company, which the railroads are obligated to pay in compensation for the carriage of their freight across the straits; that under the terms of that agreement, the practical effect of it is that all the property of the transportation company is employed in the freight service of the three railroads, and that one-third of it should therefore be included in the inventory of complainant's property, but should be allocated entirely

to freight. The complainant claims a valuation of $216,500 on this schedule, while defendants' claim is $210,000, the difference between the parties being that the defendants claim a somewhat greater depreciation on the boat Wawatam than was estimated by Mr. Riggs. I have adopted the defendants' figures of $210,000.

To my conclusions with reference to this Mackinac Transportation Company and its property defendants' Objection No. 17 (a) is directed. They claim that the passenger earnings of this company should be included in the passenger revenues of the complainant.

This subject in general, and the passenger earnings of this transportation company in particular, I have so fully discussed that I do not care to add anything to what I have already said, except it be to reply to the claim that my treatment of this subject is inconsistent with my treatment of the Soo bridge and the Soo station. With reference to this the defendants are mistaken. They say, "We are unable to reconcile the determination of the Master to retain the Soo bridge and Soo station as part of complainant's operations, and to eliminate the passenger operations and net passenger earnings over the Mackinac Transportation Company".

The mistake which they here make is in saying, by implication, that I have eliminated the passenger operations and earnings of the Mackinac Transportation Company from *complainant's operations*, which is not the case. On the contrary, these operations are treated precisely as are those of the Soo bridge and Soo depot, and are included in complainant's operations precisely as are the latter, except that the operations of the former are entirely freight operations. The passenger earnings of the Mackinac Transportation Company are treated as

what may be called "Side earnings" of that company incidental to its freight operations, and are applied toward the payment of freight expenses just as the cash earnings of local package freight are so applied.

Schedule 35.—Engineering on Equipment.

Both Mr. Riggs and Mr. Hansel agree that to arrive at the true value of complainant's property, an allowance for engineering on equipment must be made and they agree that this element of value can best be computed as a percentage of the schedules affected, which are 30 to 35 inclusive, and that 2% is a reasonable percentage on that account. This percentage therefore, I have used in such a manner that it does not apply upon the value of equipment purchased in 1910, 1911, 1912 and 1913, because in fixing the value of the equipment purchased in those years, both engineers used the cost as shown by the books of the company, and presumptively at least, this cost included the item of engineering.

To this finding defendants' Objection No. 5 (c) (13) relates, and the claim is that

> "the larger part of the present equipment was added during operation. There is no shown cost or expense for engineering thereon. If there was any such cost, it has been charged in operating expenses, and, under *Louisiana Railroad Commission vs. Cumberland Telephone Co.* (212 U. S., 423-25), it cannot be included in the value to be supported by rates."

The objection assumes that what we are here seeking to determine is the amount that it has actually cost the complainant as an operating road to acquire its present equipment, and that no cost of engineering on equipment should be allowed, because the engineering on the present equipment was presumably done by complainant's

own staff of engineers, and that the cost of it was therefore charged and included in operating expenses.

Such assumption is erroneous. The inquiry here is not what it has actually cost the company for engineering on their present equipment, but what it would cost anybody to reproduce this equipment, and on that question all the engineers agree that on such reproduction an engineering charge on equipment of two per cent, of the cost of the equipment would be a reasonable allowance for that item.

Unless this case is being tried on a theory that is fundamentally wrong, I am unable to see how the question whether the cost of engineering on the company's present equipment was charged to operating expenses is of any consequence in this case.

In this view I am of the opinion that I was in error in not applying the percentage, as did the witnesses named, to the equipment purchased in 1910 to 1913, inclusive, and I now apply it to schedules 30 to 33, inclusive, in their entirety.

The allocations will follow those of the schedules on which this item is computed.

Schedule 36.—Terminals.

The only items contained in this schedule are two properties at Sault Ste. Marie, Michigan, viz: the property owned by the Sainte Marie Union Depot Company and the property of the New Jersey Bridge Construction Company.

There is no dispute between the parties that one-half of the property owned by this depot company devoted to railroad use, is used by the complainant, and should be included in this valuation. The situation is fully explained heretofore in my findings under the heading

"Lands in Chippewa County". The valuation under this schedule is the property other than land.

Mr. Riggs' method of arriving at the value of complainant's interest in this property was to value different items comprising the same, as shown by his inventory, to add thereto an engineering charge of 4% and then to assign one-half of the total value to the complainant.

Mr. Hansel's method was to value the separate items and then add 20% to cover what he calls overheads.

If, to the amount of the Hansel appraisal, less his land values, and his overheads, there is added the value of the increased trackage in this terminal in 1913 as compared with 1912, the Hansel valuation would be slightly greater than that of Riggs.

I have taken the Hansel valuation, reduced as above. To this I have added a 4% engineering charge, for the reason that there is no evidence other than that of Mr. Riggs showing the proper charge for engineering and the amount which this percentage gives seems to me very reasonable.

Defendants, through some oversight, assign the whole of this terminal to passenger service, but Mr. Riggs' appraisal, together with his later testimony, changing the allocation of two of the tracks shows that the allocations should be as follows:

Passenger	$22,006
Freight	6,906
Common freight and passenger	11,091
Total	$40,003

The New Jersey Bridge Construction Company is a corporation owning and operating the International Bridge between the United States and Canada at Sault

Ste. Marie. The stock is owned by the complainant jointly with the Canadian Pacific Railway Company and the Minneapolis, St. Paul and Sault Ste Marie Railway Company, the complainant's interest being one-fourth. The bridge company has some small revenue obtained from the transportation of passengers over the bridge and from charges made for allowing the stringing of telephone wires, etc., on the bridge. The complainant's proportion of these revenues is included in its revenue account. The expenses of operating the bridge are divided among the owning companies in proportion to the business received over the bridge by each company respectively. The complainant's proportion of these expenses is included in its expense accounts. The complainant does not operate any freight or passenger trains over the bridge, but the same is used as a facility for getting freight and passenger business from the Dominion of Canada. I have therefore included the interest of the complainant in this property in my valuation, and have allocated the same to common freight and passenger, but have assigned it entirely to the interstate business.

I have taken the Hansel valuation of complainant's interest, except that in place of his overhead charges of 20%, I have allowed only an engineering charge of 4%, and I find the present value of the interest of the complainant in the property to be $60,271.

Counsel for defendants arrive at a different valuation, obviously because they use, in making their computations, a printed comparison of the different appraisals, prepared for the use of court and counsel, in which there was a mistake. My figures are based on defendant's Exhibit 15, Mr. Hansel's appraisal. This bridge company owns no land.

Schedule 37.—Contingencies.

The subject of Contingencies in a rate case presents difficult questions. A contingency is defined as "a contingent event", and a contingent event is an event that is liable to occur but is not predeterminable by any rule or law—an event resulting from an agency or agencies the operation of which is uncertain.

As used in a railroad rate case, the word "contingency" means the uncertain and unforseeable events that are liabel to occur in connection with the construction of a railroad property and which, if they do occur, will involve expenditures or costs in addition to the forseeable, certain costs which can be definitely estimated. It includes, also, when used in a rate case, all liability of error either in measurements, estimates or otherwise.

In dealing with the subject of contingencies, as it arises in making estimates of probable costs, it is universally recognized as a fact, demonstrated by experience that such unforseeable events are always liable to happen and that the amount of costs, as shown by estimates of the forseeable costs only, is therefore always liable to be increased by such unforseeable happenings. In consequence of this, it has become the general practice of engineers in making estimates of the cost of work to be undertaken, to first make their estimates of the forseeable costs, and then make an allowance for the unforseeable costs, and add it to the former. That these contingent costs should, in ordinary prudence, always be taken into consideration and that an estimate of the cost of a proposed work which includes a proper allowance for such costs will be more nearly correct than it would be without such allowance, there is no room for question, either in a rate case or elsewhere. The sole question in any given case is what shall be the amount of that allowance; and that question is one of extraordinary difficulty.

As the amount which it is required to fix is dependent upon future events that are not predeterminable by any rule or law, it is itself incapable of definite predetermination or of being estimated by any rule or law except by approximation based on the law of average. The only way in which it can be estimated is by taking the results of experience and applying to them the law of average—that is to say, by taking the average proportion which the contingent costs actually incurred in past operations bear to the entire cost of such operations and basing the estimate of future contingent costs on the assumption that that average will be maintained. This I have done in what follows:

Passing now to the question as to what, if any, amount should be allowed for contingencies in this case—that question must, of course, be determined from the evidence, i. e., it is to be determined on the basis of experience as that experience is shown by the evidence.

That evidence consists of the testimony of six witnesses, who testified as experts in engineering—five of whom testified on behalf of complainant, and one on behalf of defendants. All of those witnesses agreed in recognizing the liability to additional costs arising from contingencies, and also the need of making an allowance for such costs—the only difference between them being as to the amount of the allowance and the manner in which it should be arrived at.

The evidence on the subject is of two kinds, specific and general—specific as to the amount that has been found proper to be allowed in other cases, and generally—both the specific and the general testimony being based upon experience and both being expressed in a percentage on all or a great part of the other costs. The specific testimony on behalf of complainants is as follows:

Mr. Riggs, the complainant's chief expert allows for

contingencies a total of $918,429 which would equal an average percentage of 8.8% on schedules 3 to 28 inclusive. It was not, however, arrived at by such application of that percentage but by applying different percentages to different schedules.

Mr. Young, chief engineer of the Lake Superior and Ishpeming Railway considers Mr. Riggs' allowance too low (Record 925-27), and thinks that the allowance for contingencies in the reproduction cost of this property should not go below 10% of all the construction costs. (Record pp. 924 and 1899.)

Mr. Loweth, chief engineer of the Chicago, Milwaukee and St. Paul Ry. also thinks that the Riggs' estimate is too low; also that contingencies cannot be placed on specific items; and that in making an estimate of the fair reproduction cost of the South Shore road, it would be conservative to put a contingent item of 10% on the entire cost, except overheads. (Record pp. 2780-81.)

Both Mr. Young and Mr. Loweth testified from particular experience in the construction of railroads in the northern peninsula of Michigan, as well as from their general experience as engineers.

Professor M. E. Cooley of the Michigan University also fixes 10% as the percentage that he would apply for contingencies to a property like the South Shore.

This constitutes the complainant's specific testimony as to the proper amount to be allowed for contingencies in this particular case.

The general testimony on behalf of complainant is that of the witnesses Riggs, Young, Loweth, and Cooley, above named, all of whom testified in effect that from their experience as engineers, they had found that the contingency costs in railroad construction of this character would run from 10% up of the amount of the other costs, meaning construction costs; and also the testimony of Mr. Hoag-

land, the chief engineer of the Great Northern Railway, who testified that according to his experience the contingency costs would run from 10 to 15% and that in appraising the reproduction cost of a railroad, the contingency item has usually been taken at about 10%. This witness testified as follows:

> "I have made a special study to determine how estimated cost before the performance of the work compares with actual costs. In this work I went through the books of the Great Northern showing additions and improvements to the property from 1903 to 1907. All our estimates for additions and improvements are made up on what we call an authority for expenditure blanks so as to secure the approval of the executive officers before the money becomes available. I found that during these five years, the total estimated costs of additions and improvements was $25,223,738.65 and the actual cost of the work was $29,096,067.47—the increase over the estimate being 15.35 per cent. Those estimates were made with the intention of showing as nearly as we could, what the work would cost, and each one was itemized in detail and covered all classes of work and in locations with which the company and its engineering officers were as familiar as they could become by construction of the existing road." (Record 3125-6.)

As explaining and illustrating the nature and need of a contingency allowance, the following is taken from the testimony of Mr. Loweth, who had had a large experience in construction work as chief engineer of the C. M. & St. P. Railway Company:

> "The item of contingencies in the cost of reproduction of a given property should include those items

of cost, whatever their character, that could not be seen in making an inventory of the property, or which might be overlooked or by error or oversight, omitted from such inventory and by the possible error in the unit cost that might be taken in making the valuation. The contingencies in making an estimate of the cost of a property to be built would cover those things which, due to the haste in which the matter was investigated, had been overlooked or which from the nature of the case could not be foreseen and provided for. I think that there is very little, if any, difference in the allowance for contingencies in the case of making an estimate of reproduction of an existing property and in making an estimate of the cost of property that was proposed to be built, for the reason that as we go over a completed property there are always some elements of cost that are not apparent. It is impossible to carry out any large piece of construction without accidents, accidents of such a nature that they involve a loss of life and property. Those losses enter in as one of the contingent items. In going over a completed property it is impossible to tell whether anything of that kind did happen or not, but from our experience in reconstruction we know that they certainly do happen."

Mr. Loweth then mentioned certain things that happened in his own experience in the construction of the line built by his company to the Pacific Coast; as, for instance, the cost of making trails and roads in order to make surveys and to get the contractors' men and materials in; extra expense for freight, due to having to route construction materials over other roads, caused by delays in grading so that it was impossible for him to take such materials over his own road; building temporary bridges to enable the grading contractors to cross streams with

the track; building a tunnel at great expense, and then finding that the material was so yielding that it had to be made into an open cut; at least one severe flood which took out all the temporary bridges and a part of the bridges in course of construction for a distance of seventy-five miles; and a large number of fatal accidents to men.

After giving this experience, Mr. Loweth further testified as follows:

> "In my judgment it would be conservative to put the contingent item of ten per cent on the entire cost (of the physical items), in making an estimate of the fair reproduction cost of the D. S. S. & A. road in the Northern Peninsula of Michigan. While the contingent amount of some items might not be as large as ten per cent, on others it might very readily be much in excess. That would not include ten per cent on the cost of organization and legal expenses and interest and engineering and the like, but upon the physical items. In my opinion the ten per cent would be an average of all items and not the amount of contingencies applicable to each item. I think it is universal in making an estimate for new work to allow for contingencies, and it has been our practice to add ten per cent and to add ten per cent after we had taken unit prices that in a measure made some allowance for the same."
>
> "I am as confident, as I could be of anything, that has not occurred, that in the reconstruction of the South Shore road, we would have casualties, accidents, which would involve injury to persons and property, which would be contingent items such as those I have mentioned, for work of that character which would extend through three or more seasons. It is also quite sure that there would be contingent

items in the way of floods. There would be contingent items in respect to classification. I doubt not that there is considerable material, the exact character of which would not be evident on a superficial inspection of the property. I do not see how that extent of railroad could be built without involving diversions in the highways, in farm crossings, and in diversions of streams. Those contingent items would surely occur. There would be contingent items in connection with the construction of the road over or under or across other railroads, electric and steam; due to the crossing of telephone and telegraph wires, which would have to be changed; due to the construction in the cities in which paving would be disturbed, water works pipe, or sewers or things of that kind. There would be other contingent items that would be more or less of the general character of those I mentioned. In my judgment there is a reasonable probability that these or a certain proportion of them will occur in every railroad that is constructed. The percentage would vary according to the weather conditions, season of the year and character of the country through which the road was built. The contingent items would be smaller if all conditions were favorable, such as casualties, floods and things of that character. The item of farm crossings, highway crossings, of pavements in cities assume the passing through of a settled territory. If the territory is sparsely settled, the possibility of those items and the amount and percentage of them would be smaller, and for exactly the same reason, other contingent items would be more. There is, as I remember the country, a large proportion of swamp land and soft land, the surface of which is soft and yielding, and there would be a more than

usual contingent item in the increase of earthwork on that account. The country traversed by the South Shore Railroad is not as accessible for the getting of supplies and men as a similar length of railroad would be in many other sections of the country, and the difficulties of getting labor and holding labor and getting supplies in, would be enhanced over and above what it would be in most any other section of the country, anywhere within a radius of 500 miles, or a thousand miles."

This general testimony on the subject of contingencies introduced by complainants is uncontradicted; and not only so but it is confirmed so far as it relates to new work by the defendants' witness Mr. Hansel, who testified as follows:

"Q. Your contingency in round figures is $479,000; your total is 15 and a half millions—less than four pe rcent considerably. Did you ever know a railroad engineer in estimating the cost of a road which was actually to be built, as distinguished from a reproduction, that did not estimate it as high as ten per cent?

A. No, I should estimate higher.

Q. Higher than ten per cent?

A. I should estimate higher than I would ordinarily; sometimes go as high as 15 per cent.

Q. That is the practice, isn't it, to go from 10 up?

A. I think so. Of course they were not in a position to analyze as closely as I was in this case. (Record 4942.)

Q. Let me get this then. There is a customary practice, is there not, in engineers' offices as to contingencies for work which is to be done?

A. Yes.

Q. And the minimum is 10 per cent on railroad work—the minimum of the total, ten per cent of the total?

A. Yes, I should say so.

Q. Covering lands and everything else?

A. Yes, I should say so." (Record 4947.)

On behalf of the defendants, their chief expert witness, Mr. Hansel, makes an allowance for contingencies amounting to $479,735, being about one-half of the amount allowed by Mr. Riggs. This amount is an average of 5.09 per cent of the Hansel valuation of the schedules which give the Riggs average of 8.8. It was not, however, arrived at by such a percentage application, but by an allowance of 10% on certain schedules, viz: Schedules 3, 16, 20, 29 and 38 to 42 inclusive.

This allowance with Mr. Hansel's explanation of it, constitutes the defendant's testimony on the subject of contingencies. And it is seen that it is all specific, i. e., specifically directed to the question of the amount to be allowed in this particular case; and that on that question, it is only to the effect that the amount named is to be spread on the schedules named in the percentages mentioned, because the witness considers his valuations of those schedules too low to the extent of the respective amounts to be applied to them for contingencies. No testimony is offered by defendants to show that this allowance is based on or is in harmony with, general experience. It stands alone and as evidence it has no direct bearing on the question as to the proper amount to be allowed in this case. Its primary and direct bearing is solely on the question as to the amount that should be added on account of contingencies to the Hansel valuation of the other items and as that amount depends entirely on the correctness of the Hansel valuation, it would

bear on the main question only in case that valuation were adopted as the correct valuation.

What is here said of the probative effect of this Hansel testimony is equally true of the Riggs' testimony insofar as his testimony relates specifically to the amount that should be added to his valuation on account of contingencies. The amount of the allowance for contingencies must be determined not on the testimony of either Riggs or Hansel, as to the amount to be added to his valuation, but on the basis of experience as shown by all the testimony and the law of average. This basis, both Mr. Hansel and Mr. Riggs must be presumed to have employed in determining the amount that he states should be added to his valuation on account of contingencies, and to have supplemented it by a due consideration of the care and accuracy with which his valuation was made up. It is on the same basis of experience as that experience is shown by the evidence, that the court is to determine the amount of the allowance, giving such weight as seems proper to the two facts that Riggs thinks that $918,429 should be added to his other values and that Hansel thinks that $479,735 should be added to his other values.

The question to be determined by the court is not what amount should be added for contingencies to the Riggs valuation or to the Hansel valuation, but what amount should be included in its own valuation, in view of the results of experience as shown by the testimony, including that of Riggs and Hansel.

Upon this question, the evidence is practically unanimous that the contingent costs in producing and reproducing the South Shore property would amount to 10% of all the other costs, meaning construction costs, and that 10% would be a proper allowance in estimating the reproduction of the South Shore property. This is testified to by all of the five engineers called by the com-

plainant and there is no testimony to the contrary. True, Mr. Hansel says, in effect, that the other costs of reproducing this property can be so accurately estimated that a percentage of 5.09 on the other costs would be a sufficient addition to be made for contingencies, but this is only because he thinks he, himself, can make such accurate estimate and has done so.

From the foregoing evidence, I find that in the reproduction of complainant's property, there are costs which are certain to be incurred for certain purposes which can be foreseen, and the amount of which can be estimated with reasonable certainty; that according to universal experience, the total cost of reproducing the property will exceed the total of the costs thus foreseen and estimated by reason of additional costs arising from mistakes and unforeseeable happenings, that these additional costs are by their very nature such that their amount cannot be foreseen or estimated in the manner and with the degree of certainty that the foreseeable costs can be estimated, but that they can be estimated on the basis of general experience and the law of average; that according to such experience these additional unforeseeable costs usually amount to, on the average, from ten to fifteen per cent of the total of the estimated costs of Schedules 3 to 28 inclusive, that, according to the weight of evidence in this case, the amount of such unforeseeable costs to be estimated on the reproduction of complainant's property would be ten per cent of the total of the estimated costs of Schedules 3 to 28 inclusive, amounting to the sum of $782,306; that although an allowance of this amount would be supported by the weight of evidence I do not make such allowance, but in view of the uncertainty pertaining to the subject, and on the principle of resolving all doubt in favor of the defendant, I have decided to allow for contingencies the sum of $400,000, the same being

little more than one-half of the amount last named and more than $79,000 less than the amount allowed for contingencies by the defendants' expert, Mr. Hansel.

I should not feel justified in making this allowance less than the figures fixed by Mr. Hansel were it not for the fact that it is claimed by defendants that certain items of property were valued by both Riggs and Hansel at the cost thereof as shown by the complainant's books of account, and insofar as any such property was bought, acquired, or created so recently that price or value may be deemed to be the same as when valued by the engineers, I think no contingency should be applied. I consider my deduction of more than $79,000 ample to cover such items of property.

This allowance is made against objections from both parties, from the complainant on the ground that it is much smaller than it should be according to the weight of evidence, and from the defendants on the ground that no allowance at all can be made for contingencies in a rate case, and possibly upon the ground also that it is too large, but probably not on the latter, as my allowance is less than the amount which is shown to be proper by the only testimony introduced by the defendants on the subject.

Having thus determined the total amount to be allowed for contingencies in this case, it is unnecessary to consider the schedules separately with reference to it and undertake the task of determinng what part of the total amount may be rgarded as applicable or attributable to each. That task is very difficult, and is considered by some engineers impossible of accomplishment. I think it is impossible, at least to some extent, and I find that even if possible in some cases, it is wholly impossible in this case, for the reason that there is no testimony on which it can be done. The only testimony that applies a conting-

In the foregoing discussion I have arrived at the amount which the weight of evidence shows should be allowed for contingencies in estimating the value of complainant's property. It now remains to consider whether the amount thus shown by the evidence is shown with sufficient certainty to entitle it to be accepted in a rate case.

The defendants claim that it is not, and in the nature of things cannot be so shown; that in a case where confiscation is claimed, as the question is merely as to the value of existing property, there is no room for uncertainty either of inventory or of construction and therefore no room for contingencies; also that if there are contingencies, the errors involved are as likely to be above as below the true value.

This objection, although on its face plausible, involves I think a misconception of the exact nature of the claim for contingencies—a misconception growing out of the fact that the claim for contingencies as mentioned in the inventory constitutes a distinct schedule in consequence of which the objection assumes the claim for contingencies to be a separate and independent item of the inventory to be allowed or disallowed in whole or in part, which assumption is erroneous.

The claim is not a separate item of credit in the inventory but a part of the estimated cost of the entire property, and the form in which it appears, i. e., as a contingency item is a part of the method employed in estimating the entire cost. As it is set forth in the respective inventories of Riggs and Hansel, the contingency item is merely an explanation by the witness who made the inventory and appraisal, of the method by which he reached his total of quantities and values. The witness says in effect that in making his inventory he made accurate measurements and mathematical calculations as far as

possible, but that it was not possible by these measurements and calculations to estimate with accuracy the reproduction cost of the property and its present value, and that for that reason his inventory and appraisal is incomplete and does not fully and correctly set forth the property and its value; that in order that it may do so, it is necessary to add to his other estimates a sufficient amount to cover these uncertainties which cannot be definitely known beforehand, but must be estimated, and that his estimate of the amount to be so added, based on his experience as an engineer, and that of engineers generally, is the amount which he mentions.

It is seen therefore, that his statement relates entirely to the correctness of the inventory and estimates of cost made by the witness offering the inventory; that it is merely a part of his testimony and is to be treated accordingly; that to reject it and take his other estimates as adequately expressing the entire reproduction cost would involve a finding that the witness' other estimates are adequate and correct in the face of his own testimony that they are not so. Such a finding would certainly be very curious, and one for which there is no support in the testimony. In fact, it would be on its face contrary to the testimony and therefore impossible.

The contingency allowance is so essential a part of the witness' testimony as a whole that it is impossible to separate it from the rest and reject it, and at the same time take the other estimates as adequately expressing the value of the whole property.

Those remarks apply equally to the testimony of Mr. Hansel and Mr. Riggs, each of whom makes a contingency allowance; and as theirs are the only inventories and appraisals in the case, it is hard to see how it is possible to make a valuation of the property on the evidence without making an allowance for contingencies.

It is true as claimed by defendants, that the estimates of quantities and values in an inventory may be too large as well as too small but the probabilities in that regard are not necessarily equal, and whether they are greater on the one side or the other, or wholly on one side, will depend on how the estimates are arrived at, that is to say, will depend on how the appraiser deals with the inevitable uncertainties of his task. In dealing with these uncertainties he may take either of three courses, viz: (1) He may undertake to allow for all uncertainties in making his estimate of each item; in which case it would presumably be true that his estimates would be as likely to be too large as too small, or (2) he may instead plan to make each estimate large enough to cover all chance of its being too small, in which case all the uncertainties would be thrown on the side of its being too large, and would require that the estimates be reduced by a percentage deduction, or (3) he may make each estimate small enough to cover all chance of its being too large, thus throwing all the uncertainties upon the other side, and requiring that the estimates be increased by a percentage addition.

Of these three courses, both of the engineers in this case have chosen and followed the third, and this, it clearly appears from the evidence, is the invariable practice of engineers in general.

It will thus be seen that the objection to a contingency allowance in this case is in reality an objection to the method of valuation and of proving value, which is recognized as proper and adopted by both the parties in this cause. The substance of the objection is that proof of value, which involves the inclusion of an allowance for contingencies is not sufficiently certain to meet the requirements of a rate case. It is not claimed that such proof of value is not sufficient to meet the requirements

of an ordinary civil case, but that it does not prove value with sufficient certainty to overcome the presumption of constitutionality in a rate case, i. e., the presumption on this particular point that the legislative judgment of value was correct. The precise question therefore raised by the objection to a contingency allowance is whether value proved in this way is proved with sufficient certainty to entitle it to be accepted as the true value, although the legislative judgment of value presumed to have been found may have fixed a different value.

The answer to this question is found in the preceding discussion of the burden of proof and its requirments in this case. It is there seen that the presumption of the constitutionality of a statute is a rule or principle of inter-departmental comity, observed by the courts in testing the constitutionality of a statute, the rule being that as it is the duty of the legislators to carefully consider the constitutionality of every proposed statute before enacting it, and to refrain from enacting it so long as there is any reasonable doubt in their minds of its constitutionality, the courts will presume that the legislators performed that duty and found beyond a reasonable doubt that the statute was constitutional; and that the courts will not overrule the legislative judgment in that regard until satisfied in like manner beyond a reasonable doubt that the legislative judgment was erroneous. In other words, the principle is that the courts will accord to the legislative judgment the same degree of respect that it was the duty of the legislature to accord to the constitutional limitations by which their powers are circumscribed.

Applying this principle to the case before us, in which the correctness of the legislative judgment is in question and where the question is whether a certain amount should be allowed which amount it is in the nature of

things impossible to determine with certainty; can the court find the legislative judgment erroneous or is the court by this rule of inter-departmental comity required to refrain from forming and giving effect to its own judgment merely because of the uncertainty in the nature of the subject on which the judgment is formed? Must the court, because of such uncertainty defer to the legislative judgment and render it immune from judicial criticism although that judgment is subject to precisely the same uncertainty as is the judicial judgment?

The answer must be that the legislative judgment cannot thus become immune; that the legislative judgment can be no more certain than the nature of the subject will permit, and therefore can be no more certain than the judicial judgment on the same subject, and it therefore is subject to reversal by the latter precisely as are legislative judgments where no such uncertainty exists.

From all the evidence in the case, I am convinced beyond a reasonable doubt, not that the $400,000 which I have allowed for contingencies is the exact amount of the additional costs that would be incurred in the reproduction of complainant's railroad resulting from contingencies, but that that amount is a fair and conservative estimate of the minimum of such additional costs, arising from contingencies not taken into account in the other estimates.

Schedule 38.—Legal Expenses during Construction.

It appears by undisputed testimony in this case that to arrive at the true reconstruction cost and the true present worth there must be an allowance made for legal expenses during construction. And it appears from a clear preponderance of evidence that this element of cost can best be computed upon a percentage of Schedules 3 to 37 and that one-half of one per cent is a reasonable per-

centage to be applied. I have applied this percentage to Schedules 3 to 36 inclusive only, and in such a manner that it will not apply either to the equipment acquired in 1910, 1911, 1912 or 1913, or to any other additions or betterments made to complainant's property during 1912 or 1913, because to a certain extent in valuing this added property the engineers used the cost thereof as shown by the records of complainant, and it is perhaps to be assumed that any legal expense was included in such cost.

I find the value of this item to be:

Passenger	$ 2,529
Freight	16,107
Common	32,804
Total	$51,440

To the foregoing finding under Schedule 38, the defendants make objection (Objection No. 5 (c) (15) to the effect that legal expenses during construction should be estimated on the basis of actual legal expenses during operation after construction, and that, thus estimated, they would be much smaller than my allowance for that item.

Upon the question whether they should or should not be so estimated, there is no direct testimony; nor is there any testimony as to what the amount would be when so estimated. All the testimony on the subject estimates the amount on the basis of a percentage of costs, which of course bears no relation to legal expenses during operation, and necessarily negatives the idea that they should be estimated on the basis of the latter.

And it seems to me entirely clear that the witnesses are right in making their estimates on that basis, rather

than on any amount of legal costs, actual or estimated, during the period of operation.

I can see no relation or analogy between the legal expenses during and in connection with the construction of a property, and those during a similar period of operation of the same property which would make one the measure of the other.

This view is strongly confirmed by the fact appearing in the testimony that in all the state appraisals mentioned, being six in number, among which was the State of Michigan, the appraisal for the state estimated this item on the basis of a percentage of costs, and not only so, but, so far as I can judge, used the same or a higher percentage than that testified to here and on the same schedules.

It is true, as defendants claim, that Mr. Riggs expressed the opinion that the legal expenses of a railroad during operation would probably be greater than the legal expenses during construction, but when his attention was challenged to the actual legal expenses of complainant from 1910 to 1913, inclusive, he repudiated the idea that such expenses could possibly be used as a basis for determining legal expenses during construction. (R. p. 1586.)

The allowance made by me is, I think, fully supported by the weight of evidence, but in view of the inherent uncertainty of the subject, I have decided to adopt the estimate of defendants' expert, Mr. Hansel, of $50,000.

Inasmuch as I no longer use a percentage in the calculation of legal expenses, I make no deductions on account of recent equipment acquired 1910 to 1913, inclusive, or on account of additions and betterments made during those years, especially as I am inclined to think I was in error in the theory on which I originally made

those deductions, as I have explained under Schedule 35, Engineering on Equipment.

This amount I have apportioned between passenger, freight and common on the basis of the allocations of Schedules 3 to 36, inclusive, which results as follows:

Passenger	$ 2,360
Freight	15,740
Common	31,900

Schedule 39.—Organization, Administration and General Expenses during Construction.

All the witnesses who testified on the subject agree that some allowance on account of organization, administration and general expenses during construction is necessary to be made to arrive at the reproduction cost and therefore the true present value of complainant's property.

Mr. Hansel, employed by the defendant, fixes the amount of this allowance at $100,000.00, giving no other reason, so far as I can find from the testimony, than that that appeared to him to be a sufficient amount.

Mr. Riggs, for the complainant, allowed on this account 2% on the value of Schedules 3 to 37 inclusive. Other testimony in the case confirms this allowance as conservative. On these schedules as I have found their value, this percentage would make the amount considerably above $200,000.

The allowance made by Mr. Hansel is less than 1% of my valuation. I think it too small, and I fix $125,000 on account of this schedule, which amount, under the testimony, is extremely conservative. It is less than 1¼% of the schedules affected, and will makes the amounts for this item and legal expenses together less than 1¾%, which percentage the weight of the testimony and all the

authorities I have been able to find indicate is a conservative allowance.

This amount I have apportioned to passenger, freight and common, on the basis of the allocations of Schedules 3 to 36, inclusive.

Schedule 40.—Interest and Taxes during Construction.

All the witnesses in this case agree that one of the items of construction of any railroad property is the interest on money which is expended during the period of construction, while no return is being received from the operation of the property, and that there must be added to the appraisal an amount sufficient to take care of this construction expense. Without this testimony it seems to me too clear for argument that interest during construction is as much a part of the cost and value of any property as the material from which it is constructed.

In *State Journal Ptg. Co. v. Madison Gas & Electric Co.*, 4 Wis. R. R. Com. Repts., 501 (at 542), I find this statement:

> "The element of cost by reason of interest during construction is one which cannot be escaped. It is present to some extent, no matter what the method of financing the construction may be. From the time an investment for construction is made until the completion of the entire plant enables that investment to become active as an integral part of a working whole, there is the element of interest, for that investment is necessarily involved and is necessarily idle until the completion of the plant to a working point. The fact of interest, like the fact of depreciation, is present, no matter what method be employed for the financing of it. This is as true when the money is furnished by the owners as when it is bor-

rowed by them. The theory upon which such interest rests is sound, and remains so even in isolated cases where the investors may decide to charge no interest and choose to donate the same to the consumers in the way of lower charges for the services rendered. Even if the company let a contract for the complete construction of a plant, to be paid for in no part until wholly completed to the operating point, interest cost would come in as a part of the contract price, even though not expressly set forth. In that case the contractor would have to ask a higher price to cover the interest cost. Some additional compensation is needed for the investment made by him during the progress of the work and which is necessarily idle until the completition of the plant. Should the company itself construct the plant and be able to arrange to do the entire work on credit—gathering the material, machines and equipment, labor and everything additional needed on credit, to be paid for at the completion of the plant at the point of operation—the interest cost would enter nevertheless in some form in the entire cost of construction."

Mr. Riggs, the engineer employed by the complainant, was of the opinion that interest during construction should be allowed on every construction item, including land. He estimated the time of construction as three years, and allowed interest on the total of the Schedules 1 to 38 inclusive, for one-half that period of time. This method of computation was approved by several of the other engineers who testified in the case, and it is the method most commonly used.

Mr. Hansel, the expert engineer employed by defendants, undertook to estimate the time during which the money required for each construction account would be

invested before earnings would commence, and he made a schedule based on such estimate.

He assumed that the period of construction would be two and one-half years. He used 6% as his interest rate, and I may here say that all the witnesses testifying on the subject agreed that the money for the construction could not be obtained at a less rate.

His schedule of interest allowances was as follows:

12% on Schedules 1 and 15.
7½% on Schedules 3, 5 and 29.
9% on Schedule 6.
6% on Schedules 7, 8, 9, 16, 35, 37, 38 and 39.
4% on Schedules 17, 19, 22, 23 and 28.
3% on Schedules 10, 11, 12, 13, 14, 20, 21, 26 and 27.

The great weight of testimony is against Mr. Hansel's proposition that the road could economically be constructed and put in operation in two and one-half years. I am convinced from the testimony that it would take more than three years, and I find that three years is the minimum time to be assumed. All the witnesses said more than three years. Insofar then, as Mr. Hansel's schedule of interest charges is based on his assumed time of construction (two and one-half years) it is in error.

We need not consider his allowance on Schedule 1, Right of Way and Station Grounds, because the decision in the Minnesota rate cases settled, beyond controversy, that there can be no interest allowed on such property if valued as of the present time.

Mr. Hansel discusses his interest allowances very fully in his appraisal (defendants' Exhibit 15, page 239, et seq.) and from his statements it is at once obvious that his allowance on Schedules 3 (Grading), 5 (Bridges, Trestles and Culverts), and 29 (Engineering on Roadway and Structures), is based on the assumption that

two and one-half years only would be required for construction.

I think that the allowance on Schedule 6, Ties, is also based on the same assumption, but I cannot be sure of it, nor can I be sure that the rate per cent allowed on any of the other schedules is necessarily dependent upon the time assumed for the complete construction of the road.

In this situation, my inclination would be to apply the complainant's method, using a 6% rate of interest, but as that method assumes an interest charge on lands during practically the entire period of construction, I am not able to determine to my satisfaction for what time the interest charge, under complainant's theory, would apply to the remaining schedules. In this dilemma, I am forced to adopt Mr. Hansel's method, and I use his percentages on the same schedules to which he applied them respectively, except that on Schedules 3, 5 and 29 I use 9% and on Schedule 37 (Contingencies) I compute no interest.

Even on the basis of Mr. Hansel's estimate of two and one-half years for construction, his allowance of 7½% on Schedules 3 and 5 is not sufficient, for the reason that he is incorrect in assuming that the interest charge on these two schedules would be evenly distributed throughout the entire period of two and one-half years. All the testimony in the case shows that the investment in these two schedules would be the first heavy investment after the purchase of the right of way, and that this work would be completed before other work on the roadway could be commenced. He allows one year for track laying and surfacing, and for ballasting, and these operations cannot go on before the grading is finished and the bridges in. If it is assumed that the one year he allows for these operations is an average of only six months, nevertheless, the total investment in Schedules 3 and 5

would be incurred at least six months before the final completion of the road, or two years after starting the work, and a 9% interest charge would necessarily be incurred before the road was completed.

Both the engineer for the defendants and for the complainant figured their interest during construction upon the reproduction value of the property, upon the theory that there could be no depreciation. The argument to support this contention is interesting and perhaps plausible, but I am not convinced that it is sound, and therefore I allow interest only upon the present value which I find.

In connection with this schedule, the claim was made by the defendants that there could and should be net earnings from the operation of completed portions of the line during the period of construction which should be taken into account as a partial offset against these interest charges. In support of this contention they produced the reports of the Detroit, Mackinac & Marquette Railroad to the Commissioner of Railroads of Michigan for the calendar years 1880 and 1881. These reports show net earnings during the construction of 151 miles, which were probably constructed in two years, of $7,711, or $51 per mile for the entire mileage under construction.

This is the only evidence offered by defendants in support of this claim. Does it prove that the net cost of reproducing this road could presumably be reduced $51 per mile through earnings derived from operations during construction? It shows that the earnings from operation during the construction of this part of complainant's road exceeded operating expenses by $51 per mile, and it therefore shows presumably that on a reproduction of the property there could be realized a like amount of net earnings, but it does not show that those net earnings would make the net cost of reproduction less by that

amount. In order to bring about that result, the operation from which these earnings are realized must be so carried on as not to increase the costs of construction over what they would have been had there been no operating during construction.

I find from the weight of evidence that on a reproduction of complainant's property in accordance with the plans, specifications and estimates proposed by either of the engineers in this case, such operations during construction could not be carried on without increasing the cost of construction, and that such increase would be great enough to overcome the amount of net earnings that could be realized from such operations.

To this finding on the subject of interest during construction defendants object (Objection No. 5 (c) (16) upon three grounds, viz: (1) that it is greater than any amount shown to have been expended on account thereof out of capital; (2) that it is greater than any amount which would be expended in case of reproduction; and (3) that it is computed on items valued at actual cost.

The first ground involved an erroneous assumption. It assumes that there is evidence in the case showing the amount actually paid for interest during construction and that the amount so shown is less than that allowed by me; whereas there is no evidence whatever of the amount actually paid for interest during construction. This ground is therefore without foundation. It may be added that proof of the amount actually paid for interest during construction although it might be relevant evidence tending to show the amount that would be required in a reproduction of the property, would not be conclusive or necessary evidence for that purpose. As to the second ground, the question whether the amount allowed by me

is greater than any amount which would be expended in case of reproduction is fully covered in my former dissussion, as what I there undertook to determine and did determine was the amount which would be required to be expended on a reproduction of the property. I, therefore, can only reconsider the amount of the allowance made and see to what extent, if at all, it is too great. This I have done and have found no reason for changing the amount of the allowance.

With reference to the third ground that "interest during construction is computed upon items shown in Exhibit 1 (p. 2) to be included in the inventory at actual cost," I am unable to see its bearing—unable to see how the fact that any part of the property is appraised at actual cost is any reason why interest during construction should not be allowed on that value, unless it appears that an allowance for interest during construction was included in the assumed cost, which, in the nature of things, could not be the case, because interest during construction is an element of cost that accrues after the purchase of the item valued in consequence of unavoidable delay in putting the item to profitable use after its purchase.

Mr. Hansel made an allowance for taxes during construction of $63,709, of which amount $13,709 was on land values, on which, under the decision in the Minnesota rate cases, no such allowance can properly be made. Mr. Riggs included nothing for taxes during construction. It seems to me that a reasonable allowance for taxes during construction is an element of the cost and value of the property which cannot be ignored. Mr. Hansel's allowance is, in my opinion, under the evidence in the case, altogether too small. The evidence shows that the taxes paid each year by the complainant on its Michigan prop-

erty, including lands, exceeds $200,000. An allowance, therefore, of $100,000 on account of taxes during construction on property other than lands seems to me most conservative.

To my finding on the subject of taxes during construction defendants object (Objection No. 5 (c) (17) that no allowance for taxes during construction can be made, basing their objection on three grounds:

1st. That there is no proof that taxes would be paid;

2nd. That there is no proof of what was actually paid during the period of construction of complainant's property;

3rd. That there is no proof of the amount that would be paid in case of reconstruction.

As to the first ground: This assumes that no allowance can be made for such taxes unless the fact that the company would be required to pay taxes on their property in the period of construction, is proven by affirmative testimony, just as any fact requiring to be proved is proven in the case. The question thus raised is one of presumption, i. e., whether the presumption is that the company's property would be taxed during that period or whether the presumption is that it would not. The objection assumes the latter presumption, but I can see no ground for such assumption. The law requires that all such property be assessed for taxes by the proper officers, who, in this instance, would be the State Board of Assessors, and requires the proper officers to enforce payment of the taxes so assessed. So that the question of presumption is simply whether the law presumes that these officers will perform their duty which, to my mind, is no question at all. It is impossible that any court would hold that the presumption is that an officer of the law will not perform his duty, and that therefore the fact that he will do so must be proven by affirmative evidence.

As to the second ground:

It is true that there is no proof of what was actually paid by the complainant for taxes during the construction of their road, but the absence of such proof furnishes no ground for refusing to allow anything for taxes during the period of a supposed reconstruction. If the proof showed that such taxes were paid, and in what amount, that amount could not be taken as the amount to be allowed here, as there would be no presumption that it would be the same, although it might properly be considered in estimating the amount to be allowed here.

As to the third ground:

This evidently assumes that no allowance for such taxes can be made until their amount is shown by direct testimony, but it hardly seems possible that the defendants so intend. No such direct testimony is possible. The amount of what such taxes would be is a matter of estimate, based upon data; and all that could be proven by direct testimony is the facts constituting such data, viz., first the amount in value of the property that would be subject to taxation during the period of construction, and second, the rate of taxation. These facts are shown by, or are deducible from the evidence, and the item cannot therefore be disallowed in its entirety for want of proof. There remains, therefore, only the question of amount.

That question I have reconsidered for the purpose of determining whether my allowance of $100,000 was too large.

Upon the precise question of amount there is no direct testimony except that of Mr. Hansel. He fixes an amount, but in doing so does not undertake to make an estimate arrived at by any calculation based upon data. He recognizes that the estimate of reproduction cost should con-

tain some allowance for taxes during construction, as taxes, in some amount, would certainly have to be paid; but instead of undertaking to arrive at that amount by estimate made in the usual way, he uses an arbitrary and fixes the amount at $50,000. This arbitrary method of fixing the amount is not to be employed unless there is no better method possible. In this instance there is a better method. It is possible from data furnished by the evidence to make a reasonable estimate of the amount. As such data we have the value of the entire amount of property to be reproduced, the period of time covered by the construction, the rate of taxation and the amount of the yearly taxes on the entire property of complainant in Michigan for the years 1910 to 1913 inclusive. From these data it is possible to estimate the minimum amount that would beyond a reasonable doubt, have to be paid.

Taking three years as the period of construction, there would be taxes paid on a portion of the property in each of the three years. The amount of the taxes would depend upon the amount of property which would be subject to taxation in each year. Those amounts cannot be accurately known, but must be estimated. From the total amount there must be deducted the proper amount for land values, as, according to the Minnesota rate decision, that value is one upon which complainant is not entitled to interest during construction, and presumably taxes also.

It will not be accurate to assume that the property will be acquired at a uniform rate during the three years, but it will be sufficiently so for the proposed estimate. Making that assumption, there would be some portion of the property subject to taxation in the first year, but it would be small and will be omitted from this estimate.

In the second year there would be a larger amount, which it is safe to say, would not be less than one-third.

In the third year, there would be a still larger amount which may be safely estimated at not less than two-thirds.

On this basis there would be taxes paid during construction equal to one year's taxes on all the property, which, for the past four years has amounted to more than $200,000 each year. This I consider a fair and reasonable estimate and if it is so my allowance of $100,000 is an amount which would, beyond all reasonable doubt, have to be paid for taxes during construction.

It is possible to make an estimate of the amount of property that would be subject to taxation during construction, based upon Mr. Hansel's testimony with reference to interest during construction, and his estimate in connection therewith of the time required for the construction of the road. The value of Schedules 3, 5 and 29, which are grading, bridges, trestles and culverts and the engineering thereon, as I have found such values, is approximately $3,500,000. It seems impossible that the property in this schedule should not be on two assessment rolls during construction. In one assessment only a portion of its value could be covered and in the other presumably its whole value. Taxes on this item would be $70,000 if it were assessed only one year. It seems impossible that the item "Ties" under Mr. Hansel's testimony should not be on the assessment roll for more than one year. Assuming, however, that it is on for only one year, $6,000 of taxes would fall upon it. The value which I have fixed upon Schedules 7, rails, 8, track fastenings, 9, frogs, switches and crossings, and 16, sidetracks, aggregates $1,885,000, and if only $700,000 of this amount was taxed for one year, it would make up, with the items just above discussed, the full amount of my allowance. There would remain $2,200,000 of physical property, a considerable portion of which would fall under some assessment.

This estimate thus based on Mr. Hansel's testimony shows that my allowance of $100,000 for this item is a very conservative one. It in no way conflicts with Mr. Hansel's allowance of $50,000 for taxes during construction as that allowance was purely arbitrary, and was made, it would seem, from the testimony on the assumption that some special arrangement would be made with the taxing officers by which a portion of the taxes which the property would regularly be required to pay would be waived or remitted.

I therefore find the present value of this schedule to be: Interest during construction, $547,657; taxes during construction, $100,000. The interest item has been assigned to the different services in accordance with the allocations to the different services of the schedules on which the same is computed. The allowance for taxes I have apportioned to passenger, freight and common on the basis of all my other property allocations except lands.

Schedule 41.—Furniture and Fixtures.

I find that the present value of the items contained in this schedule is $9,735.00 all allocated to common. There is no dispute between the parties on this schedule.

Schedule 42.—Stores and Supplies.

Schedule 43.—Working Capital.

In addition to the property embraced in the foregoing schedules, it is necessary for the railroad company to have and keep on hand ready for use, a considerable quantity of money and other property to supply current needs and meet current expenses. Such money and other property together constitute what may be properly called

working capital, and they have generally been so treated in standard works on the valuation of public service corporations and I so treat them here, although in the inventories submitted, money is placed in a schedule entitled "Working Capital" and the other property in a separate schedule entitled "Stores and Supplies".

In Whitten's Public Service Corporations, Vol. 1, Chapter 14, page 288, it is stated that

> "In many rate cases, no mention is made of working capital and it does not seem to have been included at all, except as covered by the allowance for stores and supplies. No rate case has been found, however, in which there is recorded a refusal to allow for working capital."

By my own examination of the cases on the subject, I find no case where the question was involved, either before a court or before a commission engaged in valuing a public utility property, where there was a failure to allow for stores and supplies, nor where the question was directly presented, a refusal to allow for working capital.

It seems to me entirely clear that the stores and supplies which a railroad company, in the ordinary course of its business, keeps on hand for the purpose of carrying on its business, is property upon which it has a right to earn a return.

It appears from the evidence in this case that the Michigan proportion of stores and supplies which complainant had in stock on June 30th, 1913, was $308,502. The complainant contends that this figure should be adopted in fixing the value for this schedule, while the defendants contend that there was an unusual amount of stores and supplies on hand in 1913, and insist that the average of the three years, 1911, 1912 and 1913, would more nearly represent the proper amount. I have concluded to adopt

an average of the three years. I therefore find the present value of this schedule to be $272,811, which should be allocated as follows:

Passenger	$ 2,844
Freight	5,557
Common freight and passenger	264,410

Cash Working Capital.

The defendants claim that no allowance should be made for a cash working capital. I am unable to conceive how the complainant can do its business without a cash working capital of some amount. But I find that courts and commissions have had great difficulty in determining the proper amount to be allowed on this account, and that the proper amount must finally rest in sound judgment.

It is in evidence in this case that the complainant must meet a monthly pay-roll, the Michigan proportion of which is from $120,000 to $150,000. It certainly must keep on hand for other purposes considerable amounts of cash. It is in evidence, further, that its average monthly balance in the hands of its treasurer in the fiscal year 1913 was $205,536. I do not believe that this amount is more than is reasonably required to meet the exigencies of the business of the road, or more than will be required in the future. I have apportioned a portion of this to Wisconsin on the basis of track miles, and I find the Michigan proportion to be $167,107.00, all of which is allocated to common.

The defendants in opposing any allowance for cash working capital contend that the complainant could and should obtain interest on daily bank balances sufficient to pay a fair return on such cash working capital. If it is a fact that such an amount of interest could by proper management be realized on daily bank balances, then that fact would constitute a good reason for refusing any al-

lowance for cash working capital. There is no evidence in the case from which I can find whether such is or not the fact, and as there is no presumption that it is a fact, I cannot on that ground, refuse to allow for cash working capital. Perhaps, on a full trial of this particular question, it would appear that some reduction in the allowance for cash working capital should be made on account of the possibility of earning interest on daily bank balances, but there is no evidence in this case from which the amount of such reduction could be estimated.

Treating stores and supplies as a part of working capital, as in a proper sense they are, my allowance for such total working capital is about 12% of the annual gross business of the company, and I find that the allowance on this account in the reported cases appears to run from ten to fifteen per cent of the gross business.

The amount of stores and supplies shown by complainant's inventory is less than the amount required, because their inventories of stores and supplies are taken as of June 30th in each year, at which time stores and supplies are below the average in two very important items. It is in evidence that the coal supply of the company is brought in during the season of navigation on the Great Lakes, and would be must larger at the close of navigation than on June 30th. It is also to be deduced from the evidence that the ties used each year are in the main produced during the winter months, when timber operations are chiefly carried on in the Upper Peninsula, and are largely distributed on the line and charged out of stores and supplies before June 30th, so that the amount which I have taken for stores and supplies is not the average amount throughout the year, but those on hand at a time when there was less than an average amount of both coal and ties in the inventory.

To the foregoing determination with reference to these

schedules 42 and 43, defendants object (Objection No. 5 (c) (18), on the ground that the amounts allowed for both Stores and Supplies and for Cash Working Capital, respectively, are too large, and claim that the aggregate should have been no more than the amount which was allowed for Stores and Supplies alone.

This objection, it seems to me, views this subject from a wrong angle, and assumes that the question is what amount of stores and supplies and working capital is required to properly carry on the business of complainant's railroad.

Such is not the inquiry. It must be borne in mind that the complainants are entitled to a return on the value of the property actually employed in carrying on their business, and that the inquiry here is, what is the value of that property? The stores and supplies and the cash working capital included by me in the inventory are a part of the property actually employed in carrying on complainant's business, and as such is as clearly entitled to a return as any other part of the complainant's property that is so used.

And it is no more incumbent on the complainant to prove by testimony in the first instance that these amounts are not excessive than it is incumbent upon them to prove that the number of locomotives or cars possessed and used by them is not excessive. The fact that these amounts of property are used by them in carrying on the business presumptively entitles the complainants to a return on their value, unless and until it is alleged and appears by evidence that the amounts are in excess of the requirements of the business. No such issue has been raised in this case, and there is no testimony tending to show that the amounts are larger than are reasonably required for the carrying on of the business. On the contrary, as I have explained in my finding, the evidence

shows that the amount for stores and supplies is the average for three years of the amount actually kept on hand in the ordinary course of the business. And as regards cash working capital, the evidence shows that the amount which I allowed was the average of the monthly balances for the year 1913; that that average was less than the average for the three previous years, and that if I had taken the average for the same years that I did for stores and supplies, my allowance would have been $198,140.

This objection, therefore, asks me to make a finding which there is no testimony to support—a finding that the complainant has on hand and for a considerable time has been keeping on hand a greater amount of cash working capital and stores and supplies than the business requires, although there is no testimony to that effect, but a very strong presumption that the company would be prevented from doing so by the exercise of ordinary business prudence and judgment.

Depreciation and Appreciation.

Depreciation.

In my valuation I have allowed for depreciation on all elements of the property where any depreciation has been shown by the testimony to exist, and the values therein determined are the present values of the different schedules as depreciated.

In the depreciation of those values I have in every instance, with reference to physical property, adopted either the estimate of the same made by Mr. Hansel or that made by Mr. Riggs, and therefore the manner in which each of these values is arrived at, and the amount of reproduction cost and of depreciation may be seen by referring to the testimony of said witnesses.

Appreciation and Going Concern Value.

We have now completed the consideration of complainant's property, as formally inventoried in their schedules. But it is claimed by complainant that the value of the property so found should be increased by two elements of value not yet considered, viz., that which arises from appreciation produced by adaptation and solidification of road-bed and cuts and fills and also the appreciation which arises from the fact that the property is now organized and in operation as a going concern. These additional elements of value it remains therefore to consider.

Appreciation.

This element of value as described by complainant is that which

> "accrues to a railroad from the settling and solidification of its banks, the gradual cleaning out of its cuts, and the sodding of its slopes; and which, element of value comes only by constant work on the roadbed and by lapse of time."

The amount which it is claimed should be added for this element of value was first stated at $650,814; but was afterwards changed to $553,000.

To this claim the defendants object and insist that it should be entirely rejected on three distinct grounds of objection:

1. That on the basis on which it is included in complainant's claims it has already been included in the physical items of the appraisal.

2. That its creation involved no capital expenditure but was paid for out of operating expenses.

3. That there is no sufficient proof that it exists, or of its amount of value.

As the item of appreciation thus objected to is of large amount and might conceivably become the pivotal point in the case, it requires to be carefully considered. The three objections above made will be considered in their order.

1st Objection. This objection involves a misconception of the function of reproduction cost as a basis of valuation. In saying that the "increase in value has already (i. e., in determining reproduction cost) been included in the physical items of the appraisal" it assumes one of two things, viz.: either that reproduction cost new necessarily includes all the elements of value that there can be in the thing under valuation, or else that the process of figuring reproduction cost in a rate case does not end with the determination of cost new, but is carried forward in some way so as to determine what would be the cost of reproducing an old thing with all its peculiarities resulting from use and age. Neither of these assumptions is warranted. The particular element of value here in question does not enter into the property until long after all the cost of reproduction new has been incurred; and it therefore could not possibly have been included therein as claimed in the first assumption. Hence, it cannot be included at all, unless the supposed process of reproduction is continued after the completion of reproduction new through sufficient time and use to bring the thing into its present state of condition old, as is assumed in the second assumption. As this second assumption is involved in the second objection, its correctness will be there considered.

2nd Objection. This objection to the value in question, on the ground that its creation involved no capital expenditure, but was paid for out of operating expenses fails to distinguish properly between value and reproduction cost, and involves the assumption above stated that

the process of supposed reproduction does not cease with reproduction in condition new, but is carried forward to the existing state of conditions old. The objection well illustrates the difference between reproduction cost and replacement cost, and also the reason why, in defining the kind of value required in a rate case. I have defined it as a replacement-cost value rather than a reproduction-cost value. Reproduction cost value is the amount which it would cost to reproduce the thing valued new (as that is the only condition in which it could be reproduced)—replacement cost value is the amount for which the law presumes it could be replaced, i. e., purchased in open market—that amount being determined by ascertaining the cost of reproduction new, deducting therefrom the percentage of depreciation found to be now existing and adding such appreciation, if any, as is found to have resulted from any improvement in the present condition of the property over the condition that it would be in when newly constructed.

This broad distinction thus seen to exist between reproduction cost and present value in a rate case is in this objection entirely lost sight of, where, instead of recognizing it, the objection assumes that the hypothetical reproduction employed here is a reproduction of the property in its present condition as regards depreciation and appreciation and that the value of the property is the net cost of such reproduction. Now, it will be seen that this involves a fundamental misconception of the theory of determining value on the basis of reproduction cost. Such a supposed reproduction would necessarily be assumed to cover a period of about ten years—three years for construction, in order to produce the property in condition new, and seven years of imaginary operation and maintenance in order to produce the property in its present condition as regards depreciation and appreciation; and

the amount of reproduction cost under this theory would depend upon the profitableness of the seven years' imaginary operation. It is evident that such a theory of reproduction cost is impossible of application, and wholly different from the hypothetical reproduction contemplated by the theory now in use of determining value on the basis of reproduction cost. That theory does not concern itself with either the past or the future of the property under valuation; it merely values the property as it exists today without any regard to ownership or method of acquisition, or whether its value or any part of it was paid for out of operating expenses or paid for at all, as all such considerations have no bearing whatever on the question of present value. And in so valuing the property as it exists today, it proceeds upon the assumption that the fair value of the property in its present condition as a basis of rates is the amount which it would cost to reproduce it new less the percentage of that amount which would correspond to the percentage of depreciation from condition new found in the present condition of the property, plus the amount of any element of value possessed by the property in its present condition which was not possessed by it in condition new.

The precise function of reproduction cost in a rate case thus indicated is very clearly made to appear in the following language used in the Minnesota rate decision, viz:

> "When an estimate of value is made on the basis of reproduction new, the extent of existing depreciation should be shown and deducted. If there are items (meaning items of property) entering into the estimate of cost which should be credited with appreciation, this also should appear, so that instead of a broad comparison there should be specific find-

> ings showing the items which enter into the account of physical valuation on both sides."

It is thus the cost of reproduction new (not old) that the theory in question contemplates; and the function of this cost new is to serve as a "basis" on which present value is to be determined by deducting from it the amount of depreciation, and adding to it the amount of appreciation found to exist in the property in its present condition as compared with what would be the condition of the same property when newly constructed.

In this case, the cost of reproduction new of each item and the amount of depreciation to be deducted are found and set forth in parallel columns in the several inventories. The item in connection with which the appreciation in question is claimed is that of grading and is found in Schedule 3. Logically the item should, as stated in complainant's brief, be carried as a part of that schedule as it is an element of the value of the roadway constructed by grading; but it is not so carried by complainant for the reason, as stated in their brief, that " it is an element of value on which no overhead charges should be figured, it having accrued subsequently to the creation of the overheads." Perhaps the item would have received different attention and therefore could have been better carried in immediate connection with Schedule 3, but whether so or not is a matter of form and does not affect the substantial question whether this large amount for appreciation of roadbed should be added to the total value of the schedules, on which question there now remains to be considered the defendants' third ground of objection.

3rd Objection. This objection insofar as it relates to the existence of the element of value in question, is not well taken. There is an abundance of testimony on both

sides to the effect that this element of value exists in the complainant's railroad and there is no testimony to the contrary. It is testified to by complainant's witnesses, Riggs, p. 249; by Young, pp. 865-6; by Cooley, pp. 5713-15, and by defendants' witness, Hansel, pp. 4952-3.

With regard, however, to the amount of the value reckoned in dollars and cents, the objection is more serious. The only testimony which bears directly upon this question is that of Mr. Riggs, found on pages 249-50, as follows:

> "Q. Taking the items in this Schedule 3 which have not been depreciated, the earthwork, grading, for example, at 100 per cent, that is, assumption that the work was in the same condition as if presently graded, confining ourselves now to the grades, cuts and fills?
>
> "A. That is upon the assumption that the work is worth as much as it would cost to produce a new like structure.
>
> "Q. Your appraisal is the cost of reproduction new?
>
> "A. Yes, sir.
>
> "Q. As to its values, as to the value of the cuts and fills of this railroad, as compared with the value of the same cuts and fills if they were new now; I mean measured by service-ability, expense of maintenance, safety and economy of operation, and all those things; what is the truth in that regard?
>
> "A. The cuts and fills on this road are in a condition today of absolute stability due to settlement, due to the fact that all of the erosion by water and various other forms of sloughing and settlement that will take place, have taken place, and that many, or I may say, most of the embankments and slopes of cuts have become sodded over. The roadbed of

the company is in very much better condition today than a new, green, unseasoned roadbed would be.

"Q. Why better?

"A. There will be no settlement, and the expense of maintenance is less, very materially less on an old, well seasoned roadbed that has become thoroughly adapted to conditions of drainage that are formed or created by the construction of roadbed.

"Q. How about the amount of labor required to maintain it, the roadbed, in the condition that the roadbed of this company is in, compared with the same if it were new?

"A. In my judgment, the cost of track maintenance would be increased on an average by the addition of two or more men per section for the first six or seven years, to take care of the work of cleaning out of cuts and of replacing earth around embankments that had sunk down or been washed away."

The objection to the making of a finding of value on the strength of this testimony is two-fold; first, that it is not sufficiently definite to form a basis for such finding, and second, that it was introduced for another purpose, and is now being used as an afterthought for a purpose which was not in the mind of either counsel at that time; and that defendants have therefore had no opportunity to offer opposing testimony.

As an appreciation in value has been shown to exist, and as it is necessary to take that appreciation into account in order to arrive at the true value of the property, and as it cannot be so taken into account until its amount has been proven, it is clear that the question as to what that amount is, ought to be squarely presented and be made the subject of such proofs as either party may desire to offer. In the present condition of the proof, it cannot be claimed by either party that this has been done.

The result is that I am reduced to the alternative of either giving effect to the unanswered evidence of the complainant's witness as claimed by the complainant or else rejecting that evidence as improper or insufficient, and thereby throwing out the claim for appreciation as the defendants claim should be done.

In my judgment, neither of these alternatives would be a fair disposition of the subject of appreciation, as either alternative would tend to deprive one or the other of the parties of the right to a full and fair trial of this question of appreciation.

With regard to the present condition of the proofs on this subject, it cannot, I think, be fairly said that either party has been seriously at fault; and if it can be so said, I think that such fault should not, in a case of this nature, be permitted to stand in the way of a full and fair hearing of the question on its merits—the case being not one in which merely two private parties are concerned, but one in which the entire public is concerned, and in which it is to the interest of all concerned that substantial justice be done.

As the fact of appreciation is proved by uncontradicted evidence, and as there is some evidence of the amount of that appreciation, which evidence is uncontradicted, and as the complainant is clearly entitled to the amount of the appreciation when shown, it seems to be clearly my duty to give effect to the evidence as to the amount of appreciation, and allow the amount thereby shown for appreciation in the value of the complainant's property; but with the recommendation, however, that this finding be neither approved or disapproved without first giving opportunity for a fair trial of the question by the introduction of further evidence by each party.

In estimating the amount to be thus provisionally allowed for appreciation, I find that the amount of $553,000

is too great, that it was evidently computed on the assumption that the extra section men employed on the new road, as compared with those required on an old road, would be employed during the entire year, whereas they would be employed not more than seven months in the year. Computed on the basis of seven months, the cost of such extra employment would amount to approximately $318,000.00 and I have fixed the amount to be allowed for appreciation at $300,000.00.

That my allowance of $300,000 for this item of appreciation is conservative I am fully convinced, in view of the testimony of all the witnesses as to the greatly increased value of complainant's roadbed by reason of adaptation and solidification, and my conviction in this regard finds further confirmation in the fact that in the Mnnesota rate cases, the State conceded that the adaptation and solidification of the roadbed of the Northern Pacific Railroad amounted to the sum of $1,613,612, which was over 15% of the remainder of the grading item as found by the Master, whereas the allowance which I have made is less than 11% of the remainder of my grading schedule.

As to the propriety of this allowance, the only possible question is the above described quetsion as to the sufficiency of the evidence as to its amount. That there has been some appreciation in the value of the property is shown and not disputed; that in order to reach a proper estimate of the value of the property under the method of valuation employed in rate cases, any appreciation in value that has taken place must be added to reproduction cost less depreciation, there is no room for question either on authority or on principle. In such method of valuation, depreciation must be allowed, and depreciation cannot be allowed without the allowance also of appreciation. The two are there vitally and inseparably con-

nected. The latter is the necessary corollary of the former. Every reason which calls for the allowance of depreciation calls equally for the allowance of appreciation. The ground on which depreciation is allowed in such method of valuation is that it is a necessary step in determining the amount that it would cost to acquire the property in its present condition as regards depreciation, it being assumed that the purchaser will be willing to pay for the property, its cost of reproduction less existing depreciation. But to determine value it is not enough to find only what the purchaser will be willing to pay; it is equally necessary to find what the vendor will be willing to accept, and in finding this, it is just as necessary to allow for appreciation as it is to allow for depreciation in finding what the purchaser would be willing to pay. In this case the allowance for depreciation on the entire property amounts to a very large sum—being in excess of $2,000,000, and it is allowed because it appears that such depreciation exists. But it also appears that while that depreciation was taking place, some appreciation was also taking place, and it would be a manifest injustice and an irrational application of the method of valuation employed to deduct $2,000,000 from reproduction cost on account of existing depreciation and fail to add anything on account of existing appreciation.

It is for this reason, viz., that the valuation would be clearly incomplete and unjust if no appreciation is allowed, that I have made the above allowance and recommendation.

Going Concern.

The claim of an amount to be allowed in the valuation, because the property constitutes a going concern must be rejected for two reasons, either of which is ample. In the first place, if there is any such value, there is no proof

from which the amount of it can be found. In the next place, any such value, if found, must depend directly upon rates and would therefore be a kind of value that can find no place in a rate case. The "Concern" could not be made to "go" at a profit unless the rates permitted it, and, given the business, the higher the rates, the greater the profits, and the greater the profits, the higher the rates insofar as the rates would be predicated on a going concern value.

By the courtesy of counsel for defendants, my attention has been called to a decision rendered by Judge Sessions in the case of the Ann Arbor Railroad Company vs. Grant Fellows, et al., wherein the question of the allowance for certain costs therein called "Overheads" was involved.

From a careful study of that entire opinion, my conclusion is that the learned Judge, notwithstanding that he used expressions with reference to contingency allowances, that might at first blush seem to be of general application, did not therein intend to lay down any general rules or principles applicable in all rate cases either to contingencies or to any other so-called overhead allowance, but that in his remarks he was confining himself entirely to conclusions to be drawn from the testimony in that case.

Deductions from Inventory by Reason of Property Located in Michigan, but Which is Also Used for Wisconsin Operations.

The general shops of the complainant are all located at Marquette, in Michigan, and perform work for the railway system as a whole. Defendants contend that a proportion of the value of these shops should be deducted from the Michigan value and assigned to the Wisconsin business. They also present the same argument as to

the Thomaston round-house, which is near the border line between Michigan and Wisconsin, and which houses locomotive that run in Wisconsin, as well as locomotives that run in Michigan.

In recognition of this contention, I have deducted from my Michigan values the portion of the value of the general shops which should be attributed to the Wisconsin business, using as a basis for arriving at this apportionment the percentage of miles of main line track of the complainant in Wisconsin to complainant's total mileage of main line track, viz., 18.3%. I have applied this percentage to the different items of these shop buildings, of the land on which the shops are situated, of the sidetracks used in connection with the same and of the machinery therein.

As to the Thomaston round-house, the engines housed there run as far west as Superior, Wisconsin, and as far east as Marquette, Michigan. I have therefore deducted from the total value of this round-house and of the land on which the same is situated, the portion of such value which should be attributed to the Wisconsin business, using as my basis for this apportionment, a percentage derived from the relation of the miles of main line track from Superior to the Wisconsin and Michigan State line to the total miles of main line track between Superior and Marquette, viz: 41.9%.

The total deductions from the inventory by reason of these apportionments of values to the Wisconsin business amounts to $42,459, all of which has been deducted from the property of the complainant in Michigan. To these deductions I have also added all overhead charges computed upon the same, amounting to $1,449, making a total deduction of $43,908.

The detail of these deductions is as follows:

Schedule.	Total Value.		Assigned to Wisconsin.
1. Lands on which Marquette shops and tracks used in connection therewith are located	$23,252	18.3%	$ 4,255
1 Lands (Thomaston round-house)	130	41.9%	54
16 Shop tracks and switches at Marquette and Thomaston			4,403
19 & 28 Shop buildings at Marquette used for general purposes	51,678	18.3%	9,457
19 Round-house at Thomaston	18,804	41.9%	7,879
20 Shop machinery and tools	89,676	18.3%	16,411

The allocations of these deductions are as follows: Passenger $102. Freight $720. Common $43,086.

The totals above given, and also the details, differ from those given in my tentative report, for the reason that, having adopted the estimate of defendants' expert, Mr. Hansel, of $50,000 for the legal expenses in Michigan, the overheads on these deductions were necessarily changed, and also because, through a clerical error, 41.9% of the shop tracks at Marquette had been assigned to Wisconsin instead of the 18.3% thereof which I intended to assign, and certain tracks at Marquette and Thomaston had been omitted.

In addition to the above deductions, I have, as explained under Schedule 17, deducted from that schedule $1,685 on account of the Marquette passenger station,

the second story of which is used and occupied by operating officials and their clerks.

Inasmuch as this property is all located in Michigan, is taxed as Michigan property, and is necessary for the performance of the Michigan business, and would be just as necessary if there were no lines of complainant in Wisconsin, I am in grave doubt as to whether the entire value of such property should not be assigned to Michigan. I have, however, in this intsance, as in all others, followed the rule of resolving doubts in favor of the defendants.

Exclusion From Inventory Claimed by Defendants.

The defendants claim that the inventory of complainant's property should not contain any property or values of the following description:

1. Property not in public service.
2. Property furnished by industries.
3. Property used by others.
4. Value of clearing and grubbing.
5. Property contributed by the public.
6. Property of the Mackinac Transportation Company.
7. Property supported by interest or sinking funds.
8. Property newly acquired.
9. Property created by operating expenses,

and that whenever any such are included, they should be deducted.

Of these several descriptions, numbers 1, 2 and 3 are covered by the principle adopted and adhered to throughout this report that only such property is to be included in the inventory as is in use in the service to which the rate in question applies.

Numbers 4, 5 and 6 have been dscussed under their respective schedules.

As regards 7, it is, of course, true, as a principle, that when the return to which the company is entitled on the value of a certain piece of property is realized to any extent in the form of interest paid directly to bondholders or others, such interest will constitute *pro tanto* the required return on the property, and to the extent that it does so, the property is not entitled to a return in railway fares. But there is no property in complainant's inventory that calls for the application of this principle, as the only property against which the defendants aim this claim is the complainant's one-third interest in the International Bridge at Sault Ste. Marie,—a property that can have no effect upon this case, as it is all allocated to interstate.

Numbers 8 and 9 are covered by what was said relative to Numbers 1, 2 and 3; and also by the principle likewise adhered to in this report that all property should be included in the inventory that is in railroad use in the service to which the prescribed rate applies without regard to its ownership or to the time or manner of its acquisition. It must be constantly borne in mind that this case involves three main questions and only three, viz., (1) What is the value of the property used in rendering the service to which the prescribed rate applies? (2) What will be the probable net earnings derived from the use of the property under the prescribd rate? and (3) Will those net earnings be sufficient to constitute a fair return on the value of the property? and that therefore the case involves only such subordinate questions as are necessarily involved in determining these three main questions. As the purpose of the inventory is to determine the value of all the property employed in the service, all the property so employed should be included and the

question whether any particular property should be included or excluded depends entirely on whether it is so employed. In a number of the claims made by defendants in the case, this principle seems to have been lost sight of; for example, amongst the claims above enumerated, numbers 5, 8 and 9 assume that the question whether certain property should be included or excluded does not depend on whether it is so employed, but upon something else; that although so employed, the property should be excluded if it was donated by the public, or was recently acquired or was created out of moneys which had been charged up to operating expenses. These claims assume that the issue to be tried here is not whether the prescribed rate will pay a fair return on the value of all the property used in rendering the service to which the rate applies, but whether it will pay such return on only some portions of that property—that some portions of the property so used have been acquired in such a way that the company is under obligations to donate the use of them to the public, and that they should, therefore, be excluded from the inventory, and also that we must here inquire into and determine all such questions as may thus be raised. In my judgment, all claims of this character in a rate case are entirely irrelevant. In a rate case, the status of the company in its relations to the state and to its property is defined and determined by the law under which the company is organized, supplemented by existing constitutional guaranties and not by the innumerable other considerations which might otherwise be urged as bearing on the general equities as between the company and the public.

If this view is correct, the claims numbered 5, 8 and 9 are irrelevant. But in any event they are in my judgment, not sustainable. As regards No. 5, that property donated should be excluded—this claim is based on a

theory that where complainant receives property as a gift, it thereby becomes obligated to use the property in the public service without charge. Such a theory is self-contradictory. It is of the very essence of a gift or donation that the thing donated becomes the property of the donee with the right to its full beneficial enjoyment and free from all obligations. If, in receiving the property, the recipient becomes bound to perform some obligation imposed by the terms of the grant, the acquisition is not a gift, but a purchase. Certainly no such obligation as is claimed can be held to arise by implication from a gift or donation.

Claims number 8 and 9 might be relevant to the question as to what should be taken as a typical year as a basis for forecasting the future, but not to the question of exclusions from inventory. Thus, as regards number 8, if, in a certain year, a large amount of property newly acquired, the rate of return on the value of the property in that year might be thereby rendered abnormal to such an extent that the results of that year could not be used without modification as a basis for forecasting the future, but that fact would furnish no reason for excluding the property from the inventory.

Similarly, as regards Claim Number 9, if it appears that some portions of the property inventoried were purchased with money that was charged up to operating expenses in some particular year, it is clear that such charge was improperly made; that in consequence the accounts do not correctly show the operating expenses for that year and should be corrected; but such error would furnish no ground for excluding the property so acquired from the inventory, nor would it have any relevancy to this case, except as it would have a bearing on the question of using the results of the particular year

in which the error occurred as a basis for forecasting the future.

To the foregoing disposition of their claim with reference to property alleged to have been created out of operating expenses, defendants object (Objection No. 6).

Objection 6. This objection assumes that there is certain property in the inventory which was purchased by the company and paid for with money that was charged up to operating expenses, and claims that all such property must be omitted from the inventory, because it was thus purchased and paid for.

The question thus raised is covered by the principle adopted and uniformly applied by me throughout the case that the property on the value of which the company is entitled to a return is the property used in rendering the service to which the prescribed rate applies, without any regard to the ownership of the property or how that ownership was acquired.

If there is, as assumed, property contained in the inventory which was paid for by the company out of moneys which were charged up to operating expenses, the effect and only effect of that would be that the account of operating expenses for that year would be too large by that amount; but that would constitute no ground for excluding the property from the inventory or have any bearing on the question whether it should or should not be excluded.

I am again referred to the case of Cumberland Telephone Company vs. Railroad Commission, 212 U. S. 424, as authority for defendants' contention that property purchased or created out of operating expenses must be excluded from the inventory in this case.

I have carefully considered this case, and I cannot find

that it involves any such question or that there is in it any decision showing or tending to show that where a valuation is involved, property acquired out of operating expenses is not to be included in the inventory.

In that case the State claimed that the accounts of the company showed that it was demanding a return upon its impaired capital as though the same were unimpaired, and, in addition, was demanding a return upon a depreciation fund created for the express purpose of making good the impaired capital. In a case involving valuations this would clearly be the equivalent of duplicating property values.

The lower court held that the burden was upon the state to prove that the accounts did so show. The Supreme Court reversed the case, upon the ground that the burden was upon the company.

Division of Common Property Between Passenger and Freight.

After assigning to the two services respectively all the property that can be allocated to either there is a large part of the railroad's property which is used in common by the two services in such a way that no part of it can be assigned to either service as being used exclusively therein. But it is necessary to determine what portion of this common property the passenger earnings should pay a return upon and therefore necessary to find some basis for dividing the same between the two services.

In the Minnesota rate cases, the common property was divided in the lower court on the basis of the gross earnings in each service; but this method was distinctly disapproved by the Supreme Court on appeal and the question as to what the basis of division should be was thus left and still remains an open question. As bearing upon the question, however, the court there stated as follows:

"When rates are in controversy, it would seem to be necessary to find a basis for a division of the total value of the property, independently of revenue, and this must be found in the use that is made of the property. That is, there should be assigned to each business that proportion of the total value of the property which will correspond to the extent of its employment in that business. It is said that this is extremely difficult; in particular, because of the necessity for making a division between the passenger and freight business and the obvious lack of correspondence between ton-miles and passenger-miles. It does not appear, however, that these are the only units available for such a division; and it would seem that, after assigning to passenger and freight departments, respectively, the property exclusively used in each, comparable use-units might be found which would afford the basis for a reasonable division with respect to property used in common."

I think that in this expression, the Supreme Court recognized the difficulty, if not the impossibility, of dividing the property with mathematical accuracy and required only the making of such a division as would, all things being considered, be fair as between the two services.

For a number of items of the common property bases of division may be found from the evidence which are satisfactory to both parties and are agreed to by them. The items and the bases agreed upon are as follows:

Schedule 23. Fuel Stations: It is agreed that the items in this schedule should be divided on the basis of the amount of coal consumed in each service respectively. This division, using the figures of 1913, assigns 29.56 percent of the whole to the passenger service.

Schedule 22. Water Stations, it was agreed might be divided on the same basis as fuel stations, and I so find. The division assigns to the passenger service 29.56 per cent.

Schedule 10. Shops, Engine Houses and Turn Tables, it was agreed, might be divided on the basis of locomotive housings, and I have so divided them.

It was agreed that the following, viz:

Schedule 20, Shop Machinery and Tools;
Schedule 21, Roadway and Construction Tools; and
Schedule 42, Stores and Supplies,

might be divided on the basis of the relation between all the other assignments made to freight and passenger. I have so divided them and such division assigns 30.22 per cent to the passenger service.

Schedule 43. Working Capital I find should be divided on the same basis as the schedules last above mentioned.

The detail of these divisions will be found on page 2 of Exhibit 1, hereto attached.

By these methods we are thus able to divide the common property embraced in the foregoing schedules; but such property is but a small part of all the common property. The great bulk of the common property remains to be divided, and as none of the methods of division above employed are applicable to it, some other method or basis of division must be found. It is tacitly recognized by both parties that any basis of division that will properly divide any part of this remaining property, will divide all of it, and a different basis for such division is proposed by each of the parties.

Before considering these proposed methods, let us recur again to the language above quoted from the decision in the Minnesota rate cases and see precisely what it is that we are required to do. From the language there

used, it is seen that we are required to divide the common property between the two services in proportion to the use of the property made by each service, and in order to find such proportion, we must measure the use made by each, and in doing so, must employ such units of measurement as will enable us to compare the extent of the one with that of the other, i. e., by comparable units of use. The first step therefore, in the task of making this measurement is to find comparable use-units. What are the units of use that will answer this purpose? To this question, the counsel on each side in this case have proposed an answer in the method of division which he proposes, which is as follows: On behalf of complainant, it is claimed that the use to be measured consists of the moving of revenue producing trains, and that the division is to be made on the basis of the distance (measured by miles) traveled by the trains in each service which earn a revenue, i. e., on what is known as the revenue train mile basis, the mile being the unit of measurement. On the part of the defendants, it is not disputed that the use to be measured is that which is involved in the movement of revenue trains, but it is claimed that that use should be measured, not by the distance moved by the trains, but by the time occupied in their movement.

As between these two methods of measurement, we are, of course, to accept and employ the one that will most accurately measure the extent of the use.

Now it is evident that each of these two kinds of units will, in a certain way, measure the extent of the use, but not in the same way. The extent which one will measure is not the same extent which the other will measure. The fact is that the use in question has two kinds of extent—an extent in time and an extent in space—and the two kinds of units of measurement pro-

posed, correspond to these two kinds of extent. Our choice between these two kinds of measurement therefore, depends wholly on which of these two kinds of extent it is that we wish to measure. What kind of extent is it that we want to measure—that of time or that of space?

In seeking to answer this question, we find that what we have to choose between is not in reality two kinds of extent, but two kinds of use, viz., a movement use and an occupancy use. The extent in time which the defendants propose to measure by a unit of time is an occupancy use, and the extent in space which the complainant proposes to measure by a unit of distance is a movement use. Both of these two kinds of uses are involved in the operation of trains, and the question is, which kind of use is it that we should measure for the purpose in hand? The obvious answer to that question is that it is the principal use, the particular use, which most directly and effectually accomplishes the purpose or object sought to be accomplished by employing the property. That purpose is, the transportation of passengers and freight from one place to another, and this being so, the principal use is, of course, the movement use by which that transportation is accomplished. This use involves, in some degree, an actual physical occupancy, and therefore an occupancy use, but that occupancy use is incidental and subsidiary to the movement use, and is of only a very small portion of the property during a very small part of time. The extent of time of this fitful, transient and partial occupancy clearly afford no reasonable measure of the use of the property made by each service in the operation of its trains, although it might do so under other conditions, where time of occupancy was important and the one service was curtailed or otherwise affected

injuriously by the continued exclusive occupancy of the property by the other service.

Time of occupancy may be, and frequently is the true measure of the extent of a use, as for example, the use of money which is paid for in interest computed on the basis of time, or the use of property which is paid for in rent, also computed on the basis of time. In fact, it is just such a use of property to be so paid for on a time basis that we are trying to apportion, viz., the joint occupancy or use of all of the common property all of the time by the two services, freight and passenger. This joint use it is that the public is required to pay for in freight and passenger tariffs—the whole amount to be paid by both services being in the nature of a rental and being determined by the value of the common property and the rate of return allowed, computed on a time or per annum basis. It is for the purpose of determining what part of this joint rental each service should pay that we are here trying to divide the common property. And it is just because the occupancy is joint and not several or separate, that we are confronted with this problem. If, instead of being the subject of a joint occupancy, all the property in question were alternately occupied separately and exclusively by each service for a certain length of time, so that the combined time of all the exclusive separate occupancies equaled the time for which the public is required to pay a return on the so-called common property, the amount in the nature of rental, which each service should pay could be determined just as the entire amount of return is determined, i. e., on a time basis—each would pay in proportion to the time of its exclusive occupancy. But such is not the case. There is, in fact, a kind of separate exclusive occupancy by each service involved in the operation of the trains under consideration, but it is not an occupancy of the entire

property at any time or of any portion of the property for any definite time, but only of a very small portion of the property during a very small and indefinite fraction of the time. I cannot see how it is possible to make any rational apportionment of the whole of this joint occupancy between the two services on the basis of the time consumed by each in a series of momentary separate occupancies of small fractions of the property such as are involved in the movement of trains. The attempt to do so involves the making of an impossible combination of two unrelated bases of division, viz., the time basis (which can be used only where there is an occupancy sufficiently continuous to furnish the basis) and the basis of a particular use, viz., the train movement basis.

The fact is, that what is here called "time of occupancy" is in reality the exact reverse of that. Instead of time of occupancy, it is occupancy of time. It is an occupancy, not of certain property during a certain time, but of a certain time in accomplishing a journey or movement. The length of time which is proposed as a basis of division is that which is consumed in accomplishing a train movement. If a freight train or a passenger should stand on the common property for days or weeks, it would constitute an actual occupancy but the time of such occupancy would not here be taken into account at all. It is only train movement that is taken into account and movement can be measured only by a unit of distance. What the defendants here in reality undertake to measure is not the extent of a time of occupancy but the extent of time consumed in making a movement an extent which bears no necessary relation to the extent of the movement. To graduate the charge for the privilege of moving a train 100 miles on the common property in proportion to the time consumed in making the movement instead of on that of the distance moved,

would be irrational. It would be the same in principle as though a tollroad company should charge a horse and carriage for a journey of ten miles the same amount that it charged an automobile for a journey of fifty miles for the wholly irrelevant reason that each journey consumed the same amount of time. In the one case as in the other, the use, the extent of which is to be measured is a movement use; the extent of a movement use is an extent in space or distance and the unit by which such a use is to be measured is therefore of necessity a unit of distance.

In addition to the foregoing, it may be noted also, that in this case, the so-called time of occupancy referred to is practically of no consequence, because each service has a great superabundance of time in excess of its needs. The aggregate use of the common property made by both services is far within the capacity of the property for such use, and therefore, neither service either benefits itself or injures the other by occupying the property or a part of it during a longer rather than a shorter time. Under these conditions, it is clearly of no consequence to the passenger service whether the freight service in running a train fifteen miles, consumes one hour or three or any other number, so long as it does not curtail nor trespass upon the time required by the needs of the passenger service; and there is, therefore, no reason why the freight service should be charged with a greater amount by reason of the longer time so occupied. Nevertheless, if the extent of time consumed is to govern, where the passenger trains average thirty miles an hour and the freight trains fifteen miles the freight service would be chargeable with double the amount chargeable to the passenger service, and without any basis in equity or reason. That the proposed application of the time basis here would lead to such anomalous results is even more

apparent when it is remembered that the rapid movement of the passenger train consuming a short time is immeasurably more valuable to that service than would be the slower movement of the freight train, and that at the same time this more valuable movement would be made to cost one-half as much as the less valuable movement would cost. In other words, if the average speed of the passenger train were reduced to fifteen miles per hour, its efficiency and value would be greatly reduced and at the same time its cost (in this particular) would be increased by 100%.

My conclusion is that the extent of the use made by each service of the common property in the operation of revenue trains is to be measured by the distance moved by the trains and not by the time consumed in making this movement; that the unit of use is therefore, a distance unit; and that the property is to be divided on the basis of the number of miles traveled by the trains in each service respectively.

A further, and it seems to me a very cogent reason for choosing the distance basis of division rather than the time basis consists in the fact that the time basis is, on closer examination, found to be in conflict with the statute itself, which we are here considering, while the distance basis is in harmony with it.

The statute itself, although it does not, in terms and directly make the division in question, does make it in effect and indirectly, and makes it on the basis of distance. It does this by prescribing on the basis of distance transported the amount to be paid by each of the two classes of users of the common property in the two services. Thus, it provides that the amount to be paid by the passenger service for all its expenses, including its share of the reasonable return on the value of the common property, shall consist of the passenger fares re-

quired to be paid by each of the individual users of passenger property (both exclusive and common) and these fares are fixed, not at the rate of so much per hour or other unit of time, but at the rate of so much per mile of transportation without regard to the time consumed in effecting the transportation.

Here we have the judgment of the legislature as to the amount that is to be paid for the use of the passenger property both by the individual user and by all the users collectively—the latter being the sum total of the former; and it is an amount that is determined not by the extent of time during which the passenger is in transit, but by the number of miles that he is transported. The amount to be paid for a journey of 100 miles is precisely the same, whether it consumes two hours or a dozen.

And this judgment of the legislature thus embodied in the statute and employing the basis of distance is there followed by another and similar judgment in which also, the distance basis is employed. Recognizing the fact that owing to differences in conditions of different railroads, the amount to be paid per mile by each passenger should be greater on some roads than on others, the legislature adjudged that on some roads 2¢ per mile would be fair to the public and would yield a fair return on the value of the property employed, and on the other roads a rate of 3¢ per mile would fulfill these requirements; also that the roads on which a rate of 2¢ per mile will yield a fair return upon the property employed in the passenger service are those on which the gross passenger train earnings equal or exceed $1,200—not for every hour or other unit of time consumed by the passenger train—but for every mile of road on which passenger trains are regularly operated without any regard to the time consumed in the movement of such trains. That we are bound to presume that the legislature formed and ex-

pressed these judgments thus embodied in the statute there can, of course, be no question. Nevertheless, it is claimed in this case that we must here presume that the legislature, in forming these judgments and reaching these conclusions apportioned the amount to be paid by each service for the use of the common property on the basis of the time consumed in the movement of its trains, and as the passenger trains move rapidly and the freight trains slowly, it consequently apportioned a much greater amount to the freight service than to the passenger.

I cannot conceive how it would be possible to presume or believe that the legislature did this, even if the statute contained nothing to the contrary, and still less can I do so when, as here, the statute indicates quite clearly that a different course was pursued.

If the legislature divides the use of the common property on the basis of time of occupancy it should, in order to be consistent, and in fairness to the traveling public and to the company and to the railroads, require the two classes of users to pay for the use made by each on that basis, also, i. e., in proportion to the time occupied by each respectively. Instead of being required to pay so much per mile of distance transported without any regard to the time during which he occupies a seat in the car, a passenger should be required to pay so much per hour or other unit of time for the time during which he occupies a seat in the car, without regard to the distance that he is transported. If it is time of occupancy that constitutes the use, he should be required to pay at the same rate per hour, whether the car in which he occupies a seat is traveling at the rate of thirty miles an hour or fifteen miles, or indeed is standing still on a common side track, the use in either case being the same.

The division of property and the rate charged should certainly harmonize and be consistent with each other,

and when thus made to harmonize the company would doubtless be quite satisfied with the division on the time basis, as it would leave them at liberty to increase their passenger earnings *ad libitum* by simply decreasing the speed of their passenger trains.

The conclusion that the revenue train mile and not the revenue train hour is the proper method of measuring the extent of the use and of apportioning the burden of expense and therefore of dividing the property is supported by the weight of expert opinion, and by judicial authority. It is supported by the testimony of a large number of witnesses, who have testified in this case, having an intimate knowledge of, and a large experience in the practical operation of railroads, and it has the sanction of judicial authority, it having been adopted and used for the division of common expenses in the very recent case involving the Illinois 2¢ rate law. Trust Company of America vs. Chicago, Peoria and St. Louis Ry. Co., 199 Fed. 592-595.

That case I regard as in point here although the division there made was of common expenses and not of property; because the division here, although called a division of property, is not such in fact, but is instead merely a division of the burden of paying a fair return for the use of the common property, which is nothing more or less than one of the expenses attendant upon the rendition of the service.

I have thus considered this subject of dividing the common property at very considerable length because it is one of the most important and difficult questions in the case.

Proceeding now to the practical application of this train mile basis to the purpose in hand, we encounter, at the outset, a question as to what mileage precisely that basis ought to include. In the application of it originally

made in the case by complainant, it did not take into account any of the mileage made in switching operations. To this omission, the defendants object specifically and insist that in any appliaction of this method of division all switching mileage must be included.

This objection raises some difficult questions. If switching miles are properly classed as train miles, such of them at least as are made on the common property should, of course, be included in the basis on which the division is to be made. The question whether they are properly so classed need not be considered here as the complainant is willing to concede that they be here treated as such. It does not concede, however, that the switching miles to be so treated are, as claimed by defendants, either as regards total number or number made on the common property, and various questions are raised in this connection which it is necessary to consider.

Inasmuch as by far the greater part of the switching mileage is made in the freight service, the effect of including that mileage is to increase the freight train miles and thereby throw a greater percentage of the property and expenses on the side of the freight service. The division of common property arrived at by complainant by applying the train mile basis without switching mileage, assigns to freight 52.96 percent and to passenger 47.04. The division arrived at by defendants on what they call their modified train mile basis, i. e., modified by including switching mileage, assigns to freight 65.31 percent and to passenger 34.69.

In reply to this claim of defendants, the complainant claims that if the train mile basis is to be modified by the inclusion of switching mileage, the modification thus proposed by the defendants is defective in three important respects, viz.,

1. That it assumes that all of the 32.2 percent of the elapsed time of freight trains that the evidence shows is spent in stational work is spent in switching operations, although the evidence shows that at least one-third of that time is spent by the trains in standing still, while unloading less than carload freight.

2. That it assumes that switching movements are made at the same rate of speed that is made by trains while running on the road, when, in fact, the switching mileage is computed on a time basis, in which the speed assumed is 6 miles per hour, and the average speed of freight trains running between stations is sixteen miles an hour.

3. That the greater part of the switching done by both road engines and yard engines is done on exclusive freight tracks, which are not common property, but have been allocated to freight, and the expenses of maintenance of which have been assigned as freight expenses.

In dealing with the questions thus raised, it is to be borne in mind that here, as in so many instances elsewhere in a rate case, it is impossible to be accurate, and difficult even to estimate, but that it is nevertheless necessary to approximate the truth as nearly as possible. And it is clear that an estimate of the amount of switching mileage that makes a reasonable allowance for time spent at stations in unloading less than carload freight and also computes the switching mileage on the basis of six miles an hour instead of sixteen miles, will more nearly approximate the truth than an estimate that does neither of these things. And it is equally clear that the mileage basis on which the common property is to be divided should not include mileage that is not made on the common property, but on exclusive freight property, and that, as the switching mileage is mostly made in the freight service a considerable portion of it is made on

exclusive freight tracks. Exactly what portion of it is so made, it is impossible to determine and very difficult to estimate, as all switching operations involve more or less use of the common property from or onto which the cars are switched, and on which the locomotive must do more or less traveling in accomplishing the switching operations. But an estimate which makes a reasonable allowance for mileage on exclusive freight tracks will approximate the truth more nearly than one that does not make such allowance, and should, therefore, be preferred to the latter.

As furnishing such a preferable modification of the straight mile basis, the complainant presents an estimate in which it undertakes to make such reasonable allowances and corrections and by which they arrive at a division of the common property in which, for the year 1913, 57.01 percent is assigned to freight and 42.99 to passenger, and for the average of the four years 57.52 to freight and 42.48 to passenger.

The allowances made in this estimate seem to be reasonable and the estimate thus presented I find to be a fair approximation of the amount of mileage to be included on account of switching operations as part of the train mile basis of division.

I will now explain in detail how the ratios above mentioned are arrived at, using, in illustration, the figures of the year 1913.

The purpose of the modification of the straight revenue train mile basis is to add to the number of revenue passenger and revenue freight train miles, respectively, a proper number of miles to represent the miles made by engines in switching operations in each service. The accounts kept by the complainant in accordance with the accounting rules of the Interstate Commerce Commis-

sion divide switching into two classes, one called road switching and the other yard switching.

Road switching is the switching done by road locomotives at way stations in connection with their business of delivering and receiving freight thereat. Under these accounting rules, this road switching is calculated at six miles per hour for all the time spent by the train at a station above one hour.

Yard switching is the switching done by switching locomotives at the terminals where they are employed, estimated by reckoning the time such engines are in service at six miles per hour.

It is obvious that, under these switching rules, no attempt was made to estimate the actual miles of road switching, because, even if switching were done at a station, it would not be reported except for the excess time above one hour. It becomes necessary, therefore, to estimate the actual road switching.

It appears undisputed from the evidence that of the total elapsed time between terminals of all freight trains (other than trains carrying ore to the Marquette docks) 32.2% is spent at stations doing switching, unloading less than carload freight, waiting for leaving time, or waiting for orders. The exact proportion of this time at stations actually spent in switching operations is not directly shown, and must therefore be estimated, but it appears that for a considerable portion of the time while package freight is being unloaded, or the train is waiting for its leaving time, or for orders, the locomotive is doing no switching, but is idle, and it would seem a very conservative estimate to figure this idle time at 15%, leaving 85% of time during which the locomotive is estimated to be actually engaged in switching operations.

To get the time consumed in road switching, it is necessary to convert this 32.2% stational time into terms of

hours. If we consider the entire road time as 100% and the stational part there of at 32.2%, the running time will be the difference between these two percentages, or 67.8%. This 67.8% of time is consumed in running 804,917 miles, being the total revenue freight train miles less the mileage of ore trains, which do no stational work. As the average speed of these freight trains is sixteen miles per hour, this 804,917 miles represents 50,307 hours running time. The total time, therefore is 74,214 hours. 85% of the stational part thereof is 20, 321 hours and the total number of road switching miles reckoned at six miles per hour is 121,926.

Recapitulation.

Revenue freight train miles	865,096
Deduct ore train miles	60,179
Freight train miles other than ore	804,917

Entire time of freight, other than ore trains	100%
Time at stations of freight other than ore trains	32.2%
Running time of freight, other than ore trains	67.8%

804,917 miles at 16 miles per hour	= 50,307 hrs. running time.
50,307÷67.8×100	= 74,214 hrs. total time.
32.2% of 74,214 hours	= 23,907 hrs. time at station.
85% of 23,907 hours	= 20,321 hrs. switching time at stations.
20,321 hours at 6 miles per hour	= 121,926 mi. switching miles at stations.

From this computation, it appears, therefore, that the number of switching miles at stations is 121,926. But these road switching miles, however, are not all per-

formed on the common tracks, as a great and presumably the greater part of the switching is done on exclusive freight tracks which have been allocated to that service and do not comprise any part of the common property. As there are no exact figures in the record to show the proportion of switching done on the common tracks as compared with that which is done on exclusive freight tracks, it is necessary to estimate that proportion; and I have made such estimate, basing it on the assumption that the same amount of switching is done per mile of common tracks used in switching operations at stations as is done per mile of exclusive freight tracks, an assumption which, although it may appear arbitrary, is a reasonable one and at least fair to the defendants, for the reason that the evidence shows that the greater part of this switching is necessarily done on exclusive freight property.

I have, therefore, on this assumption, computed the proportion of road switching done on the common tracks from the evidence in the case, by taking the total mileage of exclusive freight tracks at all stations on the road (except the five stations where the switching is done by yard engines) and the total mileage of common tracks used in switching operations at such stations, and find that such mileages are in proportion of 59.13% freight and 40.87% of the 121,926 road switching miles was done on common tracks, amounting to 49,811 road switching miles.

The switching miles made in the different yards of St. Ignace, Marquette, Ishpeming and Negaunee (one yard for both places) and Houghton, are shown by the testimony. There are no separate figures given for the switching in the Soo yard, as the switching there is done by one organization which does all the switching for three railroads. I have assumed that complainant has

the same amount of switching there as at St. Ignace, an assumption which is at least fair to the defendants, as complainant's volume of business at St. Ignace is greater.

I have computed, from the evidence, the proportion of the mileage of common tracks in each of said yards to the total mileage in said yards, and proceeding on the same assumption which I made for road switching, that the same amount of switching is done per mile of common tracks used in switching operations as is done per mile of exclusive tracks, I have divided the switching miles made in each of these yards on the track mileage proportion in such yard from which division it appears that of the 347,207 yard switching miles made in 1913, 111,475 miles were made on common tracks. I have divided these yard switching miles between passenger and freight on the proportions of 3.9% passenger and 96.1% freight, these proportions being agreed upon by the parties as representing the relative passenger and freight proportions of yard switching.

The following table, with the above explanation, shows how this modified train mileage ratio is arrived at, using the figures of the year 1913:

Freight revenue train miles (including ore)	865,096
Freight road switching, on common tracks	49,811
Freight proportion yard switching on common track	107,228
Total freight train miles	1,022,135

Per cent of total miles, 57.01.

Passenger revenue train miles	766,394
Passenger proportion yard switching on common tracks	4,247
Total passenger train miles	771,641

Per cent of total miles, 42.99.

The above method of computing switching miles made on common tracks is criticised by defendants on the ground that, at certain stations which they point out, too small an amount of common track has been assumed as being used in switching operations. To see if this criticism is of vital importance, I have caused a re-computation to be made , in which computation I have doubled the mileage of common track as theretofore taken by me at such enumerated stations, and I find that the result would be a change of little more than one-tenth of 1% in the final ratio. I therefore find that the error, if any, is so slight as to be negligble.

I have also worked out a modified train mileage ratio for each of the three other years, the accounts of which are in evidence. To do this, I have taken the freight revenue train miles and the passenger revenue train miles for such years and have added to each the relative switching miles made in each service in 1913 as above found. I have done this for the reason that the year 1913 is the only year for which the figures are in the record for making the computation of switching miles. While this method for the other years is not exact, the margin of error is slight and I believe that such ratios, as so found, are conservative and fair and sufficiently accurate for the purposes in hand. These ratios for the other three years are

1910.	Passenger	41.48%
1911.	Passenger	44.08%
1912.	Passenger	43.52%

I have adopted the average of the ratios of all the four years rather than the ratio of any one year, as representing more stably the use of the common property by the two services. This average ratio is passenger 43.02, which I find to be the proper ratio for the division of the common property, which has not been otherwise divided as hereinbefore explained.

(Note: This average ratio is hereinafter discarded and that of 1913 adopted instead for the reasons set forth in the discussion of Objection 10, infra.)

In the foregoing discussion, I have deemed it unnecessary to refer at all to any of the various other methods that have been from time to time put forward for the division of the common property. All such other methods may be regarded as eliminated from this case by the fact that both the parties accept the movement of revenue trains as the use of the common property that is to be measured in each service, and differ only as to the method of measuring that use, and the only question involved is that of choosing between the two methods proposed.

The foregoing use of the modified revenue train mile ratio suggested by the complainant for the division of certain property used commonly in the passenger and freight service is the subject of defendants' Objection No. 10. The objection has two subdivisions, "(a)" and "(b)", and I consider them in their order.

(a) This objection is that I failed to use for the division of common property the time basis suggested by the defendants in their modified revenue train mile ratio. I do not see any reason for changing my views on these two subjects as expressed in my tentative report.

(b) The general objection is that the modified revenue train mile ratio I have used attributes too great an amount, volume and value of property to the passenger business, and consequently too small an amount, volume and value of property to the freight business.

There are eight subdivisions, as follows:

(1) The allegation is that the modified revenue train mile ratio used by me does not give effect to the time, value or amount of use by the respective services. Insofar as this objection is intended to urge that a time ratio should be used, I have covered in it what I have already said.

Insofar as the objection states that my ratio fails to give effect to the value of the use by the respective services. I think it is in error. The purpose of the ratio is to measure the relative amount of use of common property in the respective services, and in my judgment, when the amount of use is determined, the value of the use is at once determinable. I am unable to see how the value of the use could be determined in any other way, unless the earnings made in the respective services should be used for that purpose, and this the decision in the Minnesota Rate Case forbids.

(2) The claim is that the percentage of the time of freight trains engaged in stational service used in the computation of my ratio is 32.2%, while the testimony shows that the correct percentage is 36%.

In this claim I find that the defendants are correct, although 32.2% is the percentage which they used in constructing their own modified revenue train mile ratio. I have corrected my ratio using 39.01%.

(3) The objection is that in the construction of my ratio, it was assumed that of the stational time, 15% is time during which no engines nor cars are moving on the common tracks. I am convinced that this assump-

tion was fully justified by the testimony, and is a moderate estimate. Nevertheless, I have concluded to modify my ratio by assuming that freight trains engaged in stational service are using the common property during all the stational time.

(4) and (5) In each instance the objection is that in the construction of the ratio, too great a mileage of exclusive freight track and too small a mileage of common track is used. There is also the further objection that there is error in the assumption that the volume of use per track mile is the same for both common and exclusive tracks.

There is no suggestion by defendants as to the extent to which they claim I have failed to include enough common track.

I find from the stenographer's report of their oral argument that they there insisted that the allowance of 528 feet for common track used for switching operations at small stations was too small. I have decided to recompute my ratio so as to double the allowance of common track at these stations.

The exclusive freight track mileage is a mere matter of computation from the evidence, as is the common trackage in yards. I find an error in the computations due to the fact that I included in the list of exclusive freight tracks, certain spur tracks on which the complainant's engines performed no switching movements in 1913, viz., the "Michigamme Mine," "Danaher," "Northern Cooperage," and "Danber" branches.

This change by doubling the allowance of common track at certain stations and deducting those freight tracks, results in a change in the proportion of common and exclusive tracks used in road switching from 40.87% common to 49.7%.

The methods of operating the complainant's railroad

have been very fully shown in the testimony. The location of industrial tracks of all kinds, their length and the manner in which they are used is in the evidence, and the only conclusion I can draw from all this evidence is that my finding of an equal volume of use per mile of the common and exclusive tracks is one in which, if there is error, it is against the interest of the complainant and not against the defendants.

(6). This objection is that in the adoption of my modified revenue train mile ratio, the applicable presumptions of law are reversed and the doubts in favor of the validity of the statute and the rate are resolved against the sufficiency of the rate. Here as elsewhere, I resolved all doubts in favor of the defendants, and I think I have made no unwarranted presumptions. Nevertheless, I have, in view of objections made by defendants, now gone further, and have modified this ratio in two additional particulars favorable to defendants, as hereinbefore explained.

(7) This objection is to my division of property between passenger and freight, and it states that that division, as made, is dependent solely on opinion without adequate supporting data.

This statement must refer either to the principle of dividing on the train mile basis or to my application of that principle, and in either case it is erroneous.

If it refers to the principle of division, it is erroneous, because my finding that the revenue train mile is the proper basis for such division is not based upon opinion evidence, but upon the grounds set forth at length in my previous discussion of that subject.

If it refers to my application of the principle, it is also erroneous, for the ratio I have used is certainly not based solely on opinion evidence. The revenue train mileage in the respective services was shown from actual

records kept by the complainant. A great part of the switching mileage was also shown by such actual records and the remainder of the same could be determined by mathematical calculation from proved facts. So far as the time spent by freight trains at stations was concerned, the testimony showed, and it was undisputed, that such trains were detained at stations for long but varying periods, engaged in switching operations, and the only opinion evidence on that subject was given by employees working on such freight trains as to the extent of the stay of the various classes of freight trains at these intermediate stations. Some gave their judgment from their general knowledge, based on experience, and others on such general knowledge supplemented by actual test observations.

I can, therefore, see no ground for this objection.

(8) The objection here appears to be a repetition in general form of the specific objections hereinbefore considered, and as such it calls for no further discussion.

The result of the changes above determined upon is to make the modified train mileage ratio for the year 1913 41.91% instead of 42.99%.

The corresponding ratios for the other years are: 1910, 40.45; 1911, 42.94; 1912, 42.36; average for the four years, 41.91.

Division of Passenger Property in Michigan Between Intrastate and Interstate.

Having made this division of the common property, I have the entire property of the complainant divided between the passenger and freight departments. It now becomes necessary to divide the passenger property between the intra- and interstate business.

It is agreed between the parties that this division may be made in the proportion which the interstate and intra-

state passenger miles, respectively, bear to the total passenger miles. Using the mileage for the year 1913, the proportion is 65.58% intrastate and 34.42% interstate. Before applying these percentages, I have deducted the passenger proportion of the value of the so-called Soo bridge and assigned it entirely to the interstate business.

Attached hereto marked "Exhibit 1" is a summary of the property values I find with the division of the same between the passenger and freight services, and of the passenger proportion between intrastate and interstate passenger business.

Estimated Return to be Expected on Complainant's Passenger Property Under the Two-Cent Rate.

I have now completed the valuation called for by the first of the three main questions in the case, viz: what is the value of the property employed in the complainant's Michigan intrastate passenger business? — and have thereby found both the total value of the complainant's property in railway use in Michigan in the year 1913 and also the value of the portion thereof then employed in the complainant's Michigan intrastate passenger service.

I now pass to the second of the three main questions, viz: what annual return on this valuation of the passenger property is to be expected under the prescribed rate? —that is to say, what would be the probable net earnings in each year of the complainant's passenger business if the two-cent rate were enforced.

This question calls for a forecast of the future, and as the only means of judging the future is by the experience of the past, we must find, in results of past experience, a reasonable basis for estimating the future. And as there has been no experience on the part of the complainant

under the two-cent rate, the only means of estimating the results of complainant's passenger business to be expected in a future year of operation under the two-cent rate it to take, as a basis of such estimate, the results of their experience in a certain year under the three-cent rate. And as the use of such results as a basis of estimate involves the assumption that those results would be approximately duplicated in the future years, except as they would be affected by the reduction in rates, the results so used should be those of such a year as would be most likely to be so duplicated. The first step, therefore, is to determine the particular year that is to be taken as furnishing such results. Such a year has been characterized by counsel as a "normal year", meaning thereby a year in which neither earnings nor expenses were so much out of the ordinary as to be abnormal. The complainant, in its bill, alleges that the year 1910 was a normal year, but that is neither binding on them nor accepted by defendants. As furnishing the data required for such a basis of estimate, the complainant has given in evidence in full detail the results of the company's operations not only for the year 1910, but also for each of the three years next succeeding,—showing its revenues and expenses and its net income both from its Michigan business and from the business of its entire system. It is upon the data thus furnished that the complainant undertakes to base its estimate of future business under the prescribed rate; and it is from these data that the question of what will constitute a normal or typical year is to be determined. With regard to this question, my judgment is that it is not the business of any particular year, either fiscal or calendar, that will furnish the most reliable basis for estimating future business, but an average of several years, neither of

which is very considerably out of the ordinary, either as regards earnings or expenses.

As regards the income of such typical year, the complainant proposes to take the average of the four years above mentioned, 1910, 1911, 1912, 1913—according to which the gross passenger income for the typical year would be $949,102.56.

To this the defendants object, and claim that the earnings of the year 1913, which amount to $962,324.98, should be used instead of the average of the four years. The difference between these amounts is not great or of vital importance in the case, but it involves an important principle and therefore requires to be considered carefully.

The question raised is that of a choice between assumptions. For the purposes in hand we are obliged to assume that the earnings in any one future year under the old rate will probably be a certain amount, and the question is whether it is more logical and probable that they will be the amount of 1913, or the average amount of that year with the three previous years.

As between these two assumptions, the latter is the more logical. To make the former assumption, it is necessary to assume that the annual earnings will not fluctuate but will either remain the same as in 1913, or exceed that amount. Such an assumption finds no support in past experience. On the contrary, the earnings have in the past always fluctuated, and as we are using past experience as a basis of future expectations, we are bound to presume that the earnings will, in the future, continue to fluctuate instead of remaining the same or invariably increasing.

Assuming, then, that future earnings will fluctuate as past earnings have fluctuated, we must assume also that the average of these fluctuations in future years will be

substantially the same as that average has been in past years.

For these reasons, I have taken as the amount of annual passenger earnings in future years to be the average above mentioned, viz, $949,102.56.

As regards the amount to be taken as the expenses of the typical year, the complainant proposes to take the average of the four years mentioned as shown by the accounts of the company, but with certain modifications, and certain changes in the accounts as kept by the company, necessary to be made in order to show the true expenses. The proposed modifications and changes it is claimed are necessary because if the accounts of expenses for any year are to be used as a basis for judging future expenses, certain facts which are not shown in those accounts as kept must appear or be made to appear, which facts are as follows:

1. The amount of proper depreciation in such year.

2. That the prices paid for material in such year were substantially those which are to be anticipated in the future.

3. That the prices paid for labor in such year were substantially those which are to be anticipated in the future.

4. That the expenses of maintenance of all kinds for such year were substantially those which are to be anticipated in the future—that is, the maintenance expenses must represent only maintenance required in the year under consideration and must not include deferred maintenance which properly should be spread over a period of years.

Under these four heads, respectively, the complainant claims specifically:

1. That proper depreciation on bridges, trestles and

culverts, and all structures of every kind, must be charged in each year before the expenses of that year or the average of the four years can be adopted as a guide.

2. That the scale of wages in 1913 is shown by the evidence as being more likely to prevail in the future than the average scale of wages in 1910, 1911 or 1912.

3. That in general the prices of all material had increased in 1913 and are still increasing, and in particular that the increasing cost of ties is so definitely shown in the evidence that the 1913 price should be adopted rather than that of either of the three other years.

To this proposal for determining the expenses of a typical year, the defendants make numerous objections.

First. As regards depreciation, they claim that no allowance or charge should be made for depreciation in any of the four years, because, as they claim, the depreciation which would naturally occur in that year was overcome by repairs made out of maintenance expenses in that year; or, at all events, that there is nothing in the testimony that shows what, if any, depreciation took place in either year that was not overcome by the maintenance repairs of that year. This objection, if well grounded, presents a serious difficulty.

There can be no question that any depreciation in the property used, not overcome by maintenance, is a proper part of the expense of rendering the service; that in the case of a bridge or other structure, such depreciation is constantly going on to such an extent that in the course of time the structure must be discarded and replaced by a new one.

This constantly accruing depreciation amounts, of course, in the end to the entire value of the structure new; but the amount of depreciation that will have accrued in any particular year cannot be determined; it can only be

estimated by determining the probable period of life of the structure, and spreading the depreciation uniformly over the period on the assumption that the depreciation was at a uniform rate throughout the period. But the amount of this uncared for depreciation actually accruing in any particular year will depend more or less upon the amount of repairs made in that year, so that the uniform depreciation charge may or may not in any particular year correspond to the fact.

The objection here made assumes that depreciation cannot be charged in any year unless it is affirmatively shown that the value of the structure under valuation was actually worth that amount less at the end of the year than it was at the beginning or at least shown that no part of the depreciation for that year or for any previous year was overcome by the maintenance charged for in that year. If this assumption is warranted, I am unable to see how any such depreciation charge can be made in this or in any case because I am unable to see how it would be possible to make such an affirmative showing. It is not possible to thus definitely determine the actual depreciation of any one year and divide it into two parts, one of which is overcome by the maintenance charged for that year, and the other of which is not so overcome; or to determine whether in that year any depreciation suffered in previous years was overcome by the maintenance charged for that year.

If, therefore, the defendants' assumption that such proof is required is warranted, the depreciation in question cannot be allowed. The question is not free from difficulty; but I think the assumption is not warranted—that there is no such interdependence between depreciation and maintenance as is here involved. The deprciation here considered is that inevitable progressive depreciation in the course of which the entire value of the

structure is gradually expended. The life of the structure may be prolonged by repairs and its length may depend to some extent on the amount expended in repairs, but eventually the entire value must be lost; and the amount so lost by depreciation must be spread over the period of life; and the only practicable way of distributing the loss as between the years is by assuming the depreciation to have been uniform and assigning an equal portion to each year.

The amount thus assigned to any one year may be more or it may be less than the actual depreciation of that year; and to this extent the assignment is arbitrary; and is open to the objection made by defendants that under it certain portions of depreciation may in any year be charged for twice—once as depreciation and once as maintenance. This possibility there seems to be no way of guarding against.

It results, therefore, that we are compelled to choose between disallowing depreciation entirely or allowing it notwithstanding this possibility of duplication.

As between those two alternatives, it seems to me that the latter should be preferred for two reasons: first, because it is less likely to work injustice, and second, because it is not the expenses of any particular year that is taken but the average of several years.

It would be less likely to work injustice because the ultimate loss by depreciation is an inescapable fact and an entire disallowance of depreciation is therefore certain to work injustice to the extent of the loss disallowed.

On the other hand, the danger of injustice from the possible duplication of depreciation charges is minimized by taking the average maintenance expenses of several years instead of those of any single year. The chief purpose of taking such average is to counteract the abnormalities that there may be in any particular year. In my

computations I have, however, made no allowance on account of depreciation as an expense charge, for the reason that complainant has not furnished testimony from which I am able to determine with sufficient definiteness a proper amount for such item.

2. Scale of Wages for Typical Year.

To the complainant's proposal to take for the typical year the scale of wages of 1913 instead of the average scale of the four years, the defendants make several objections; one of which is, in effect, that it would involve an abandonment of the four years' average as furnishing the typical year—that if the four years' average is to be taken for any purpose it must be taken for all purposes.

This objection, I think, is well taken. I do not see how we can with any consistency take for the typical year the average experience of four years in respect to some items and the experience of one of the years in respect to other items.

It is true, as complainant claims, that judging from past experience generally, the probabilities are that wages will be more likely to go up than down, but the basis on which we are here undertaking to forecast the future is a definite particular experience, and not an indefinite, general experience; and we cannot shift from one basis to another.

3. Prices of Material for Typical Year.

As regards prices of material, the complainant claims generally that the prices of all material had increased in 1913 and are still increasing; but they make no specific claim in this regard except the claim that the increasing cost of ties is so definitely shown in the evidence that the 1913 price should be adopted for the typical year.

The objection made and allowed to the preceding item

applies equally to this. Both this and the preceding items involve a misconception of the precise nature and function of the typical year in that they assume it to be an estimate made and grounded in opinion, whereas it is the basis of an estimate to be made and is grounded in fact—the facts of the complainant's actual experience. The first claim of complainant in this connection, viz: that relative to depreciation in the typical year, was allowed because the depreciation was a fact, and as such to be taken into account, and this notwithstanding that it had not been charged up on complainant's books, but the two subsequent claims are of entirely different nature. The facts there alleged are, if true, proper to be given consideration in connection with the general question as to what is to be expected in the future in view of past experience, not only in general, but also and especially in view of the particular experience of the typical year.

As bearing on the general question as to what is to be expected in the future, complainant asks me to find, and I do find, from the evidence that since 1910 there has been a substantial increase in the rate of wages paid by complainant in almost all classes of labor employed by it; that a large proportion of this increase came from a raise in wages for trainmen, and that this increase is probably permanent.

Complainant also asks me to find in this connection, and I do find, from the evidence, that since 1910 there has been a steady increase in the prices of railway supplies generally and particularly in the prices of ties.

Complainant further asks me to find, in this connection, and I do find, that it is the rule of law that a public service corporation must be allowed sufficient revenue to pay its operating expenses, to keep *up its property* and to pay a fair return on the investment; that in accordance with this rule, such a corporation is entitled to and should

charge off each year, in addition to its operating expenses, a sufficient sum to take care of the annual depreciation of its property; that the testimony shows that complainant has not, in its accounts, charged depreciation on any of its property except equipment and ore docks; and that to represent a true statement of the financial results of complainant's operations, there should be added to the operating expenses of each year, as shown by the company's books, an additional amount to take care of the depreciation on the remainder of the property on which no depreciation has been charged.

Complainant further asks me to find, in this connection, that it appears from the testimony that if the scale of wages paid in 1913 had been in effect in the preceding three years, if the tie prices paid in 1913 had been in effect in the three preceding years and if in each of the four years a proper charge had been made for annual depreciation on the bridges, trestles and culverts on complainant's road in Michigan, to say nothing of depreciation on buildings and other property, which depreciation I have not attempted to compute, the average Michigan operating expenses of those years would have been increased by $70,159; the average Michigan passenger operating expenses would have been increased by $21,769; and the average Michigan intrastate passenger expenses would have been increased and therefore the average Michigan intrastate passenger net income reduced by $13,346. The statements and computations contained in this request, I regard as matters of argument and as not calling for a specific finding by the Master.

Defendants further claim that in the years 1912 and 1913, the operating expenses of complainant contain charges for expenses which were occasioned in part on account of the rebuilding of bridges, and the substitution for the old structures of better and more permanent

structures, and a general ballasting of large parts of the road in Michigan, the necessity for which was to take care of maintenance which had been deferred in previous years. With reference to the new bridges, if I correctly understand their contention, it is that the accounts were so kept that there were charges made to expenses which should have been included in the account for additions and betterments, with the result that the value of complainant's property was increased out of operating expenses. I cannot find from the evidence that there is any foundation for these claims with reference to the year 1912.

It does appear, however, that the expenses on account of the maintenance of way and structures for the year 1913 were considerably in excess of the expenses on the same account in any of the other three years. Thus, with reference to the item "Bridges, Trestles and Culverts", the expenses in 1913 were $28,645 greater than the average for the three preceding years, and the "Roadway and Track" expenses were $38,909 in excess of the average of these expenses for the three preceding years.

The testimony shows that the accounts of these expenses were kept by complainant in accordance with the rules of accounting prescribed by the Interstate Commerce Commission. Nevertheless, it is my judgment that under those rules, if "the cost of replacing in kind, bridges, trestles or culverts removed or abandoned" were charged to operating expenses at the cost new of such replacement in kind, instead of at their present value, it might result in too much being charged to operating expenses and too little to "Additions and Betterments."

It is also true that there was a reballasting of considerable portions of complainant's line in Michigan during the year 1913, and I cannot escape the conclusion that some of the expense was to take care of deferred mainte-

nance. I conclude therefore that defendants are right in their contention that the expenses for the year 1913 do not represent the expenses of a normal year.

All of these assumed abnormal expenses, the evidence shows, are necessarily reflected in four of the subsidiary accounts under the general account "Maintenance of Way and Structures", to-wit: "Superintendence", "Roadway and Track", "Bridges, Trestles and Culverts", and "Ballast". With reference to the accounts "Superintendence", "Roadway and Track" and "Bridges, Trestles and Culverts", I have assumed that the average of the three preceding years represents a normal year. With reference to "Ballast", I have assumed that the average of the five years, 1908 to 1912, represents a normal year's expenses on this account; and the excess charges on complainant's expenses for the year 1913 beyond these amounts, I have rejected. The amount of these deductions, and also the amounts thereof applicable to the freight and passenger service, respectively, and to the inter and intra service in each department, respectively, are shown as follows:

	Passenger	Freight	Total
Superintendence	$ 4,863	$ 7,782	$12,645
Ballast	9,199	12,750	21,949
Roadway and Track	16,307	22,602	38,909
Bridges, Trestles & Culverts	12,005	16,640	28,645

	Intra.	Inter.
Freight	$16,665	$43,109
Passenger	27,789	14,585

Necessarily, the effect of these adjustments of expenses is to increase the net revenues of the complainant by the amount deducted.

$12,000 Paid to President Fitch on His Retirement.

In the statement of complainant's operations for the year 1913, being complainant's Exhibit 67, Sheet 16, under the heading "Other Deductions", is an item of $12,000 paid to William F. Fitch, who had been the president and general manager of the company for many years, and who retired from the presidency in December, 1911. The evidence as to the precise purpose and reason for this payment is not very clear; but it seems to have been in the nature of a substitute for what would have been allowable to him under a system of pensioning old employes, if the company had had such a system. It belongs to a class of allowances which are frequently made by railroads and other corporations as part of their general expenses, and which it is clearly within the discretion of the corporate directors to make; but whether it is an expenditure which is proper to be charged up in this case is not so clear. It does not appear from the evidence that it or any part of it was a necessary expenditure in the carrying on of the business to which the prescribed rate applies, and in any event it should not all be charged up as part of the expenses of the year 1913, or of any one year. If allowed here at all, it should be spread over a period of years and there is nothing in the evidence from which to determine what that period should be. As the item is in itself somewhat doubtful and is clearly not chargeable in its entirety to the year 1913, I am unable to see how I can allow the item or any specific part of it and have decided to sustain the defendant's objection to it, and to exclude it from my computation.

After making these adjustments of the 1913 expenses and deductions from income, I have taken as the operating expenses and deductions from income of my typical year the average of the passenger operating expenses and deductions from income of the four years, 1910 to

1913, inclusive, for the same reasons which I have given for taking the average of the revenues of said four years to make up the revenues of my typical year.

To these conclusions thus reached by me, counsel for both parties renewed the objections hereinbefore discussed (pages 268-282) and in addition, defendants made new objections, No. 11 and 12, as follows:

> No. 11. "The defendants reserve the right to present an exception that such report is erroneous in its finding and determination that the gross passenger income for the four years 1910-1913, is to be taken and used for testing the validity of the statute, instead of the gross passenger income for 1913."
>
> No. 12. "Exception is made and objection taken to the failure to find and use the average value of the complainant's property in use in its railroad business for the four years (1910-1913) for which the income and expenses are averaged and used."

The Master says (p. 226):

> "If the four year average is to be taken for any purpose, it must be taken for all purposes."

In considering the defendant's objections, my first impression was that these two objections were to be considered together and that when so considered they were to the effect that the average of earnings and expenses for the four years 1910 to 1913 could not be taken as those of the typical year to be used here without taking also the average value of the property employed in those years and this latter could not be taken because we have not found the average value of the property employed in those years, but have found the value of property employed in the year 1913 only, and that therefore it is the earnings and expenses and value of property employed in that year that must be taken as constituting the typical

year. And this understanding of the objections seems to be fully confirmed by the fact that in support of the objections defendants' counsel quoted the finding previously made by me herein that "If the four year average is to be taken for any purpose, it must be taken for all purposes."

With this understanding of them, I found that the objections were well taken for the reason that it is not merely future earnings and expenses that are to be forecast, but also the relation of those earnings and expenses to the value of the property empolyed; and in forecasting this relation we cannot take the earnings and expenses in a certain past year arising from the use of one amount of property as a measure of what earnings and expenses will arise in any future year from the use of a larger or smaller amount of poperty. As it is clear that if any average of earnings and expenses (or of either of them) is to be taken, it must be accompanied by the average value of property employed in the several years entering into that average, and as we have here found only the value of property employed in 1913, the objections seemed to me to require that the year 1913 be taken as the typical year, and as I did not deem it an actual necessity to take any average year, and as both parties appeared willing to take the year 1913 as the typical year provided its expenses were normalized, I sustained these objections, adopted 1913, with expenses normalized, as the typical year, and made all subsequent estimates and calculations accordingly.

Afterwards, defendants' counsel, having been advised by me of my understanding and treatment of these objections, informed me that such was not intended by him to be the effect of the objections, and explained that his intention therein was to object not to the use of the average of expenses for the four years but only to the use of the

average of gross earnings; and that the effect intended to be accomplished by the objections was to require that the typical year be made up by taking the average expenses of the four years and combining them with the earnings and property of the year 1913. It appears, therefore, from this explanation, that the purpose of these objections was, not as supposed by me, to require that the results of 1913 be taken as those of the typical year, but that the earnings and property only of 1913 be so taken, and that for the purposes of a typical year, these latter should be combined with the average expenses of the four years, those of 1913 being first normalized for that purpose.

Insofar as these objections seek to accomplish this purpose, I am unable to see how they can possibly be sustained. It would be in direct conflict with the principle above referred to that if an average year is used for any purpose it must be used for all purposes. That principle has been adopted and strictly adhered to in this report, and has been repeatedly recognized and appealed to by counsel on each side; and it is a principle about which there can be no question. In fact, it is this very principle that is invoked by defendants' counsel in these two objections—the objections being directed against the average year which I had adopted and being made upon the ground that the average of earnings and expenses of the four years cannot be taken without taking also the average of property employed in the same years, which is, of course, a practical application of the principle that if an average is taken for any purpose, it must be taken for all purposes.

I am therefore virtually asked first to sustain these objections on the ground that I erred in finding a typical year by taking an average of earnings and expenses for a number of years and combining them with the property

of a particular year, and, second, having thus corrected this error, to proceed to commit the same error by taking for the typical year an average of expenses for a number of years and combining them with the earnings and property of a particular year and thus involving a glaring inconsistency.

But, aside from this inconsistency, it is perfectly clear that we cannot take separately for the typical year either the earnings, expenses, or property of one year and combine them or it with either the earnings, expenses or property of another year. And it is therefore clear that these objections insofar as they claim that average earnings and expenses of a number of years cannot for the purpose of finding a typical year, be combined with property employed in a single year, must be sustained for the reason already stated, and that for precisely the same reason, it is equally clear that tht objections insofar as they claim that the typical year should be made up by combining the earnings and property of 1913 with the average expenses of the four years must be overruled.

These objections having been thus disposed of, it remains to conider how the typical year already adopted is thereby affected. As already stated, the year 1913, with expenses normalized, was taken by me as the typical year and all estimates and calculations made accordingly, on the understanding that the defendants desired it and the complainants were satisfied with it. It now appears that the defendants do not desire it, but desire instead the composite year combining average expenses of the four years with earnings and property of 1913, so that it comes to a question of choice between such composite year and the year 1913. As between those two, there can be no hesitation in choosing—the one is impossible, while the other is practically unobjectionable, and is, I think, the best that is here available. True, as a general princi-

ple, the average results of a number of years afford a safer criterion by which to forecast future results than do those of any particular year, but they do not always do so, and in this case, their superiority to those of 1913, if anything, would be too slight to be of any consequence. It would be possible, in this case, to use an average of three years as we have the earnings and expenses of 1911, 1912, and 1913, also the property value of 1913, and could probably find from the testimony the property values for 1911 and 1912; but those property values have not been found by me, and in view of the results of those years as found, I can see no good reason for finding and adopting as those of the typical year the average results of those three years, in preference to those of 1913, with expenses normalized.

My conclusion, therefore, upon the questions involved in those objections is that the average results of four years formerly adopted by me as the typical year was erroneous for the reason stated; and that the results of the year 1913, with the expense normalized, are to be taken and used instead as those of the typical year for the reason that under the circumstances they may, without injustice to either party be taken as those most fairly typical of the results that are to be expected in future years.

Results of Complainant's Past Operations in Michigan, 1910—1913.

Complainant has offered in evidence in great detail the results of its operations for each of the four fiscal years, 1910 to 1913, inclusive, showing its revenues and expenses, and its net income, both from its entire system and from its Michigan business.

Except as to a few comparatively small items, there is

no dispute as to the correctness of the figures, but there are substantial differences between the parties as to the proper division of revenues and expenses between the freight and passenger departments, and between intrastate and interstate freight and passenger.

Attached hereto, marked Exhibits 2, 3, 4 and 5, is a statement of the results of complainant's Michigan passenger operations during each of the four years named as I have found them.

The methods used by me in making the various divisions of revenues and expenses and my reasons therefor will be explained.

But before entering upon such explanation, it is desirable to dispose of certain questions raised by the defendants in relation to complainant's revenues and expenses, as follows:

(1)—Sleeping and Dining Cars.

The defendants claim that these two services are "Outside operations", meaning by "outside operations", operations outside of the passenger business to which the prescribed rate applies—and that therefore the operating expenses of these facilities must be excluded from complainant's passenger expenses before the true passenger expenses can be determined.

This claim of the defendants applies equally to both the sleeping cars and the dining cars, but the two kinds of cars involve different considerations, and they will therefore be considered separately.

Sleeping Cars.

With regard to the sleeping cars, the complainant claims that their earnings and expenses should be included as part of the service to which the prescribed rate applies, but would be willing to consent that they be

treated as outside operations and their earnings and expenses properly chargeable to that service be excluded, if it is also understood that the railway fares received from passengers carried in sleeping cars are part of the earnings of the sleeping cars and as such are excluded from consideration as passenger earnings; but it denies that it is possible to ascertain those earnings and expenses, either from the testimony or from their records.

But this concession would not satisfy the defendants. They claim that the sleeping cars and the fares received for berths and seats should be excluded from the passenger revenues, but that the fares received in them for railway transportation should be included as part of the return on the property required for the transportation of passengers, because of the alleged fact that the passengers paying those fares could have found ample accommodation in the day coaches of the train on which they were riding; that the company were under no obligation to carry these passengers in sleeping cars, but so carried them voluntarily and of their own motion; that they thus unnecessarily supplied double accommodations for these passengers, and that the public cannot be required to pay for both accommodations but only for that which was provided in the day coaches; that these passengers would have used and paid for accommodations in the day coaches if the company had not provided those in the sleeper, and that the company cannot thus deprive the public of the right to be credited with these fares by voluntarily providing other accommodations outside and inducing passengers to use them.

The position thus taken by defendants assumes that the Legislature in legislating with reference to sleeping cars has treated the operation of such cars as an operation outside of and not a component part of the business of transporting to which the prescribed rates applies;

also, that in enacting the statute in question, the Legislature intended to deal with and prescribe for the business of transporting passengers in day coaches only and treated it as a business wholly separate and distinct from the business of transporting passengers in sleeping cars. Is such assumption warranted?

Assuming that it would be competent (as it undoubtedly is) for the Legislature to so fix the status of the sleeping car service and also that of the transportation service in day coaches that the former service will be an operation outside of the transportation service to which the prescribed rate applies, is it a fact that the Legislature has done so? Does it appear from the statutes on the two subjects that such was the intention of the Legislature?

These statutes are two in number, i. e., that of 1875, authorizing the operation of sleeping cars and the sale of berths and seats therein, and that of 1911, prescribing the rate in question. The statute of 1875 is as follows, being Sections 5252-3 of the Compiled Laws of 1897:

> Section 1. The People of the State of Michigan enact: It shall be lawful for any railroad company operating any railroad within this state, to construct or use for the transportation of passengers, sleeping cars, parlor cars, or chair cars for the use of such passengers as may desire to use the same, and such company may make such reasonable rules and regulations concerning the use of these as such company may think proper, and may charge a reasonable compensation for such use, in addition to the regular passenger fares allowed by law.
>
> Section 2. Nothing herein contained shall release any such railroad company from its obligations to furnish first-class passenger cars for the use of the

public for the regular passenger fares now fixed by law.

In this statute I am unable to discover any intention to make the operation of sleeping cars an operation distinct from and outside of the business of transporting passengers. On the contrary, it seems to me that the statute clearly evinces an intention to make the operation of sleeping cars a component part of the buiness of transporting passengers—that the permission there given was not a permission to institute and carry on an outside operation for the purpose merely of furnishing sleeping facilities, but was rather a permission to operate sleeping cars in connection with, and as a part of, their passenger trains for the purpose of transporting therein such passengers as might desire to avail themselves of and pay extra for the special accommodations thus furnished in connection with their transportation. The railroads might lawfully have installed and operated such cars without such legislative permission, but probably could not lawfully have refused to permit a passenger to ride in them without the payment of a sum in addition to the regular railway fare then prescribed. To authorize the railroads to require such extra payment as a condition of riding in these cars seems to have been the chief moving cause of this statute. But be that as it may, the statute treats the operation of sleeping cars as a part of the business of transporting passengers, and evinces no intention to regard it as an operation outside of that business.

Turning now to Act 276 of the Public Acts of 1911, the Act complained of in this case, I am in like manner unable to find therein any evidence of an intention on the part of the Legislature to make the sleeping car service an operation outside of the passenger service to which the prescribed rate applies, but find, on the contrary, what seems to me an evident intention to treat the sleep-

ing car service as a component part of the business of transporting passengers.

The statute, or the particular portion of it that concerns us here, is as follows:

"Every such corporation shall possess the general powers and be subject to the liabilities and restrictions following; that is to say: * * *

Ninth: To regulate the time and manner in which passengers and property shall be transported and the tolls and compensation to be paid therefor; but such compensation for transporting any passenger and his or her ordinary baggage, not exceeding in weight 150 pounds, shall not exceed the following prices, viz: for a distance not exceeding five miles, three cents per mile; for all other distances for all companies the gross earnings of whose passenger trains as reported to the Commissioner of Railroads for the year 1906 equaled or exceeded the sum of $1,200 per mile for each mile of road operated by said company, on which regular passenger service is maintained, as hereinafter provided, two cents per mile, and for all companies whose earnings reported as aforesaid were less than $1,200 per mile of road operated by said company, three cents per mile: Provided that in the future, whenever the earnings of any company doing business in this state as reported to the Railroad Commission at the close of any year shall increase so as to equal or exceed the sum of $1,200 per mile of road operated by said company, then in such case said company shall thereafter, upon the notification of the Railroad Commission, be required to only receive as compensation for the transportation of any passenger and his or her ordinary baggage, not exceeding in weight 150 pounds, a rate of only two cents per mile as here-

inbefore provided: * * * Provided further that no company shall charge, demand or receive any greater compensation per mile for transportation of children of the age of twelve years or under than one-half the rate herein prescribed. * * *"

Now, if it had been the intention of the Legisalture in enacting this statute to deal separately and specifically with the business of transporting passengers in day coaches in the ordinary manner, the provisions of the statute would, of course, have been made applicable in terms to that particular business, separately and specifically. Instead of being so made applicable, the provisions are made to apply to the entire business of transporting passengers both in day coaches and in sleeping and chair cars, without distinguishing in any way between the businesses carried on in the different classes or kinds of cars. In either kind of car the transportation charge is to be the same.

Not only so—not only is the entire transportation of passengers treated as one business, but the entire passenger train service also is so treated, even to the extent of making it the basis on which the applicability of the new rate is predicated. In prescribing the conditions under which the new rate shall or shall not be applied, it is the amount of earnings that is made the determining factor and the earnings on which that determination is predicated are not merely the earnings of the day coaches in the passenger trains, but the earnings of the entire train, including the sleeping cars. For the purposes of this case, we are required to presume that the legislature in perscribing the rate and the conditions under which it was to be applied, investigated and determined the conditions under which the rate to be prescribed would yield a fair return on the value of the property employed in producing it, and having deter-

mined those conditions, prescribed them in the statutes. The judgment which we presume that the legislature thus formed is found in the statutes and it is this, that when the gross passenger train earnings amounted to as much as $1,200 per mile of road operated, the two-cent rate will yield a fair return on the value of the property employed. Now does this mean the property employed in earning the $1,200 per mile of road operated, or in earning the two-cent per mile of each passenger carried? Or does it, or can it mean both? It must manifestly mean the former, whether it means also the latter or not. The fact of earning the $1,200 is made the ground for reducing the passenger rate and it certainly could not be made such ground if it did not yield a fair return on all the property employed in earning it. So that if it means also, what is claimed by defendants in effect, that the two-cent rate will yield a fair return on the specific property employed in earning it, and that that property consists entirely of day coaches and a part of the baggage car and the properties assignable thereto, it must be by inference drawn from the former. But no such inference is possible. The fact that $1,200 per mile can be earned by the use of the entire property of the train furnished no ground for any inference as to what return the passenger earnings will pay on that part of the property in the train that is devoted to the transportation of passengers, and there is no indication that the legislature undertook to draw such inference.

The only judgment which the legislature can be found to have pronounced is that when the passenger train earnings reached $1,200 per mile, the passenger earnings under a two-cent rate, together with the other earnings of the train, will yield a fair return on the entire property assignable to the passenger train service. In this judgment the legislature does not undertake to distin-

guish between the passenger transportation service in the day coaches and that in the sleeping cars, but deals with the passenger service in its entirety.

I therefore find that the entire business of transporting passengers, whether in sleeping or other cars, is one business, and that in no proper sense can the sleeping car business be considered an "outside operation".

But from this conclusion, it does not follow that the complainant, under this permissive statute, may transport passengers in sleeping cars in such a manner as to burden its other business with expenses which would not be incurred if passengers were not so transported, and then have these burdensome expenses treated as part of the necessary expenses of its passenger business in determining whether the rate of return allowed under the act herein in controversy allows a fair return upon the property employed in passenger transportation.

The parties to the litigation are in accord on the proposition that the transportation of passengers in sleeping cars must not thus burden the other passenger business. But they are in sharp disagreement as to whether the transportation in sleepers does burden the other business, and as to how the question of whether there is such burden or not shall be determined, and if there is such burden, as to the amount thereof.

The following table shows for the years 1910 to 1913, inclusive, the gross revenue received from the sale of berths and seats, the expenses and the net revenue:

1910	$ 25,803.21	$14,060.06	$11,743.15
1911	26,262.23	14,548.14	11,714.09
1912	26,685.83	17,506.87	9,178.96
1913	30,243.11	17,911.30	12,331.81
	$108,994.38	$64,026.37	$44,968.01
Average	$ 27,248.59	$16,006.59	$11,242.00

In these expenses are included all the expenses directly incurred in operating these cars, such as the salaries and expenses of superintendents who look after the service, the wages of sleeping car conductors and porters, the cost of maintenance depreciation and insurance of the cars, and stationery and printing, but they do not include any of the expenses incident to the transportation of the cars as a part of a train, or incident to the maintenance of the other general passenger property of the company. The value of the sleeping cars assigned to Michigan, owned by the company, I have found to be $65,566.00.

The revenue received by the complainant for the transportation of passengers in the sleeping cars cannot be determined with certainty, for the reason that they have never been separated from the other passenger transportation earnings in the accounts of the complainant.

The complainant contends, however, that the court may take judicial cognizance of the fact that such earnings would be at least three times the amount received from the sale of seats and berths, which would make the average receipts for the transportation of passengers in those cars over $80,000 per year. If it were necessary, I think I would be justified in so deciding.

It is the claim of the complainant that if these earnings are in excess of the extra cost involved in hauling the sleeping cars, then the sleeping car business of the company, that is, the business of transporting passengers in sleeping cars and furnishing them sleeping berths or seats, is carried on at a profit and the other passenger transportation business of the complainant is not burdened, but, on the contrary, helped. By "extra cost" the complainant means any operating expenses other than those of "outside operations" which the complainant could escape if it carried on its passenger transporta-

tion business only in day coaches, and used no sleeping cars.

The defendants, through their witness, Mr. Thompson, an expert accountant, introduced evidence from which the expenses assignable to the operation of the different classes of cars used by the complainant in its passenger train service can, for the years 1912 and 1913, be fairly approximated by the use of formulas prepared by Mr. Thompson, which take into consideration the weight of the different cars and the miles run by them. I shall later more fully explain these several formulas. For my present purpose it suffices to say that by Mr. Thompson's method, it is possible to estimate for the sleeping cars, the extra expense above referred to for each of the years named. In the year 1912, this extra expense was $39,346 and for 1913 $38,968. In estimating this extra expense, there is excluded all of the 60% of the maintenance of way expenses, which are admittedly entirely attributable to deterioration on account of the elements, as hereinbefore explained. Of transportation expenses, there are excluded all of the expenses of superintendence and of dispatching trains; the wages of road enginemen; the expenses of interlockers; engine house expenses, road; the wages of road trainmen; crossing flagmen and gatemen; telephone and telegraph operation; damage to property; damage to live stock; injuries to persons; other expenses; stationary and printing; also there is excluded that portion of fuel, water, lubricants and other supplies for road locomotives which Mr. Thompson's formulas attribute to the weight of the locomotive, and all the expenses which are included under the general account "General Expenses", as none of these expenses could be saved or appreciably reduced if the use of sleeping cars were discontinued.

The result of these estimates leads me to the con-

clusion that so far from being a burden on the passenger business, the operation of these sleepers is a distinct benefit to that service, unless the defendants' contention is sound that I must assume that if the sleepers were not run, the passengers transported therein would be transported in day coaches at much less expense, which subject will be considered later.

The claim of the defendants in regard to the railway fares earned in these sleeping cars is substantially this: they claim, first, that under the statute of 1875, railroads are not required to furnish sleepers or to transport passengers therein; that if the railroads did not transport passengers in sleepers, the passengers who travel therein would travel in day coaches, and that on this particular railroad, the average loading of the day coaches is so small that all the passengers carried in sleepers could and would be carried in the day coaches, and that therefore a pro rata share of all the expenses of carrying on the passenger business of the complainant, except the "Traffic Expenses", must be charged against the sleeping cars. To assign the expenses, they adopt the formulas hereinbefore referred to, prepared by Mr. Thompson.

It therefore becomes necessary to describe these formulas or ratios, and to consider the soundness of the defendants' contention with reference to their application.

Mr. Thompson first assumes that there are five distinct businesses carried on on complainant's trains; the first business is the transportations of passengers in day coaches, including their baggage; then the sleeping car business; then the dining car business; then the mail business; and then the express business.

He determines as between baggage and mail and express, the relative floor space occupied by each in the baggage cars and then assigns on this relation to baggage

and to mail and express a portion of the weight of those cars and their loading. Thereafter, he treats the weight assigned to "Baggage" as part of the weight assignable to passenger service, but the remaining weight of the baggage cars is treated as the only weight assignable to the mail and express. The weight of the "Sleepers and Diners" and their loading is assigned to the business "Sleepers and Diners", the weight of all the passenger cars and their loading, plus the weight previously assigned to baggage, is assigned to the "Passenger and Baggage" business. These respective weights are then multiplied by the total number of miles which each class of cars respectively is transported during the year, and the respective totals show the "gross ton miles" assignable to each business: "Passenger and Baggage", "Mail and Express" and "Sleepers and Diners". From these totals percentages are calculated upon which, as I have said, the bulk of all the passenger expenses are divided.

The bulk of the expenses, not divided on the ton mile ratio, are divided on the car mile ratio, which ratio is derived from the mileage run by the different classes of cars, without reference to their relative weights. There are also minor ratios used for the division of certain expenses, which are relatively small in amount. These ratios, I think need not be here described. Also there are certain expenses which Mr. Tompson divided upon the basis of the results arising from the divisions made by the application of the ratios.

The result of the application of this method of dividing the expenses attributed to the Michigan passenger service as the same have been determined by me would be for 1912.

1912.—Total Michigan Passenger Expenses—$601,696.

Assigned:

		Percent
Passenger and Baggage	$409,000	=57.98
Mail and Express	65,250	=10.84
Sleepers	95,789	=15.92
Diners	31,657	= 5.26
		100.00

1913.—Total Michigan Passenger Expenses—$631,934.

Assigned:

		Percent
Passenger and Baggage	$408,757	=64.68
Mail and Express	69,815	=11.05
Sleepers	92,263	=14.60
Diners	61,099	= 9.67
		100.00

As applicable to the determination of the sleeping and dining car expenses, in accordance with Mr. Thompson's theories, defendants' counsel say in their printed brief:

> "It is claimed that to discontinue this service and take off the cars engaged in it would not reduce the expenses to the extent to which Thompson has apportioned them against it, and that the putting on of the service and cars does not increase the expenses to that extent. This we admit to be true, but that is no argument which complainant can raise against the practice. If it is an argument against the practice of Thompson, it is clearly an argument against similar practices of complainant * * *".

Faulty methods urged by complainant for the division

of expenses it would be my duty to reject; it would not justify me in the adoption of a faulty method in this matter, and the method is in my judgment faulty, so far as it relates to sleeping cars, in these particulars:

It assumes that sleeping cars are provided merely as places in which to sleep and puts them in the same category in which lodging houses would be put if such were provided by the company. It ignors the fact that sleeping cars are primarily and principally instrumentalities for transportation and that their facilities for sleeping are merely instrumentalities for transportation by increasing the comfort with which passengers can be transported. In order, therefore, to determine the expense properly chargeable against these sleeping cars, on account of the facilities which they furnish for sleeping, there must be an apportionment upon some fair basis which distinguishes between the use of the cars for transportation and their use as a facility for making transportation more comfortable.

In my judgement, if the theories of Mr. Thompson and his ratios are to be used for the purpose of determining whether the furnishing of the sleeping facility is a burden, they must be used in such a way that while attributing to the sleeping facility every expense which it adds to the transportation of passengers in ordinary cars, they shall not relieve that business from any expense which it would not escape if sleeping cars were not used. The chief reason urged for the assertion that these sleeping cars burden the other transportation business is that they are heavier than the ordinary coach. This is true, I think, therefore, that a reasonably fair test of the burden, if there be one, caused by the extra weight may be determined by assigning to the passenger transportation business, of the weight of each sleeper, the average weight of one passenger coach used on complain-

ant's road in the trains on which such sleepers are carried, and treating the remaining weight of the sleepers as devoted to the sleeping facility, and then determining the extra expense due to transporting the weight thus assigned to the sleeping facility.

I have caused calculations to be made on this basis, using Mr. Thompson's ratios and methods exactly as he uses them, but applying them to the Michigan passenger expenses as I have determined them, and the result is to show an extra expense due to the sleeping car business for the year 1912 of $9,403, and for the year 1913 of $9,313.

If we compare these expenses with the net revenue from the sale of berths and seats in sleepers heretofore shown, it might be claimed that the sleeping car service of the complainant was a burden on its other passenger transportation business in the year 1912 to the extent of $224 in added expense, and that no return was earned upon the proportion of the value of the sleeping cars which should be assigned to the sleeping car facility.

To determine this value, I have assigned to the business of transportation, such portion of the average value of the sleeping cars as is the equivalent of the average value of the complainant's passenger coaches run in the trains in which complainant's sleepers are carried. This will assign to the sleeping car facility $34,531 of value out of the total of $65,566.

If, however, from the above computations, we should conclude that the running of sleepers is a burden on the other passenger transportation business, it would be because we disregarded entirely the reason for the service, and the incidental benefits accruing therefrom to complainant's passenger business as a whole.

That there is such benefit, the undisputed testimony in this case established beyond possibility of contradiction. Thus the defendants' witness, Mr. Thompson, who testi-

fied that, as a matter of cost accounting, the method for which the defendants contended was the proper method, upon his cross-examination, testified:

Q. How about the sleeping car—if they discontinued the sleeping car, don't you think it would be very bad business?

A. Yes, I think it would.

Q. Don't you think if they discontinued the dining car and sleeping car in this territory, competitive as it is, that it would ruin their business—utterly ruin them and wreck them?

A. You mean as a whole railroad or to do with the intrastate passenger business?

Q. Passenger business as a whole.

A. I take it as to their passenger business as a whole they could not do it.

Q. It would ruin them wouldn't it? Ruin their business?

A. I am not expressing an opinion as to what would ruin them.

Q. You think it would result in heavy loss and it would be unjustified?

A. I think it would be bad business.

Q. Very bad—it would be foolish, wouldn't it?

A. Probably it would.

The evidence shows that a very large part of the public served by complainant's railroad are in centers where there is active competition with other railroads which furnish sleeping car service. This is not only true of interstate business, but it is largely true of intrastate business. Every passenger who travels either inter or intra on complainant's road when otherwise he would travel on some other road, manifestly brings a profit to this road if the amount he pays for transportation exceeds his proportion of the expenses of running the train

on which he rides, because the other charges have to be incurred in any event.

On a road like complainant's, where there are no trains devoted exclusively to the carrying of interstate passengers, but where both inter and intra passengers are carried on the same trains, any inter passenger who travels on this road where otherwise he would travel on some other road, helps to decrease the cost of the transportation of intra passengers to the extent that the fare paid exceeds the passenger's proportion of the actual train expenses of the train on which he rides. These things are axiomatic.

There must also be other benefits accruing from the use of the sleepers. Can it be doubted that many people ride in the day coaches during the daytime, who would not ride therein except that when night arrives, they can get the benefit of a sleeper?

The defendants, however, claim in effect that all the passengers who are carried in the sleepers, would, if the sleepers were not provided, travel in the day coaches, and that the evidence proves that there is ample capacity in the day coaches already provided to take care of this sleeping car traffic. I am unable to see how this claim can be sustained.

The testimony does show that the average number of passengers carried in all coaches, sleepers included, is only 13 per car, but this does not necessarily mean nor does it show, that the day coaches provide very much more seating capacity than is necessary for the business done in them. It is not to be supposed that every seat in every car will be occupied all the time. Provision must be made for the *maximum* number of passengers who will ordinarily be in a car at any time on the run between divisional points, rather than for the *average* number on such run. Such testimony does not show that there is

enough extra space in the day coaches now run to provide for the passengers now carried in sleepers. It does not even tend to show it for the sleepers are run on the principal trains, and the average is obtained from all the trains. We have no data upon the average loading of the trains to which our inquiries are directed, except that it can be gathered from the testimony of Mr. Maney that the loading of the trains hauling sleepers is above the average.

Let us assume that the contention of defendants in this regard is sound. Manifestly their assumption that all of these sleeping car passengers would travel in these day coaches is unwarranted. The most that can be said is that probably some of them would. It must not be forgotten that convenience of travel necessarily stimulates travel. People who would make trips locally on complainant's road if they could do it at night under comfortable conditions, would often not make such trips if it involved either a long day ride or sitting up all night.

In addition to these considerations, it is apparent from the testimony that if the complainant did not run these sleepers not only would a large proportion of the intra passengers who ordinarily travel on complainant's road in its sleepers, take other roads where sleepers are provided, but that it could expect little business from the similar class of inter passengers, if a competing line affording this accomodation could be found, and the evidence shows that there are such competitive roads in practically every direction.

It is doubtless these considerations which led Mr. Thompson to the conclusion which he reached, and to which reference is made above, that it would be a very foolish thing for the complainant to discontinue its sleeping car business.

My conclusion is that it is clearly established from the evidence that so far from the sleeping car business, as conducted by the complainant being a burden on its other passenger business, it is a distinct benefit, not only by reason of the earnings from the sleeping cars, both for the transportation of passengers, and from the sale of seats and berths, but from the fact that if it were discontinued, there would be a loss of revenue so great that the profits in the passenger transportation business would not be so great as they now are.

What is here said of sleeping cars would apply also to parlor cars or chair cars mentioned in the statute of 1875 above quoted. The complainant does not use any exclusive parlor or chair cars, but does run two cars which are called "Dining and Observation cars", part of the space therein being devoted to chair car service and part devoted to dining car service. There are no data in the testimony which show the relative space or weight devoted to the two services.

Mr. Thompson, in his computations, treated these two cars as though they were exclusively devoted to dining car service.

The conclusion that the sleeping car service is not to be treated as an outside operation chargeable with a proportionate share of all costs, according to the theory of defendants, finds strong confirmation in the fact that that theory involves one or the other of two impossible assumptions. It is deducible from the evidence that when the sleeping cars are so treated, their operation results in a heavy annual loss, which in 1913 would have amounted to $115,555.

In so treating the sleeping cars the defendants must assume either that the company will voluntarily incur this annual loss by continuing to operate the cars, or that

the abandonment of the sleeping car service will involve no diminution of passenger earnings.

Either of these assumptions is impossible. Certainly the company would not continue to operate the cars at such a loss; and the evidence is all to the effect that an abandonment of the service would cause a heavy loss in the passenger business. The seriousness of that loss is shown not only by the testimony of complainant's witnesses, but by that of defendants' witness, Mr. Thompson. When he says that it would be foolish for complainant to abandon the sleeping car service, he means necessarily that such abandonment would cause a loss in net passenger earnings of more than the amount of expense thereby saved, which, in 1913, would have been approximately $30,000.

Dining Cars.

The dining car service cannot be credited with any transportation earnings, but only with earnings from the serving of meals. These earnings are not sufficient to pay expenses, but result in a considerable annual deficit, averaging $5,689 for the four years 1910 to 1913, and being $9,337 in 1913. This deficit the defendants claim cannot be charged to the passenger business to which the prescribed rate applies, for the same reason as was urged in connection with the sleeping cars, viz: that the conveniences thereby furnished, although furnished to passengers in transportation, are operations outside of the regular busines of transporting passengers, and must, if carried on, be self-supporting. This claim raises the question whether the providing of means by which passengers in transit may eat in comfort without involving any delay of the trains, is a reasonable provision for a railway company to make in carrying on its passenger business. There is no question that a railroad

may make some provision for the needs and the comfort of its passengers, and that the attendant expense is properly chargeable to the business of transporting passengers, provided such provision and such expenses are reasonable. The question here, therefore, is whether the operation of these dining cars, and their attendant expenses, are reasonable; and as there is no claim that the expenses here charged are exorbitant or otherwise improper, provided the service itself is proper, the sole question here is whether the operation of dining cars is a reasonable provision. It is not denied that the company may, in connection with its passenger business, furnish passengers with accomodations for eating, but it is claimed that such provision is an outside operation, and must be self-supporting—that that portion of the traveling public that does not avail itself of the facility must not be made to pay a part of the expenses of furnishing such facility to those who do avail themselves of it.

On the other hand, the complainant claims that the operation of dining cars, although at an apparent loss, is, in fact, a measure of economy, and on the whole, profitable to the company, because it avoids the necessity of providing eating accommodations at stations with their expense, and avoids also the delay of trains thereby entailed; and there is testimony in the case in support of this claim. That dining cars, as a provision for the needs and comfort of passengers, are superior to eating houses at stations, there is no question and it may well be true that they are also, on the whole, more economical for the railroads, but I find that it is unnecessary to inquire here whether their operation is or is not a measure of economy as claimed. I find that the providing of eating accomodations for passengers is not only a right, but a duty of the railroads: that the form and method of pro-

viding these accommodations are matters to be regulated by them in their discretion, and that the courts, although they will not permit it to be abused, will not review that discretion for the purpose of ascertaining whether it has been profitably or wisely exercised, where, as in this case, no abuse of it is claimed to exist.

If the foregoing finding is erroneous—if it is the duty of the court to review the judgment of the complainant's managers in deciding to operate dining cars as a part of their passenger business and therefore incumbent on the Master to find whether such operation is or is not a reasonable and proper provision made in the course of the carrying on of the passenger business to which the prescribed rate is applicable, I find that the operation of dining cars as carried on by the complainant is a reasonable and proper provision for the needs and comfort of passengers being transported by them in the course of their passenger business, and that the earnings and expenses of the same as set forth in the complainant's testimony and exhibits, are therefore to be treated as part of the earnings and expenses of the passenger business to which the prescribed rate is applicable.

This finding is based on the testimony, not only of the complainant's witnesses, which shows that such dining car service is furnished by all the important and well managed railroads in the country as a component part of their regular passenger business, but also upon the testimony of the defendants' witness, M. W. Thompson, who, although the originator and proponent of the theory that sleeping and dining car operations should be treated as outside operations, and therefore excluded from consideration in testing the fairness of passenger rates, disclaims in his testimony any intention of claiming that the sleeping and dining car service should be abandoned by the complainant and expresses the view that, in his

opinion, such an abandonment would be a foolish thing for them to do.

To my foregoing conclusions on the subject of sleeping and dining cars defendants object (Objection No. 16). The subject of sleeping and dining cars referred to in this objection was fully discussed in connection with my findings on the subject, both upon principle and authority.

With regard to the *Dakota Coal Case*, again cited by the defendants under this objection, I do not find any conflict between it and the conclusions reached by me; and with regard to the *Ann Arbor Case*, also cited, the questions on this subject raised and litigated in this case do not seem to have been raised at all in that case.

Here and elsewhere it seems to me the defendants, in their vigorous contention for the strength and sanctity of the presumption of the validity of legislative action, neglect to give due attention to the chief question that arises in the interpretation and application of every statute, viz: the question of the legislative intention. They assume here that the legislature, in enacting this statute, intended to prescribe a rate of fare which would need to pay merely for bare transportation, without regard to the customary provisions for the comfort or convenience of the passengers transported. It appears from the evidence that if the sleeper and diner services must be treated as outside operations; and, in addition to the extra expense due to their operation, must be charged also with a pro rata portion of the operating expenses that would necessarily be incurred if there were no such operations, the company would be obliged to either furnish these services at a heavy annual loss, or

else abandon them altogether,—which means, of course, that they would be abandoned.

Now are we to presume that the legislature, in enacting this statute, intended to prescribe a rate of fare that would compel such abandonment? I cannot believe that we are,—cannot believe that the legislature intended that the statute should be so applied as to cut off this provision for the convenience and comfort of passengers, or that it had any intentions in this regard, other than to prescribe a rate that would afford a fair return from the passenger service as it was then being rendered including all the then existing provisions for the comfort and conveniences of passengers.

But, even if the legislature did so intend, such intention could make no material difference in the case unless the net passenger earnings, by which the validity of the rate is to be determined, would be greater from the sole operation of the day coaches than they are found to be from their joint operation with the sleeping cars. The defendants' contention that they would be greater rests entirely upon the assumption that the complainants would continue to operate the sleeping cars even though they are held to be outside operations and as such chargeable with a large amount of expenses, which would otherwise have to be borne by the day coaches. It is clear that such assumption cannot be made; but that the contrary must be assumed, viz, that if the sleeping cars are to be treated as outside operations as claimed by defendants, all calculations must be based upon the assumption that day coaches alone will be operated; and it is, therefore, the results to be anticipated from such operations alone that are to be estimated; and such being the case, it follows that the estimate must be based on the results realized from past operations of day coaches alone, and that they cannot be based upon results realized from

their operations jointly with other classes of cars. But we have no basis for such an estimate in this case, as the different classes of cars were operated jointly in each of the four years, for which the results of operations are shown and we cannot, therefore, make a direct estimate of the results to be expected from such sole operations in the future. But the latter can be estimated indirectly by estimating the excess cost of joint operations and deducting it from the total cost of joint operations. This excess cost has already been estimated herein from which the conclusion is reached that the sleeping cars do not burden the passenger service, i. e., that the revenue from the sale of berths and seats is sufficient to cover the excess cost of their operation. If that conclusion is correct, the net earnings from the sole operation of day coaches would be no greater than from their joint operation with sleeping cars. And this even though the volume of passenger traffic remained the same, which the only witness on the subject estimates would be reduced by fifty percent of that now carried by the sleeping cars.

(2)—*Mail and Express.*

The next question raised by defendants in this connection relates to Mail and Express business. Their claim is that these also are "outside operations" and that therefore the revenue and expense of these services should be excluded in determining the effect of the rate in controversy here.

The complainant throughout the trial, until the oral argument, treated these services as part of the passenger business; but in the oral argument was inclined to regard them as outside operations, on the ground that a prescribed passenger rate of fare otherwise reasonable could not be rendered unreasonable by a loss in the car-

rying of mail and express, and conversely, that a passenger rate otherwise unreasonable could not be made reasonable by a profit derived from mail and express operations.

The first of these two propositions is entirely clear—certainly the company could not render unreasonable a passenger rate that was otherwise reasonable by carrying on other operations at a loss; but the second or converse proposition is not quite so obvious. A rate which would be unreasonably low for the transportation of passengers in trains operated exclusively for passenger traffic, might not be so for such transportation in mixed trains earning additional revenue from other transportation; and it would seem that the legislature, in fixing the rate in question, took such additional revenue into account. By the terms of the statute itself, the question as to when the 2¢ rate shall and when it shall not apply is made to depend not upon the amount of passenger earnings, but upon the amount of passenger train earnings, which would, of course, include any other earnings that there might be from other transportation effected by the train; and if this was allowable, the question of reasonableness would be not whether the passenger earnings proper would suffice to pay a fair return upon the value of the property employed for the passenger business exclusively, but whether the entire earnings from the train would suffice to pay a fair return on the value of the entire property employed in the operation of the train. If, therefore, the legislature has power to make one branch of the service pay the expenses of another branch, and if the present proceedings were one to test the reasonableness of the rate as part of the train revenue, it would seem that the mail and express business could not be treated as outside operations but must be included.

But this is not such a case, and according to recent decisions, the legislature has not such power. The question here is not whether the rate in question will, when taken in connection with the revenue from other property, yield a fair return on the value of all the property employed in earning the several revenues, but whether it will, in and of itself, yield a fair return on the value of the property employed wholly in the service to which the rate applies. It is a case of alleged confiscation, and, as such, the sole question is whether the rate complained of will yield a fair return upon the value of the property required to be used in the particular service to which the rate applies. As such is the issue here, and as the mail and express businesses are clearly no part of the passenger business proper, those businesses should be excluded from consideration, notwithstanding their apparent inclusion by the legislature in prescribing the rate.

It follows that to the mail and express business must be assigned its proper proportionate share of the expenses which I have assigned to the complainant's passenger business. This I have done by applying Mr. Thompson's ratios hereinbefore described exactly as he applied them to his own estimate of the same expenses.

Mr. Thompson prepared no ratios applicable to the expenses of 1910 or 1911. But as the percentage of the total passenger operating expenses attributable to mail and express for 1912 and 1913 are practically the same in each year, viz, 10.8 in 1912 and 11.05 in 1913, I think in determining expenses attributable to mail and express in 1910 and 1911 I may use the average of the two years, viz, 10.92, and I have done so.

In view of our general knowledge that the United States mails are in very great part handled on trains by servants of the government, known as mail clerks, and

of the fact shown by the evidence that the express business is done by the Western Express Company, the railroad company only doing the necessary carrying, it may be doubted whether a proportionate part of the general expenses which include the salaries of all general officers and their clerks should be thus assigned to complainant's mail and express business. For the same reasons, it is doubtful whether a proportionate part of the wages of the conductors and brakemen of passenger trains should be charged against the mail and express business.

If, however, a part of these expenses should be charged to mail and express, and a part should not, I have no data in the testimony by which I could make an apportionment of the amount which should be so charged and am therefore compelled to use the methods above described.

If a proportionate part of the expenses of operating complainant's passenger trains is to be charged against the mail and express, it would seem to follow that a proportionate part of the property, which I have assigned to the passenger business must also be apportioned to mail and express. Such an apportionment should be on the basis of relative use of the property. In view of the fact that all of the property affected is common—that is, common to the business carried on on complainant's passenger trains, it would seem that there is no absolutely accurate method of making such a division. Mr. Thompson's ratios for dividing expenses are, so far as is practicable, based on relative use, and it therefore seems to me that a fair division of property may be made on the relation of the total assignments of expenses arrived at as hereinbefore under this heading stated, which will assign 11.05% of the value of the passenger property as determined by me to mail and express. I have used this

method but before applying the percentage, I have deducted from the value of the passenger property the proportion of the value of the baggage cars as I have found them, which Mr. Thompson's testimony shows is devoted to the mail and express business. The assignment to mail and express for these cars is $25,090, and my total assignments of property to mail and express are $462,292.

I have apportioned taxes to the mail and express property on the relation of its value to the value of the entire passenger property.

The revenues received by complainant on account of its mail and express business are assigned to that business.

The results of the use of all the foregoing methods are shown in Exhibit 7 to this report.

If the foregoing conclusions are sustained, no division of mail and express property, revenue or expenses, between the intra- and interstate services is necessary. But such division has been made elsewhere in this report, and there I have decided every question raised by the parties with reference to such divisions between intra and inter, and in my exhibits I have treated all the property apportioned to the passenger service as passenger property, so that whether it shall finally be determined that mail and express are to be included as part of complainant's passenger business, or are to be excluded therefrom, every necessary division can be made.

Division of Revenues.

Except as to a few comparatively small items, there is no dispute between the parties as to the amount of the revenues of the complainant in their Michigan passenger business. Those items are as follows:

1. The defendants claim that certain passenger earn-

ings of the Mackinac Transportation Company should be included in complainant's passenger earnings. This question has already been fully considered in connection with the question whether the property of this transportation company should be included in complainant's inventory. It was there found that none of the property of the Mackinac Transportation Company is employed in the passenger service to which the rate applies, and that none of its property should be included in the inventory of passenger property; but that its property was employed in the joint freight service of the complainant and the two connecting companies, and that one-third thereof should be included in complainant's inventory and all allocated to freight. That finding covers the question here raised and requires that the passenger earnings of the transportation company be excluded from those of the complainant company.

2. The complainant receives certain dividends from the South Shore Land Company, Ltd., a company the capital stock of which the complainant owns, and the defendants claim that these dividends should be included in complainant's revenue.

Neither the stock of this land company, nor the property which it represents is included in the valuation of complainant's property, nor has its business any connection with the operation of the railroad. I therefore can see no reason for including these dividends or any part of them as part of complainant's passenger earnings.

The grounds on which the defendants claim that they should be included is that the business of the land company in whole or in part is attended to by persons who are officers or employes of the complainant company, and who thus give to the land company time and labor

which belongs to and is paid for by the complainant company.

I find it to be a fact that some of the business of the land company is attended to by the treasurer of the complainant company; and that insofar, if at all, as the land company thus receives the benefit of services that are paid for out of the expense accounts of the complainant company, those accounts are erroneous and should be corrected, but that such error furnishes no ground for crediting the passenger earnings of the railway company with the dividends of the land company. The complainant claims that the passenger expenses of the complainant company have not been increased at all by reason of the services rendered by any of its employes to the business of the South Shore Land Company; that the services thus rendered were slight and of a routine character, and involved no interference with the performance of the employes' duties to the complainant company. I am unable to find from the evidence that the complainant's expenses have been increased in any amount by reason of the above mentioned services, or that there has been any neglect of duty to the complainant company by reason of those services; and am satisfied that the rendition of the services in question is not of enough importance to have any material bearing on the merits of this case.

3. There is a slight difference between the parties as to the amount of mail revenue, amounting to $200 and accruing in the accounts for the year 1913. I am unable to find how this difference arises. The figures which I have allowed include all the revenue which I can find from the evidence the complainant actually received in that year. If there is an error of $200, the error should, of course, be corrected.

4. There were certain rents received by complainant

from buildings not in railroad use, which the defendants claim should be included in the complainant's statement of revenue.

The property from which these rents are derived not being in railroad use and therefore not being included in the valuation of complainant's property in this case, it is difficult to see how the rents in question could properly be included in any statement from which the complainant's net passenger earnings is to be computed. The reason given by the defendants for this claim is similar to that given relative to the dividends from the South Shore Land Company, and what was there said by me with reference to that claim is also applicable here.

The grounds of the claim as specifically stated by defendants is as follows:

> "The deductions as made by complainant from income, are, however, too great, as the entire gross income from rentals is deducted with no crediting to the deduction of taxes, expense of rent collections, drawing leases, supervision of the property, repairs and renewals, and other like items, which in aggregate, are probably sufficient to fully offset the income. Unless these things can be separated, the income must be left in in entirety."

I can see no propriety in including as income in this case rents received from property that is not in railroad use and not included in the valuation of property in this case. If the expense account submitted here included any expenses incurred in carrying or caring for such property, the expense account is erroneous, and should, to that extent, be corrected. I am unable to determine from the evidence whether there is such error in the expense account, but am satisfied that if there is any such error, it is too small to have any appreciable effect in this case.

5. Under the heading "Miscellaneous Rents" the defendants specify certain rents received for rails and other property loaned by the complainant to industries along their line, and claim that those rents also should be included in complainant's statement of income.

This claim is similar in all respects to that last preceding. The property from which these rents are received is not included in my valuation of complainant's property nor is it used by complainant in their railroad business; and for the same reasons as stated in connection with preceding similar claims, I find that these rents should not be included in complainant's income in this case.

6. In the revenues for 1913, under the heading "Outside Operations—Net", the defndants claim these earnings to be $$8,066.69, while the complainant's statement shows them to be only $725.32. The revenues referred to are those received from the sleeping and dinnig car service only; that is, the revenue from sale of seats and berths in the sleeping cars, and from meals, etc., served in the dining cars.

In determining these revenues, complainant assigned to Michigan the revenues of all dining cars operating exclusively in Michigan, there being no car operated jointly in Michigan and any other state. The expense of the dining cars in Michigan were determined by dividing all expenses of all the dining cars on the system on the relation of the miles made by the cars in Michigan as compared with the miles made in other states.

The earnings received from passengers for occupying sleepers wholly between points in Michigan were assigned to that state, as well as its proportion of the revenues derived from passengers for occupying sleepers within two or more states determined by the miles of occupancy in each state respectively. Of the expenses

of all the sleeping cars on the system there was assigned to Michigan its proportion based on the number of miles made by those cars in all states.

By the method adopted by the defendants, the revenues from both sleepers and diners were first separately assigned to states on the basis of the revenues received from passengers in each state, and the expenses were separately assigned to states on the basis of the car mileage in each state for each class of service.

It is my judgment that the method adopted by the complainant is the more correct one, and I have adopted it.

To the above finding "6" defendants make objection. (Objection No. 17 (b). The objection is:

> "If the sleeper and diner operations are permitted to remain as part of the passenger operations of complainant in determining the sufficiency of the two-cent statutory rate, then the earnings of such operations, claimed by the defendants to be $8,066.69, or at least $3,989 thereof, should be included in the Michigan earnings, instead of the earnings of $725.32 claimed by complainant and included by the Master."

The objection here is that the net earnings from the sleeper and diner operations of the complainant in Michigan should be $8,066.69, or at least $3,989 thereof, instead of $725.32, as I have found them to be. This objection applies to the earnings for the year 1913, and to the extent that it is sound as to that year, it will require an adjustment of these earnings in the other three years.

The argument is that in my tentative report at page 263, I say that the complainant "assigned to Michigan the revenues of all dining cars operating exclusively in Michigan." It is claimed that there is no proof of such

an assignment, and that in the absence of such proof, these revenues should be divided in proportion to the revenues received from the transportation of passengers in the respective states.

The method of division thus suggested would certainly not be a proper method if division was necessary, but no division is necessary, as the evidence clearly shows that the dining cars operated in Michigan are operated in no other state, so there is no question of the assignment of their revenues between states, and therefore no reason for any division. It would appear that my use of the word "assignment" was inaccurate.

It is stated under this objection that the expenses of both sleepers and diners were divided between states by complainant on the basis of the mileage of all cars of the class including the sleepers and diners of other companies. Defendants are mistaken. The division was made only on the mileage of complainant's cars, but a portion of that mileage was not made on complainant's road, as it included mileage made on the Mineral Range Road. This inclusion was necessary in order to make the proper division between states, as it appears from the testimony that some of complainant's sleepers and diners operate on the Mineral Range Railroad between Houghton and Calumet, and that the complainant receives all the revenues and pays all the expenses of such operation.

Defendants contend that the assignment of expenses of the diners between states should be made on the relation of their earnings in the respective states, and not on a car mileage basis. They point out that the result of the car mileage basis is to assign to Michigan a greater proportion of expense than of revenue, and claim that this ought not to be. I agree with them, and shall divide those expenses by assigning to the Michigan business the

same proportion of the expenses as its revenues bear to the total revenues from dining cars.

7. In the same year the defendants show a credit to the amount of $1,658.47, on account of "hire of equipment". There is no real dispute between the parties on this item, because the defendants offset it by a debit item which makes it agree with the figures of the complainant which I have adopted.

8. There are certain revenues received by the complainant amounting to less than 1% of its total revenues in Michigan, which are not directly assignable to either the passenger or the freight service. I have divided these items between the freight and passenger service on the relation which the totals of the items which can be allocated in each service respectively bear to the total allocated revenue. I do not understand that there is any disagreement between the parties that this is a proper method. The defendants arrive at a different results by using a different percentage, but it is a percentage for which I can find no explanation in the briefs or basis in the testimony, and I therefore leave the matter as it stands, subject to correction, if found erroneous.

Division of Michigan Passenger Revenues Between Intra- and Interstate.

It now becomes necessary to divide the Michigan revenue between the intra- and interstate business. The fares received from passengers, which constitute the great bulk of these revenues, have been allocated between these services. Some other revenue has been so allocated, as is indicated by the use of the word "actual" in the statements, Exhibits 2, 3, 4 and 5.

The revenues which could not be allocated have been apportioned by me on the basis of the allocated revenue

from passenger fares. Although this method is somewhat arbitrary, I think that it is a fair method, and I am of opinion from the testimony that it does not err by assigning too little to the intra.

There is no disagreement with reference to items which I have thus divided, except as to the items Mail and Express, and "Outside Operations" (Sleepers and Diners).

It is the contention of defendants that mail and express carried on trains which run exclusively in Michigan must be regarded as wholly intrastate business, regardless of the connections of such trains with interstate trains of the complainant and of others. I am not able to concur in this view. The evidence shows that every train on the complainant's road running exclusively in Michigan which carries mail and express connects with an interstate mail and express train of complainant or of some connecting carrier, and most trains carrying mail and express have several such train connections.

In view of the railroad geography of the Upper Peninsula, and the fact that the interstate freight business of the complainant is vastly larger than the intrastate freight business, it is not believable that the bulk of the mail and express business on complainant's railroad is not inter rather than intra business, but my finding gives the greater portion of the mail and express revenues to the intra business in order that any doubt that there may be on the subject may be resolved in favor of the defendants.

With reference to the express business the defendants make practically the same contention, and for the same reasons as those last above given, I find the contention not sustainable.

I am not able to determine, either from the oral argument of the defendants or from their briefs, in what man-

ner they have divided the revenues from sleepers and diners between Michigan intra and interstate passenger. My assignment gives to the intrastate practically two-thirds of the entire net revenue from the sleepers and diners. The evidence shows that the sleeping car business was carried on at a profit and the dining car business at a loss in each of the four years. The evidence discloses just where these sleepers and diners run, and from that evidence it appears that if the accounts could be allocated, it would be shown that the revenues derived from the interstate traffic were greater than the revenues derived from intra. It has been the contention of the defendants throughout this case that the sleeping cars were run chiefly for interstate business and were a burden upon the intrastate business, and I am unable to see how their method of division which assigns more of the revenue of this business to the intra service than to the inter can be harmonized with that contention.

Income Due to Unearned Increment.

Under this heading, the defendants ask me to find as follows:

"If the cost of reproduction or replacement value is as claimed by the complainant to be taken as the value of its property, then the unearned increment or the increase in value of its property from year to year must be proven by it and taken as income and added to the revenues of the particular year in question."

And in their printed brief (page 238) they say: "We must insist that no claim of confiscation can be made out without this factor being proven and that the burden of such proof is on the complainant as it must clearly show confiscation to exist before it will be relieved from putting the rates into operation."

This claim, if allowed, would, of course, like the others

which call for similar proof, put an end to the case, as the complainant has not made such proof and indeed, in the nature of things, cannot do so. But the claim cannot be allowed. It could not be allowed without not only coming into conflict with the Minnesota rate decision, but also striking at the very foundation of all private property. In that decision the right of the company to profit by the increase of property values was fully recognized and it requires but a moment's reflection to see that this right which is here and frequently elsewhere referred to by the name given it by the distinguished writer of imaginative economics, Henry George, is the most vital and fundamental of all property rights. To treat it as income would be both wrong in principle and impossible in practice. To do the former would be to deny it in part, and to do the latter would require a finding that at the beginning of every year involved the property under consideration was of a certain value and at the end of every such year it was of a certain greater value. This would be manifestly impossible in practice and if it could be and were done, it should, of course, carry with it as a corollary the converse principle, viz: that wherever the end of a year showed a decrease instead of an increase in value, the income instead of being augmented by an "unearned increment", should be diminished by an undeserved decrement.

I am unable to see how the theory of unearned increment can be reconciled with established principles or practically applied in a rate case.

Division of Operating Expenses.

Division of Operating Expenses Between States.

It now becomes necessary to determine the amount of the operating expenses of the complainant's passenger business in Michigan. To do this it is necessary to

divide the entire operating expenses between states. This presents very little difficulty as the parties are agreed in their figures. The method adopted for the division and its results are shown in Exhibit 6 hereto attached.

Having made this division, we have the entire operating expenses of the complainant in Michigan, and those expenses must be divided, first between passenger and freight, and then the passenger proportion between intrastate and interstate.

Division of Operating Expenses Between Passenger and Freight.

On the average of the four years' accounts under consideration in this case, at least 66½% of the total operating expenses as between the freight and passenger services have been actually allocated or definitely assigned upon bases accepted by both parties. Very much more than half of the expenses which cannot thus be allocated or assigned consist of the expenses of maintenance of way and structures.

Of these, certain items have been divided upon bases agreed upon by the parties as suitable.

Of the expenses of maintenance of way and structures, the great bulk are attributable to property used in common by the freight and passenger departments. A considerable amount of these expenses is attributable to exclusive freight property, and an inconsiderable amount to exclusive passenger property. The records and accounts of the complainant were not so kept that the expenses attributable to these exclusively used properties, respectively, could be separated. After the decision in the Minnesota rate cases, it became abundantly clear that some separation must be made, and testimony was introduced by which such separation could be made

upon fairly satisfactory bases. The exclusive freight property referred to consisted of some branch lines used wholly for freight service, of industrial and mine spurs, and of main and branch line side-tracks. The property used exclusively by the passenger department consisted of a comparatively few side-tracks.

The mileage of main line, of branches, of industrial and mine spurs, and of side-tracks on complainant's road, are all shown in the evidence, and all tracks have been allocated either to freight, to passenger, or to common freight and passenger. It was established by the evidence in the case that the annual cost of maintenance of industrial spurs on complainant's road is not to exceed $300 per mile, and the cost of maintenance of mine branches is not to exceed $375 per mile. It was also established by the evidence that on complainant's road the cost of maintenance of side-tracks is not more than one-third of the cost of maintenance of main line tracks. Therefore, to obtain the cost of maintenance of exclusive freight and passenger tracks in each year, the following method was used: The cost of maintenance of the industrial spurs and mine branches was first ascertained by multiplying the mileage of industrial spurs by $300 and the mileage of mine branches by $375. The result was deducted from the total annual maintenance of way and structures expenses, and the remainder then represented the cost of maintenance of main line and of side-tracks. To ascertain the cost per mile of maintenance of main line and side-tracks, the side-track mileage was equated by treating three miles of side-tracks as equivalent to one mile of main line track. Therefore, to the main line mileage was added one-third of the total side-track mileage, and the result, divided into the total expenses of maintenance of main line and side-tracks, showed the cost of maintenance per mile of the main line, and of the

side-tracks as equated. The total freight main line mileage was then multiplied by the main line cost per mile as above ascertained, and one-third of the total freight side-track mileage was multiplied by such main line cost per mile, the result being to attribute to the freight service its proper proportion of cost of maintenance of exclusive freight main line and side-tracks. A similar computation was made to ascertain the cost of maintenance of exclusive passenger side-tracks. The detail of the calculations by which the results were obtained for each year is shown in Note 15 to my Exhibit 6.

To my findings in this regard defendants direct their Objection No. 7. It consists of four subdivisions, "(a)", "(b)", "(c)" and "(d)". I treat them in order.

(a). The objection is that I have assigned too small an amount of maintenance charges to exclusive freight trackage. The claim is that I have failed to apportion to freight expenses the maintenance expenses of 13.06 miles of exclusive freight trackage which in my valuations I allocated to freight service.

I find that this object is well taken in the following particulars. The maintenance of expenses of the Bessemer Branch, 2.23 miles, and the south 2 miles of the Republic Branch, should clearly be apportioned to exclusive freight trackage; but whether the expenses of the 8.83 miles of the so-called South Line between Eagle Mills and Winthrop Junction, which constitutes the remainder of the track in controversy, should be so apportioned, is not so clear. The complainant claims that this 8.83 miles should be treated as common track, upon the ground that it is maintained for passenger use, and occasionally used for detouring passenger trains. This con-

tention is based on the testimony of Mr. Lytle, general superintendent of complainant, who testified that eight and a fraction miles of the said South Line was so maintained and used.

To this contention defendants reply that the evidence showed that east of Negaunee this South Line is not and cannot be used for passenger service. Upon an examination of the testimony, I find that Mr. Lytle was in error, and could not have meant to refer to the entire 8.83 miles but only to 4.23 miles between Negaunee and Winthrop Junction. With reference to the 4.6 miles east of Negaunee, the evidence is conclusive that it is not used for main line service at all, but is a main branch serving the Queen and Negaunee Mines. (Testimony of Mr. Riggs, Record 4202.)

I find that the testimony fails to show sufficient use of any part of this South Line for passenger service to entitle it to be treated as common track, and that the defendants are right in their claim that the expenses of its maintenance should be assigned to freight.

I find, however, that the defendants' contention that in assigning the expense of maintenance of these tracks, all of the 8.83 miles of the South Line should be classified as main line track, is in error. The uncontradicted testimony of Mr. Riggs just referred to establishes that the 4.6 miles of the South Line that lies east of Negaunee is used exclusively as a mine branch. I have therefore corrected my assignments of the maintenance expenses of exclusive freight tracks as above indicated, classifying 8.46 miles as main line freight trackage, and 4.6 miles as mine branch trackage.

In correcting this error, I discovered that in my original computation, the mileage of the Bessemer Branch was included as part of the main line, and also

as part of the industrial freight spurs. In making my new computation I have corrected this latter error.

(b). The objection is that there is error in the assumption that the cost of maintenance of exclusive freight side-tracks is only one-third of the cost of the maintenance of main line trackage.

Defendants insist that the ratio to be used should be not more than 2½ to 1, and they refer to the testimony of Mr. Riggs, Young, Lytle and Lindsay as testifying to the propriety of using the 2½ to 1 ratio.

In using this ratio I believed that I was acting upon undisputed evidence in the case for the reason that Mr. Delf, the auditor of the complainant, used this ratio, and Mr. Thompson, who was employed by the defendants to determine expenses of operation, also used it. Defendants now claim that Mr. Thompson used this ratio in reliance upon Mr. Delf's testimony.

I have examined all of the testimony to which defendants have referred me on this subject, besides much other testimony. The only direct testimony on the subject of the cost of this maintenance on complainant's road was from Mr. Delf. And this testimony is substantially confirmed by the fact that Mr. Thompson uses the same ratio. With regard to defendants' claim that in using this ratio Mr. Thompson relied entirely upon the judgment of Mr. Delf, I do not find such claim borne out by the evidence. On the contrary, the evidence indicates to my mind that he either relied upon his own judgment or upon the judgment of Mr. Hone, an engineer whom he employed as his assistant.

I can find nothing in the testimony of Mr. Riggs, Mr. Young, Mr. Lytle or Mr. Lindsay that seems to me to justify defendants' claim that I should use any other than the 3 to 1 ratio in this case. On the contrary, insofar as the testimony of either of these witnesses has any

bearing on the subject as regards this road, its tendency is to support the 3 to 1 ratio for use on this road. Mr. Young was questioned as to the cost of maintenance both of main track and side-tracks on the Lake Superior & Ishpeming Railway and the relative cost of the maintenance on that road would appear to have been about 2½ to 1, but the average of side-track maintenance on that road on the four principal sections named by Mr. Young was $225 in 1913, and $209 in 1912, whereas the 3 to 1 ratio attributed to the side-track mileage of the complainant, a cost of more than $310 per mile in 1912 and more than $326 per mile in 1913. The testimony of Mr. Young to which I refer will be found Record 8264-8270.

(c) The specific objections are that of the expense of maintenance of equipment, a part of the "Work Equipment Repairs", "Work Equipment Renewals" and "Work Equipment Depreciation" should be assigned to exclusive freight trackage; and that of the "Transportation Expenses", a part of "Superintendence", "Dispatching Trains", and "Stationery and Printing" should be likewise assigned.

With reference to "Work Equipment" expenses, I think the objection is well taken. For the year 1913 my apportionment of the Maintenance of Way and Structures expenses to exclusive freight tarcks was 12.25% thereof and, I am now assigning to the freight service the same percentage of these "Work Equipment" expenses.

The accounts "Superintendence" and "Stationery and Printing" under "Transportation Expenses" I assigned upon the overhead basis, and by this method the freight service was given the full benefit of those assignments. I can see no reason to make any change in my assignments of these accounts.

Upon further consideration, I think I was in

error in adopting complainant's method of dividing the expense of "Dispatching Trains", and that some other method should be used. As this expense is incurred in directing train and engine movements not only on common tracks, but also on exclusive tracks, I think that a train mileage ratio should be used for this dvision which takes into consideration these movements on exclusive tracks. Therefore for the division of this account I have prepared a new ratio, made up in the same way in which my modified train mile ratio was computed, except that I included all switching miles wherever made, instead of including only those switching miles made on common tracks. This ratio for 1913 assigns to the passenger expense 35.9% of this account. I have used this same ratio for the division of accounts, 63, 78, 94, 101, 104 and 105 under "Transportation Expenses" as shown in note ten to my Exhibit 6.

(a). The objection is that no account was taken of the undisputed testimony that freight spurs and sidings are entirely changed in position, and must be removed and rebuilt at least once in each fifteen years. I assume that it was the intention of the defendants to insist that this claimed undisputed testimony should have been considered by me in connection with the assignment of expense to exclusive freight tracks, although it is not so expressly stated.

I do not find in teh record the testimony referred to and cannot believe that there is any such testimony. I remember testimony to the effect that the average life of freight spurs and sidings was about fifteen years. However, the point is immaterial, as it appears from the testimony of Mr. Delf (Record pages 7752-53) that when a new freight spur is put in, the cost is charged to Additions and Betterments, and that when an old spur is taken up, the cost of taking it up is charged to Profit and

Loss. Mr. Delf's statement in this regard, and that such charges are proper, is confirmed by the rules of accounting of the Interstate Commerce Commission, complainant's Exhibit 27. I cannot see, therefore, that operating expenses are affected when a sidetrack loses its usefulness.

As to the proper division of the remaining common expenses, there has, perhaps, been more controversy between the parties than on any other question in the case. It is agreed between the parties that at least 60% of them is attributable to depreciation of the property from weather and other natural causes as against 40% attributable to the wear and tear caused by traffic.

It is obvious then, and not disputed, that a method which will determine the relative use of the property between the two services will fairly divide this 60%, and as I have already found such method in the modified train mileage basis, I have divided these expenses on that basis.

With reference to the remaining 40%, it is claimed by defendants that the larger proportion is occasioned by the freight service by reason of the heavier locomotives and cars used in the longer trains in that service, and by reason also of the defects in freight cars as compared with the passenger cars.

For the division of these expenses the defendants proposed the use of the gross ton mile ratio, meaning a ratio arrived at by multiplying the loaded weight of the trains in each service respectively, including their engines, by the miles made in each service respectively.

On behalf of the complainant, it was contended that the straight revenue train mile basis afforded the best method for the division, and they produced witnesses who testified that the gross ton mile basis would not fairly divide these expenses because the speed of a train was an

element to be considered, and that its destructive force upon roadbed was greater in proportion than the destructive force due to mere weight.

I am convinced from the testimony that the gross ton mile theory does not afford a proper basis for a fair division, because it does not give proper weight to the element of speed, and I am convinced from the testimony that the straight revenue train mile basis does not afford a proper basis for the division, for the reasons I have already given in adopting a modified train mile basis.

I am convinced, further, that it is impossible, in the present state of railroad development, to determine the relative destructive effect upon roadbed of weight as compared with speed in such a manner as to arrive at a result expressed in dollars and cents. Assuming, however, that the gross ton mile basis would afford a proper measure for the division of maintenance expenses due to traffic, it was demonstrated during the argument, and I find, that in the operations of the complainant during the year 1912, the application of this theory to the expenses caused by traffic as compared with the use of the straight revenue train mileage basis, would assign to the passenger department only $23,424 less than would be assigned to it on the straight revenue train mile basis.

It is fully established by the testimony in this case that it is the general custom among railroads to maintain common tracks and roadbed to a higher standard on account of the necessity of having a smoother and better kept roadbed for passenger traffic than would be necessary if only a freight business were done, and also that the common tracks and roadbed of the complainant were so maintained. The weight of the testimony is to the effect that this extra cost of maintenance attributable to the passenger service approximated 20%, which of itself would more than counterbalance the extra expense of

maintenance claimed by the defendants to be due to greater destructive force of the freight traffic.

Defendants' Objection No. 21 is made to my finding in the last foregoing paragraph. The objection as stated is to so much of my reoprt

> "as finds the evidence to show that the line and road of complainant is better maintained than if maintained for freight service only."

It will be observed that this does not correctly state my finding, which was as follows:

> "It is fully established by the testimony in this case that it is the general custom among railroads to maintain common tracks and road-bed to a higher standard on account of the necessity of having a smoother and better kept road-bed for passenger traffic than would be necessary if only a freight business were done, and also the common tracks and road-bed of the complainant were so maintained. The weight of the testimony is to the effect that this extra cost of maintenance attributable to the passenger service approximated 20%, which of itself would more than counterbalance the extra expense of maintenance claimed by the defendants to be due to greater destructive force of the freight traffic."

I saw and heard the witnesses who testified on this subject, and have reconsidered the testimony, and I still think that the conclusion at which I arrived is the only proper conclusion to be drawn from the testimony. There was testimony introduced by the defendants in which the witnesses gave it as their opinion that, as a matter of economy in operation, it is desirable to keep a freight

road maintained to as high a standard as one doing both freight and passenger business.

The question of railway economy thus raised is not covered by my finding here objected to, except as it is impliedly involved in the finding as to the general custom of railroads in this regard. The question of economy has not been treated as being in issue in this case, and it is manifestly a question that would be very difficult, if not impossible, to solve except by long continued practical tests. If the question were to be judged upon the testimony here, we should have, on the one hand, the opinion of three of defendants' witnesses, and on the other the general custom of railroads in actual practice. As the railroads would not follow that custom unless they considered it better economy than the opposite custom, and as their course in this regard is determined upon by practical men of large experience with their own interests at stake in their decision, I think the custom entitled to greater weight as evidence than the opinion of the engineers to the contrary. However, it must be borne in mind that economy is not the only element to be considered in this connection. There are also the elements of safety of operation and the safety and comfort of the passengers. It is self-evident that the consideration of safety requires that on a road which carries passenger trains at a speed of from 30 to 60 miles per hour, tracks should be maintained at a higher standard than on roads carrying only freight trains at a speed of from 15 to 30 miles per hour. I find that the exigencies of the passenger business on complainant's railroad reasonably call for a passenger train speed 100% greater than the freight train speed reasonably called for by the exigencies of the complainant's freight business, and that a due regard for the safety and comfort of passengers calls for a higher standard of track maintenance on its common tracks than

would be required for the safety of its freight trains on tracks used only for freight traffic.

Whether it would be more profitable to maintain exclusive freight tracks at as high a standard as the common track than to maintain them only at the standard required for the safety of the freight trains is a mixed question of economics and mechanics on which it would be very difficult to form an adequate judgment, and upon which, as already stated, I regard the general practice of railroads as entitled to more weight as evidence than the individual opinions either pro or con of civil engineers.

There was undsputed testimony in the case that on complainant's road there is a loss of power in freight engines due to the super-elevation of curves for the passenger service, which might properly be attributable to the passenger service, in loss of fuel which, in 1912, amounted to $855.

There was undisputed evidence in this case that 2¾% of the time of freight trains on the road is attributable to the delays caused by the preference given to the passenger service to keep the trains in that service on time, as near as may be, and it would follow from this that of the transportation expenses of the year 1912 at least $5,500 which have been allocated to wages paid to freight enginemen and freight train men would more properly be charged to the passenger service. These delays also would cause an extra use of coal in the freight service which would reduce the amount properly assignabe to that service and increase the amount properly assignable to the passenger service by more than $2,000.

There was undisputed evidence that a considerable amount of cost is attributable to the passenger service on account of freight hauled for its use in freight trains,

for which no charge is made. The complainant claims that this item on coal, ties, ballast and rails alone exceeds $3,400 per year.

There are also other expenses charged to the freight service, which, if the amount could be determined, might properly be charged to the passenger service. On the other hand, there are expenses charged to the passenger service which, if the amount could be determined, would be properly chargeable to the freight service.

I find that the weight of the evidence shows that of these indeterminable expenses, the part which would properly be chargeable to the passenger service would exceed the part chargeable to the freight service, but, because they are indeterminable, I cannot use them to increase the known expenses of the passenger service. But my finding as above expressed ought to, and does, somewhat weigh with me in the conclusion announced in the next paragraph.

It is perfectly obvious that a mathematically accurate division of these common expenses of maintenance is not possible; it is only a *fair* division that can be arrived at, and in view of all the facts appearing from the evdence, I find that the modified revenue train mileage basis, which I have adopted for the division of common property, and for the division of the operating expenses of maintenance of way and structures due to weather causes is also a reasonably fair basis for the division of the expense due to mechanical wear, and fairer than any other that has been proposed.

The determination of the proper ratio to be applied to the common items of Maintenance of Way and Structures expenses having been effected, there remains no dispute between the parties as to the proper division of any of the items of expense under this heading.

The same thing is true of all the items of expense under the heading "Maintenance of Equipment".

The same thing is true of all items under "Traffic Expenses," except that the complainant contends that the exepenses of Industrial and Immigration Bureau should be divided on the modified revenue train mile basis, while the defendants insist that it should be divided in the relation to the gross revenue derived from the freight and passenger business respectively. Of the two methods thus proposed, I think the gross revenue basis more fairly reflects the benefits received by the respective services, and I have therefore adopted it. Under Transportation Expenses, there is no dispute except as to the item, Interlockers, Block and Signal Apparatus, Operation, Crossing Flagmen and Gatemen, and Engine House Expenses, Road.

With reference to the first two of these items, defendants contend, if I correctly understand them, that they should be divided in proportion to the freight and passenger yard switching, while the complainant contends that they should be divided on the modified revenue train mile basis. I think that either of these methods would be reasonably fair, but as the expenses covered by these accounts are incurred primarily and principally for the protection of trains, I think that they are more properly assigned upon the modified train mileage basis, and I have, therefore adopted that basis.

Defendants' Objection No. 22 is directed to my conclusion that account number 91, "Crossing Flagmen and Gatemen", can be properly divided on the modified revenue train mile ratio. Defendants claim that these expenses would be more properly divided in the proportion of the freight and passenger yard switching.

Upon reconsideration, I am of the opinion that the

modified revenue train mile ratio is not proper for this division. On the other hand, a division in proportion to the freight and passenger yard switching would assume that flagmen and gatemen were employed only to protect the public against switching operations, an assumption which is certainly not allowable. These expenses were incurred, beyond any question, both for the protection of the public against trains and against switching operations. I have therefore decided to make the division upon a composite ratio obtained by combining the straight revenue train mile ratio with the yard switching ratio. This for 1913 will assign 25.44% to passenger and 74.56% to freight.

The Engine House expenses, the defendants contend, should be divided upon a modified locomotive mileage basis, while the complainant has divided them upon the basis of the engine housings. I am inclined to think that the engine housings more fairly reflect the benefits derived by each service from these expenses, and I have therefore adopted that method.

General Expenses.

The common expenses under this heading I have divided on the basis of the totals resulting from the division of Maintenance of Way and Structures, Maintenance of Equipment, Traffic Expenses, and Transportation Expenses—which seems to me an entirely fair and unobjectionable method.

Under this heading of General Expenses, it is claimed by the defendants that all the expenses of this litigation should be excluded, for the reason that it is an extraordinary expenditure of a kind that is not likely to occur again, and the complainants claim that all such expenses have been excluded in their testimony and exhibits. The

defendants claim, however, that the complainant has not excluded all that should be excluded. On this subject they say:

> "It has not, however, gone far enough. It deducts only the law expenses which are directly charged against this expense. (Delf. R. p. 7751.) It does not deduct for the expenses of time of the auditor and his large force of assistants, who have devoted much of their time to the case, nor does it make any deduction for the valuable services of the president, who has, for a couple of years, devoted almost his entire time to it, nor does it make any allowance for the engineering force, general manager or general superintendent, who have devoted time (R. pp. 3496-7) and we doubt whether there is anything charged against it for special train service, which, upon reading the testimony of Berry, Riggs, Young, Loweth, Cadarette, and others, will be seen to be a large item."
>
> "One dollar per mile for this train service is not more than the company charges for this character of service."

If, by this statement, defendants mean that because the officers and employes of complainant have devoted a portion of their time to this litigation, that therefore a portion of their salaries must be treated as part of the expenses of this litigation, then I hold to the contrary, for the effect would be to assume that the normal expenses of the departments affected were less than they really were.

If, on the other hand, the defendants mean that the expenses of the departments mentioned were in excess of what they would have been in consequence of work done in them in connection with this case, and that the amount of such excess expense has not been excluded from the

complainant's expense account, and if their contention should be found to be correct, the amount of these extra expenses should be so excluded. But the evidence does not show that there was such additional expense. It shows affirmatively that there was no such additional expense not charged to this case in 1912 (Record p. 3496). And as regards the year 1913, there is no testimony on that particular point.

There is nothing in the evidence from which I could find such additional expense, and the amount thereof. Nor is there anything in the evidence from which a deduction could be made on account of salaries of officers who have given time to the case; as the evidence does not show how much of the time of any officer has been given to the case or the amount of his salary.

With reference to the cost of special trains, the testimony does not show that there was any such service; but it shows that if there was any such service in 1912, it was charged up in the expenses incident to this suit.

In the absence of evidence showing that there was special train service which should have been charged to the expenses in this case, and excluded from complainant's general expense account, there is no basis for a deduction to be made by me from complainant's expense accounts. If there were, in fact, any such additional expenses in 1913, which should be but have not been excluded, it is hardly possible that their amount could be great enough to have any perceptible effect upon the case; but if the court should find it essential that the testimony should show whether there was or was not such additional expense in 1913, and the amount of it, if any, I would recommend that the court allow the introduction of further testimony for that purpose.

I have therefore excluded from the expenses for 1912 the sum of $19,083, and for 1913 the sum of $25,690,

those being the amounts which I find from the evidence should be excluded for the purposes of this case, and which figures both parties have used in making these deductions in their statements of operations submitted to me.

The methods adopted for the division of each of the various accounts will be found set forth in Exhibit 6 hereto attached.

Having made this division of expenses between passenger and freight, we arrive at the amount of the total expenses of the complainant's passenger business in Michigan.

Division of Michigan Passenger Operating Expenses Between Intrastate and Interstate.

Certain passenger expenses can be allocated between intra- and interstate. It is agreed between the parties that in general, the remaining expenses can be apportioned on the basis of the respective passenger miles traveled intra- and interstate in Michigan, and all except the following have been so divided:

The passenger proportion of the expenses of the Soo bridge I have assigned entirely to the interstate.

The accounts of Outside Agencies and Advertising, under Traffic Expenses, have been divided on a basis agreed to between counsel.

The accounts Station Employes and Station Supplies and Expenses, I have apportioned between intrastate and interstate passenger on the relation of the number of passengers traveling interstate and intrastate, which seems to me a more proper basis than that of passenger miles. This division might also be made on the relation of the tickets sold at stations, which method would be more favorable to the complainant, but I prefer to divide it on the relation of the number of passengers traveling.

It was contended by the complainant that the cost of carrying on the intrastate passenger business was much greater per passenger mile than in the interstate business, and witnesses in this case testified that the extra expense was from 15% to 25%. It is contended by the defendants that such testimony in this case is subject to the criticism of somewhat similar testimony in the Minnesota rate cases, and I agree with that contention. Although this testimony may be held to sufficiently establish the fact that there is such greater expense, it does not satisfactorily show the amount thereof, and therefore cannot be given effect.

To the foregoing division of passenger operating expenses between inter and intra defendants' objection No. 23 is interposed. In making that division, I understood that counsel had agreed as there stated, but it now appears that I was in error as to the position of defendants' counsel, for the objection claims that I was in error in my division of Michigan passenger expenses between intrastate and interstate on the basis of passengers carried one mile, i. e., in proportion to the number of passenger miles of each class of passengers, and claims that a less proportion of the expenses should be assigned to the intra because of the greater density of intra traffic, on the ground that owing to such density, the cost per passenger mile is less in the intrastate.

By density of traffic is meant the relative volume of traffic over a given section or division of the road as compared to the volume over another section, the density being in proportion to the volume.

It is, of course, true that, other things being equal, and subject to certain limitations, it costs less to transport a passenger a mile when the volume of traffic is large than

when it is small. But it does not follow from this that it costs less to transport an intra passenger than an inter passenger. Such a result could follow, if at all, only in case these two classes of passengers were carried in separate conveyances. Whenever both intra and inter passengers are carried indiscriminately in one and the same train or car, it can no more be said that it costs less per mile to carry an intra passenger than it does to carry an inter, than it can be said that it costs less per mile to carry a white man than a colored man.

Therefore, any decrease in cost per passenger mile that there may be resulting from increased density of traffic on a certain section of the road applies to each passenger equally whether he is inter or intra. Such is the case on complainant's road. The evidence shows that intra and inter passengers are not carried separately but are carried together indiscriminately and on the same trains; that all of complainant's passenger trains connect with roads delivering interstate passenger traffic, and all of them carry both inter and intra passengers. If the number of intra passengers which they carry is greater than the number of inter passengers, that fact does not make the actual cost of carrying one of the former any less than that of carrying one of the latter.

It may be, however, that the defendants' claim here is that although the actual cost of carrying an intra passenger is the same as that of carrying an inter passenger when they are carried on the same train; nevertheless, in a division of costs between the two services, the intra should be charged with less expense per passenger mile, because the additional cost of carrying the excess of intra passenger miles over the inter is not as great per passenger as the cost per passenger mile of carrying the inter passengers and an equal number of intra passengers. In other words, that the cost of carrying all the

inter passengers and of an equal number of intra passengers should be equally divided between the two services, and the intra charged only with the excess cost of carrying the additional number of intra passengers, which would be less per passenger mile. Is there any principle that requires such a division? I do not think so. I do not think that the interstate passenger service can be used in that way to further reduce the cost of the intra service. If there were no inter service, the total cost of the intra service would be much greater than it now is, and the cost per intra passenger mile would be correspondingly greater than in the division that I have made. In the division on the basis of passenger miles in the two services, each service gets the benefit of working in conjunction with the other, and that is all the benefit that either is entitled to.

Such a division as defendants here contend for would seem to be an unwarranted discrimination against interstate traffic in favor of the intra, and a placing of a burden upon the former for the benefit of the latter.

The problem is to make a proper division between the intra- and interstate services of the expenses incurred in rendering the combined services. Those expenses are incurred for both services combined, and they should be borne by each in proportion to the extent to which each service avails itself of the facilities paid for by these expenses. Is this extent properly measured by the number of miles that a passenger is carried in each service? It seems to me that it is, and I am unable to see how it can be as properly measured in any other way.

Defendants also object to my apportionment of the accounts "Station Employes" and "Station Supplies and Expenses". (Objection No. 24.)

This objection is that the expenses of station employes, supplies, and the other stational expenses should

be divided between inter and intra on the basis of the number of miles traveled by the passengers in each class rather than on that of the number of passengers in each class. As between these two methods of division, the one chosen should, of course, be that which best reflects the extent of the use of the stational facilities made by each class. That this is so there would seem to be no room for question; and if this is so, there would, in like manner, seem to be no room for question that, as between these two bases of division, that of the number of passengers should be chosen. Practically every passenger in each class uses the stational facilities for every journey, and the use which he makes of them is practically the same, regardless of the length of his journey. If he rides only ten miles, his use of the stational privileges is the same as though he rode 100 miles or any other distance. It would seem clear, therefore, that a division on the basis of miles traveled, whatever else may be said of it, would not reflect, except in very distorted fashion, the actual use of the stational facilities by the two classes of passengers. In such division the use made by a passenger riding 100 miles would, as reflected in the division, be ten times as great as that of a passenger riding ten miles, when in fact the use would be the same. At all events, there is nothing in the fact that a passenger rides 100 miles which would tend to show that he makes any greater use of the stational facilities than a passenger who rides 10 miles.

As these stational facilities are provided for the use of passengers, and as they are available equally to both of the classes of passengers in question, and as all passengers in either class presumably make the same use of them, I can see no objection to dividing the expense of operating them on the basis of the number of passengers using them. And especially can I see no reason for

objecting to it as unfair to the intra passengers, because it is altogether certain that the average use of an intra passenger is greater than that of an inter passenger, because a large proportion of the intra passengers are local passengers, each of whom uses the stational facilities twice in connection with each journey, whereas the greater portion of the interstate passengers use them only once in each journey.

I am satisfied that these stational expenses should be divided on the basis of the number of passengers, rather than on that of miles traveled by the passengers in each class.

Division of Taxes.

It is agreed by both parties that taxes should be apportioned between the services, passenger and freight, respectively, and between intrastate and interstate passenger and freight, respectively, in proportion to the respective valuations, first deducting the proportionate amount of taxes on the Michigan property assigned to Wisconsin. To do this properly, there must be excluded from the valuation the value of the property owned by corporations other than the complainant, because these other corporations pay their own taxes, and the share thereof which falls on complainant is included in its expenses. Therefore, before determining the proportion, I have excluded all the property in Schedule 34, "Ferries and Steamships", and in Schedule 36, "Terminals", being all the property of the Mackinac Transportation Company, the Saint Marie Union Depot Company and the New Jersey Bridge Construction Company included in my valuations.

Probable Earnings Under the Two-Cent Rate.

Having found the amount of net earnings in a typical year under the 3¢ rate, it remains to estimate therefrom what the annual net earnings will amount to under the 2¢ rate.

On this question, the complainant claims that the earnings to be expected under the 2¢ rate will be found by reducing to 2¢ per mile all the fares in excess of that rate charged under the 3¢ rate in the typical year.

The defendants admit, of course, that such reduction in the revenue realized from the passenger miles shown in the typical year will result from the reduction in rate, but deny that the total of passenger earnings will be thus reduced. They claim that the reduction in rate has two distinct and different effects, both of which must be considered; that while the reduction in rate causes a decrease in passenger earnings in one way, in another way it causes an increase in earnings by causing a large increase in passenger traffic—an increase so great that the total net earnings under the 2¢ rate will be substantially as great as under the 3¢ rate. This claim of the defendants, if sustained, would put an end to the case. If it is a fact that the prescribed rate will cause no loss in revenue, there is, of course, no ground for this suit. Is it a fact? The defendants offer no proof in support of this allegation. Instead of undertaking to prove the allegation to be true, they contend that it devolves on the complainant to prove that it is not true; and in support of this contention, they invoke again the presumption in favor of the validity of legislative enactments and claim that by virtue of that presumption, the burden is on the complainant not only to prove every allegation necessary to show prima facie that the statute is confiscatory, but also to disprove every counter allegation which, if true, would render the statute non-confiscatory,

or create a reasonable doubt of its being confiscatory; that the reduction in rate will, of a certainty, cause some increase in traffic, and that the statute cannot be held confiscatory until it is shown affirmatively that that increase will not be sufficient to overcome the loss caused by the reduction, or sufficient to cause a reasonable doubt in that regard.

This claim assumes that there is a legal presumption that the reduction in rate will cause an increase in traffic sufficient to overcome the loss caused by the reduction in rate, or at least sufficient to raise a reasonable doubt that the loss so caused will not be thus offset to such an extent as to save the statute from being confiscatory, and that the complainant must overcome this presumption by proof to the contrary. To be more specific, the claim assumes that if the complainant proves that the net earnings from the total passenger miles of the typical year would, under the 2¢ rate, be insufficient to yield a fair return on the property employed, the presumption in favor of the statute is not thereby overcome, because there still remains a presumption that the decrease in rate will cause an increase in traffic that will increase the earnings, and that the statute must be held constitutional until it is affirmatively shown that such increase in earnings will not be sufficient to bring the total net earnings up to an amount that would constitute a fair return upon the property employed, or sufficient to create a reasonable doubt of its insufficiency in that regard. Is there such a presumption arising from the presumption in favor of the statute? If so, the complainant's case must fail, for in order to prove that the increased traffic will not be sufficient to have that effect, it is necessary to prove what that increase of traffic will amount to, and to do that is impossible. Assuming that there will be some increase in traffic, there is no ground whatever on

which to form a rational estimate of what that increase will amount to. Any attempt to make such estimate would be guess work of the vaguest kind.

Does the law indulge such presumption and thereby impose this impossible burden of proof? I find that it does not; that the presumption in favor of the statute is not of such character as to produce this result. That presumption is itself founded, as we have seen, on a presumption that the legislature has judged the precise question involved and judged it correctly on satisfactory evidence. This being so, the presumption in favor of the statute can extend only to such questions as could have been judged by the legislature, and cannot extend to questions that could not have been so judged. In other words, a question of fact which, from its nature is not susceptible of proof, and is therefore beyond the power of the courts to determine, is also beyond the power of the legislature to determine, and cannot therefore be assumed to have been legislatively determined. I find that the question as to the amount of increased traffic to be anticipated from the reduction in rates is such a question, and that there can therefore be no presumption that the legislature adjudged it and found that the increase in traffic caused by the reduction in rates would be sufficient to overcome the loss in earnings resulting from the same cause; and therefore that the complainant is not required to prove the amount of the increase in traffic.

This, however, does not relieve the complainant from meeting the question presented by this possible increase in traffic. The burden of proof is still on them to prove the unconstitutionality of the statute beyond a reasonable doubt, and it therefore is necessary to meet the question whether there is such a possibility of increase in

traffic, and if so, whether it is sufficient to create such reasonable doubt.

Upon this question, I find that there is not only a possibility, but a very strong probability, that there will be some increase in traffic—that there will be a greater number of passengers carried and a greater number of passenger miles made under a 2¢ rate than there would be under the 3¢ rate. I find, also, that it is wholly impossible to make any rational estimate in actual figures of the amount of that probable increase, but that it is morally certain that the increase will be comparatively small, for the reason that the increase will be only in local travel for pleasure and in a region so sparsely settled as that which is tributary to the complainant's road, only a small increase in such traffic can reasonably be expected. This view of the probable increase finds confirmation in the experience of the company during the twelve years preceding the year 1914. According to the accounts for those years which are in evidence, the number of passenger miles per annum increased during that period approximately 20%—from 27 millions plus in 1902 to 33 millions plus in 1913. At about the middle of that period, viz: in September, 1907, there was a reduction in rate from 4¢ per mile to 3¢.

On the defendants' theory that a reduction in rate will result in a corresponding increase in volume of traffic, this reduction of 25% in rate in 1907 should have been followed by an increase in passenger miles in 1908 sufficient to overcome the loss, which increase, it would seem, would have to be at least 33⅓%, but instead it was followed by a decrease of a trifle under 3% in that year, and in the succeeding year, 1909, it was followed by another decrease of a trifle over 3%. Since 1909, the passenger mileage has fluctuated somewhat, but has not approached the 1907 mileage until 1913, when it came

a little within 100,000 miles of the latter. The mileage for 1907 was, for the fiscal year ending June 30, 1907,—three months before the reduction in rate took effect, so that the large mileage of that year was wholly under the 4¢ rate and the mileage of 1908 was three-fourths under the 3¢ rate. This experience, of course, does not prove that a decrease in mileage is to be expected from a reduction in rates. But it very strongly confirms the above conclusion that the probable increase of traffic to be expected from the rate reduction in this case is small and very uncertain in amount.

My conclusion is that the possible increase in traffic which may result from the decrease in rate is too small and uncertain and too much a matter of mere speculation to be allowed to be made the basis of any calculations. and that in estimating the results of future operations, it must be assumed that the probable earnings to be expected under the 2¢ rate will be found by applying to the passenger mileage of a typical year the 2¢ rate to the whole fare mileage, and 1¢ rate to the half fare mileage, and the 3¢ rate to the mileage of passengers who travel only five miles or less, as those are the rates provided in the act complained of.

The conclusion here reached seems to be fully supported by the cases of Chicago & N. W. R. R. vs. Dey, 35 Fed. 866-81, and Re Arkansas Rate Cases (St. L. & S. W. Ry. vs. Allen), 187 Fed. 390.

In the former case, the Court, per Mr. Justice Brewer, says:

> "It is said that it cannot be determined in advance what the effect of the reduction of rates will be. Oftentimes it increases business, and who can say that it will not, in the present case, so increase the volume of business as to make it remunerative, even more so than at present. But speculations as to the

future are not guides for judicial actions; courts determine rights upon existing facts. Of course, there is always a possibility of the future; good crops may increase transportation business; poor crops reduce; high or low rates may likewise affect; but the only fair judicial test is to apply the rates to the business that has been done in the past and see whether upon that basis such rates will be remunerative, or compel the transportation of business at a loss."

In the latter case, this language is quoted and the principle enunciated is applied.

To my determinations under the heading, "Probable Earnings under the Two-Cent Rate", defendants' Objection No. 26 is directed. There are six different grounds, designated (a), (b), (c), (d), (e) and (f), as follows:

(a) That there is no proof that there will be any loss.

If this means anything different from what is meant by specification (d), then the answer to it is that it is not only proved, but it is undisputed and unquestionable that there will be a loss on every passenger mile made under the reduced rate. If it means that there is no proof that this loss will not be overcome by increased traffic resulting from the reduction in rate, it is identical with specification (d).

(b) That "there is no basis for a conclusion that increased traffic will not result from the decreased rate."

The assumption here involved that I found or drew a conclusion that increased traffic would not result from the decreased rate is erroneous. I neither drew such conclusion or made such finding. On the contrary, I

found that in all probability some increase in traffic would so result.

(c) That "said rate never having been put into operation, there is no experience or basis on which to estimate loss due to putting it into effect."

This is simply another form of the proposition that no rate can be enjoined or contested unless and until it has been put into operation, and kept in operation for an indefinite period long enough to demonstrate by experience what the actual loss will be.

If this proposition is sound, this case would never have proceeded farther than the motion for a preliminary injunction, as the court would have held then and there that the suit was prematurely brought and could not be maintained until the rate had been tested by experience. The proposition need not, therefore, be discussed here.

(d) That "there is no testimony that increased traffic due to the decreased rate will not so increase the volume of traffic carried that there will be no loss."

The question whether it devolves upon complainant to prove this negative was so fully discussed in connection with my findings that no further discussion seems to be called for here.

(e) That "the presumption that increased traffic due to the decreased rate will be sufficient to overcome, in whole or in part, the loss in revenue per passenger per mile due to the decreased rates has not been overcome."

I know of no such presumption as is here assumed to exist. This is the same as specification (d), except that it is stated in another form. It assumes the existence of a presumption that would cast upon the complainant the impossible burden of proving what increase of revenue would arise from increase of traffic resulting from the decrease in rates. That there is no such presumption

seems to be recognized by defendants in argument under this objection when they say, "to allow complainant as loss the full difference between the amounts produced by the old rates and amounts which would be produced by the new rates is to disregard the experience, which amounts almost to a presumption, that traffic will increase." This specification is the same in substance as (c) and (d), but stated in another form.

(f) That "the conclusion that the reduction in rate of 1907 did not result in increased traffic is unsupported by the evidence, and the proper conclusion therefrom is that an increase did result from such reduction."

The assumption here made that I made a finding or drew a conclusion that the reduction in rate in 1907 did not increase traffic is incorrect. On that subject I made no findings but merely gave the undisputed figures shown in the testimony (which speak for themselves) as tending to confirm the conclusion thereinbefore drawn, that the probable increase of traffic to be expected from the rate reduction in this case is small and very uncertain.

Defendants argue at considerable length under this objection in support of their contention that no rate can be enjoined or its validity tested until its effect has been proven by actual experience gained by putting it into operation for such length of time as will be sufficient for that purpose, but the authorities cited do not, in my judgment, sustain that position, and it seems to me clear upon principle that no such general doctrine can be held.

In arguing it, defendants entirely disregard the fact that the question of the amount of increased traffic in any case, arising from a reduction in rates, will depend upon the special conditions of the particular road in question.

Those conditions might be such as to render a large

increase probable, or they might be such as to render any considerable increase very improbable or even impossible. In order that there can be an increase there must be in the territory served by the road what may be called potential traffic, waiting to be developed into actual traffic by a reduction in rates. In this case there is, in my judgment, no such potential traffic as could possibly be expected to develop into sufficient actual traffic to overcome the loss, or to overcome any material portion of it. This conclusion is drawn from the testimony in the case, and is based upon the sparsity of the population and its location or distribution in the territory traversed by the road; and the conclusion is strongly confirmed by the effect of the reduction in rates in 1907, which effect is shown by the evidence in this case and from which it appears clearly that there was not, at the time of that reduction, any appreciable amount of potential traffic capable of being developed into actual traffic by a reduction in rates.

It appears from the evidence that in each of the three years following 1910 there was an increase in the number of intrastate passenger miles over those in the preceding year, so that the number of intrastate passenger miles made in 1913 was 15% greater than those made in 1910.

As to the cause of this increase there is no direct and positive evidence. The defendants claim that it was an increase in intrastate traffic proper and was due, in the main, to the decrease in the rate made in 1907, and that it proves their contention that the decrease in rates will produce a considerable increase in traffic. But the complainant claims that it was not a genuine or legitimate increase in the volume of intrastate traffic proper, but a fictitious or borrowed increase, drawn from the interstate traffic by the opportunity afforded by the refund receipts for interstate passengers to obtain a lower fare

by purchasing and using intrastate tickets wherever practicable. In support of this contention they cite the fact, also shown by the evidence, that contemporaneously with this increase of 15% in intrastate passenger miles there was a decrease in interstate passenger miles of 21%.

Each of these opposing theories attributes the increase in intrastate passenger miles to the decrease in rates, the difference between them being as to the class of travelers from which the increase is drawn. If, as claimed by complainant, it was drawn from the interstate traffic, it was not a benefit to complainant, but a distinct injury; and it would be a kind of grim irony to charge it up to them as a benefit derived from the decrease in rates.

The question whether this increase in intrastate passenger mileage was made by passengers whose entire journey was intrastate or was, in whole or in part, by passengers whose journey was in fact interstate, but performed in part on intrastate tickets, is one upon which there is no direct testimony and which, therefore, must be decided on probabilities. Which theory as to the origin of this increase is most in accordance with the probabilities? The fact that the increase in intrastate passenger miles was accompanied by a decrease in interstate passenger miles of an amount that corresponds so nearly with the increase in intrastate passenger miles,—the former being 3,040,272 and the latter 3,385,863 passenger miles,—creates a very strong probability that the increase in the intra came from the inter. And this probability is much strengthened by a consideration of the relative strength of the appeal to the two classes of travelers made by the decrease in the rate. It is evident that the inter passenger is much more likely to be induced to use the lower rate on a journey which he is going to take in any event, than that the general public would be in-

duced by it to take an intrastate journey which they would not otherwise take.

My conclusion from the evidence is that the increase in intrastate traffic in question is not a real increase in such traffic, but an increase derived in the main from an addition to the intra passenger mileage made by interstate passengers on intra tickets. The correctness of this conclusion I find to be strongly supported by the cases to which I have been referred by complainant's counsel, among which I mention particularly the following: Corporation Commission of Oklahoma vs. A. T. & S. F. Ry., 31 I. C. C. Reports, 537; Arkansas Rate Cases, 187 Fed. 290; and Boyle vs. St. L. & S. F. Ry. Co., 222 Fed. 539. These cases show that wherever tests have been made it has been found that where there has been a reduction in intrastate rates, without a corresponding reduction in interstate rates, the result was to increase the intrastate travel, but only at the expense of the interstate travel, and that the real increase in intrastate travel, caused by the reduction of the rate, has been negligible. As was said by the court in the last named case:

> "On the part of the State it is contended that the reduced rate of two cents a mile would stimulate that traffic to such an extent that the intrastate business would be the gainer, or at least not a loser. For the interstate passenger business the company charged three cents, and in order to ascertain what the effect on that claim is, a test was made for the month of August, 1913, which, it is claimed, shows that while it increased the intrastate business, it did it at the expense of the interstate business. (The two cent rate went into effect on this road in July, 1913.) In order to get the exact factors, train auditors and collectors were, after the two cent rate was put in effect, put upon all trains crossing the borders of the state,

with instructions to make a detailed check of all passengers who bought tickets or paid fares on the train at the boundary stations of the state. These reports show that there was an abnormal increase in the purchase of tickets at those boundary stations. * * *

"From the evidence the court finds as a fact that the two cents rate does not stimulate passenger traffic, except at the expense of the interstate. People are not in the habit of traveling merely because rates are lower. It is probably different when special reduced rates are made for certain occasions, but in such cases it is the special occasion which causes it."

Before concluding the consideration of this subject, I desire to make my ruling and its effect so clear as to leave no room for doubt or misunderstanding, and this can best be accomplished by correcting a misunderstanding of it which the defendants evidently have.

In argument under this objection on page 45 of their objections, they say:

"The result of the Master's ruling is to deny the test of experience or the necessity therefor. The result of the rulings in the deciding cases is that where there is an appreciable return, as there is in this case, upon the Master's computation, the test of experience will be required."

The result of these two statements is an assertion that my ruling on this subject is in direct conflict with the decided cases, and if both statements are correct, there would be such conflict; but in my view, neither of them is correct.

As regards the rulings in the decided cases, if it is true, as stated by defendants, that the decided cases hold that wherever the evidence shows that there will be "an ap-

preciable return" (which means any return at all over and above operating expenses), the courts will require the test of experience under the new rate before passing upon the validity of the rate, then my ruling is in conflict with the cases and must be modified accordingly. But I do not so understand the cases. I know of no case where this doctrine has been held. As I understand the cases, the result of them is, not that the courts will refuse relief and require a test of the rate whenever it appears that there will be an appreciable return, but that they will or will not require such test before acting in any case according as it may seem to them most proper in view of all the probabilities of the case. The fact that the evidence shows that some return is to be expected under the new rate is, of course, an important element to be considered in estimating these probabilities, but it is the size of that return, and not the mere fact that there will be some return, that is important. Given the amount of the return that the evidence thus shows is to be expected, notwithstanding the reduction in rates, the question is whether that amount will be sufficient either in itself or taken together with some augmentation to be reasonably expected to result from the reduction in rates. If it is sufficient in itself, that ends the matter; if it is insufficient in itself, then it remains to determine the probabilites as to whether that insufficiency will be overcome by increase in traffic. And those probabilities will depend upon the amount of the deficiency and the prospects of increased traffic, judging from all the conditions of the business as regards past experience, density of traffic, sparsity of population, competition, etc., etc. These considerations might be such as to call for a suspension of judgment until the rate is tested, or they might not. The insufficiency might be so small, and the prospects of increased traffic so great, that no actual test would be deemed neces-

sary in order to reach the conclusion that the rate was not confiscatory; and on the other hand, the insufficiency might be so great, and the prespects of increased traffic so small and remote, that no actual test would be deemed necessary in order to reach the conclusion that the rate was confiscatory; and again the insufficiency and the prospect of increase taken together might be such as to leave the question in such doubt that an actual test would be deemed desirable before coming to a final decision.

It was on this understanding of the law that my ruling was made. Proceeding on such understanding of the law, and applying it to this case, the question is, Into which of these three classes of cases does this case fall?

On this question it certainly cannot be claimed that it falls within the first,—that the insufficiency is so small and the prospects of increased traffic so great as to justify the conclusion that there will be no loss. The only question, therefore, is whether it falls within the second or the third class. My ruling is that it falls within the second class,—that the insufficiency is so great and the prospects of resultant increased traffic so small that it is in this case unnecessary to put the rate to actual test before reaching the conclusion that it would, if enforced, be confiscatory.

If I am wrong in this conclusion, then the case, in my judgment, necessarily falls within the third class, and a test of the rate should be required before final decision.

In that case I assume that the court would not at present make any final disposition of the case, but would order that the test be made and retain jurisdiction of the case until the test had been completed and the results shown; and then decree accordingly.

By their objection No. 29, the defendants claim that I was in error in refusing to permit the introduction of, or to consider, the report showing passenger earnings for the fiscal year 1914.

In this objection defendants are mistaken as to the facts. The record shows that no such report was ever offered in evidence. The defendants' counsel reserved the right to apply to the Master or the court for leave to go into the matter of the passenger accounts of the complainant for the year 1914. No application for such leave has since been made to me; and if such application were now made, I am unable to see how it could consistently be granted without including also the fiscal years 1915 and 1916, which have now been completed, or to see how they could be used for any purpose, since 1913 is to be taken as a typical year and is the only year for which property values have been determined. (See Record pp. 10,716-8.)

Complainant's Freight Business.

The testimony in this case was all taken and the argument completed before the decisions by the Supreme Court of the United States in Norfolk & Western Ry. Co. v. Conley, and Northern Pacific Ry. Co. v. North Dakota. Afterwards, I requested counsel to state what matters that had been litigated in this case were affected by these decisions. Complainant took the position that the effect of the decisions is:

(a) To render it unnecessary for the Master to make any division of freight revenues or expenses between the inter and intra business.

(b) To render it unnecessary to make any division of exclusive freight property between the inter and intra business.

(c) To render it unnecessary to determine any property values, revenues or expenses, attributable to the ore business as separate from other freight business, inter or intra.

(d) That it will be necessary to value the entire property in Michigan, and to determine the entire revenues and expenses in Michigan.

(e) The opinions do not affect in any way the necessity of valuing the exclusive passenger property and dividing it between inter and intra; nor the valuing of the property used in common in the freight and passenger service; the dividing of it between passenger and freight; and the dividing of the passenger proportion between inter and intra. Nor do they affect in any way the necessity of making like determinations and divisions of expenses between freight and passenger, and of the passenger proportion thereof between inter and intra. Nor do they affect in any way the necessity of ascertaining the freight and passenger revenues, respectively, and as to the passenger revenues, the inter and intra amounts thereof.

Defendants agreed with complainant as to "d" and "e" but were of the opinion that "a", "b" and "c" were matters which I should cover in my findings and report. I therefore proceed to cover all of the freight matters thus called for and not hereinbefore discussed.

Division of Michigan Freight Property Between the Intra- and Interstate Business.

The value of the complainant's Michigan freight property is shown in Exhibit 1 hereof, wherein I have found the value of the complainant's entire property in Michigan and also the portion thereof used in its passenger

business, the value of the freight property being the balance of all the property valued by me in Michigan.

The paries are agreed that division of this freight property between the intra- and interstate business should be upon the proportion which the Michigan freight ton miles in the intrastate and interstate business, respectively, bear to the total Michigan freight ton miles.

The records of the company prior to 1912 were not so kept as to show the division of the freight ton miles between intra and inter, but they were so kept as to give these figures for the years 1912 and 1913, and it is my judgment that the use of the average of these two years will express a more stable relation than the use of the mileage of any one year, and I have therefore taken this average, by which I arrive at a division which assigns 26.48% to the intrastate and 73.52% to the interstate.

Before applying these percentages, I have deducted the freight proportion of the value of the so-called Soo Bridge, and assigned it entirely to the interstate business, and I have also assigned to the interstate business the value of the Marquette ore docks.

Attached hereto, marked "Exhibit 8", is a summary of the division of the freight property in accordance with this method.

Division of Michigan Freight Revenues Between the Intra- and Interstate Business.

The Michigan passenger revenues I have already determined. The balance of the Michigan revenues are freight.

All revenues for carrying freight, which constitute the bulk of the freight revenues of the complainant, have been allocated as between the intrastate and interstate business. Those revenues which could not be so allocated have been apportioned between the intrastate and inter-

state business on the basis of the allocated revenues. There is no disagreement between the parties as to this being a correct method.

Division of Michigan Freight Operating Expenses Between the Intra- and Interstate Business.

The passenger operating expenses of complainant having already been determined, the remainder of the operating expenses are assignable to freight, and it is only necessary to divide such freight expenses between the intrastate and interstate business in Michigan.

It is contended by the complainant that the cost of doing the intrastate freight business is much greater per ton mile than the cost of doing the interstate freight business. Witnesses in this case testified that the expense per ton mile was at least twice as great in the intra as in the inter. It is contended that this testimony is not subject to the criticism of somewhat similar testimony in the Minnesota Rate Cases. I am not able to agree with this contention.

I think that the fact is established by the testimony that there is a greater expense, but the amount of it is not by such opinion testimony satisfactorily established.

But the complainant claims that even if the haulage cost in the two services is the same per ton mile, nevertheless terminal and stational expenses cannot be properly divided on the relation of the freight ton miles made in the intra- and interstate services, respectively, but should be divided in proportion to the tons handled in the stations and terminals.

It seems to me that in this contention complainant is correct. The cost of assembling and delivering freight in stations and terminals has no relation to the miles over which such freight is carried.

If, then, the terminal and stational expenses can be de-

termined with reasonable accuracy, it follows that they should be divided between the intra- and interstate business in proportion to the number of tons handled at stations and terminals. The complainant claims that such cost can be ascertained.

In general outline, the method of making the proof was as follows:

Complainant does a considerable amount of iron ore business in the haulage of ore from mines to ore docks at Marquette, from which docks the ore is loaded into vessels. This business is entirely interstate. The freight operating expenses for the fiscal years 1912 and 1913 were first separated so as to show with approximate accuracy the expenses chargeable to the transportation of to these docks and those chargeable to transportation of other freight which is in part intrastate and in part interstate business.

The operating expenses of the other freight business for the years 1912 and 1913 were then analyzed so as to show the stational and terminal expenses included therein, viz, the expenses arising from services performed in originating and delivering freight at stations on the road in Michigan, and in receiving and delivering freight interchanged with other carriers at Michigan junction points.

These stational and terminal expenses consist of the entire amount of yard expenses and the station expenses attributable to the freight business under the general heading "Transportation Expenses", and of sections of certain other expenses as follows:

It was proved, and is undisputed in the case, that 39.01% of the time of all freight trains passing over complainant's road was spent at stations between terminals, during which time they were engaged in switching operations or doing other stational work. From this it

may fairly be inferred that 39.01% of the following expenses of road freight trains under the general heading "Transportation Expenses" is chargeable to stational or terminal service, viz: "Engine House Expense—Road", "Fuel for Road Locomotives", "Water for Road Locomotives", "Lubricants for Road Locomotives", "Other Supplies for Road Locomotives", "Road Engine Men", "Road Train Men", and "Train Supplies and Expenses".

For the same reason, 39.01 of the following expenses under "Maintenance of Equipment" is chargeable to stational or terminal service: "Superintendence", "Steam Locomotives—Repairs", "Steam Locomotives—Renewals", "Steam Locomotives—Depreciation", "Freight Train Cars—Repairs", "Freight Train Cars—Renewals", and "Freight Train Cars—Depreciation".

The total of these stational and terminal expenses thus determined aggregated in 1912 $405,365, and in 1913 $469,405.

The evidence shows that the movement of all freight traffic in 1913, other than ore to docks, was analyzed, and the number of tons of intrastate freight and the number of tons of interstate freight interchanged with other carriers at Michigan junctions ascertained. There was also ascertained the number of tons of intrastate freight, and the number of tons of interstate freight originated at Michigan stations, and the number of tons of intrastate freight and the number of tons of interstate freight delivered at Michigan stations.

It was shown that in 1912 and 1913 more than 95% of all freight traffic in Michigan (other than ore) was transported in car-loads.

It was shown by the undisputed testimony that the stational or terminal service performed in interchanging carload freight with other carriers at junctions is much

less per car than that performed in originating or delivering it at stations on the line of the road, and that on the average it was not more than one-fourth of the latter.

Accordingly, the number of tons of interstate freight received from connecting lines at Michigan junctions, and the number of tons of intrastate freight delivered to connecting lines at Michigan junctions, was multiplied by one-fourth, as such freight received one-fourth terminal service at the junction.

The number of tons of intrastate freight that originated at Michigan stations on the line, and the number of tons of intrastate freight delivered at Michigan stations on the line, was multiplied by one, as such freight received one terminal service.

The total of those products of intrastate business amounts to 1,424,952 and indicates the volume of stational or terminal service given in Michigan to intrastate freight.

Exactly similar computations were made on the interstate freight business, and the total arrived at, viz, 1,159,939, indicates the volume of stational or terminal service given in Michigan to interstate freight.

The volume of terminal service to intrastate freight 1,424,952 equals 55.3%

The volume of terminal service to interstate freight 1,159,939 equals 44.7%

We thus arrive at the percentages which should be applied in the division between the intra- and interstate freight service in Michigan of the stational or terminal expenses for the years 1912 and 1913, respectively, hereinbefore stated.

1912	55.3%	of	$405,365	=	$224,167 intrastate
	44.7%	of	405,365	=	181,198 interstate
1913	55.3%	of	469,405	=	259,581 intrastate
	44.7%	of	469,405	=	209,824 interstate

All the other freight expenses (i. e., all expenses except stational expenses and general expenses), viz, $672,404 in 1912, and $755,707 in 1913, I have divided between the intrastate and interstate business in the proportion that the intrastate ton miles and the interstate ton miles bear to the total ton miles in each of the years, respectively.

The "General Expenses", which amounted to $51,171 in 1912, and to $50,335 in 1913, I have divided between the intrastate and interstate business on the basis of the totals resulting from the division of all other freight expenses as hereinbefore described.

There is no dispute between the parties as to the division of freight expenses except in the matter of the terminal or stational expenses and the "General Expenses". These stational and general expenses I have divided in the manner above described as being the most equitable method of division.

1912 Freight Operating Expense.

	Total	Intrastate	Interstate
Freight other than ore to Marquette Docks	$1,129,334	$434,902	$694,431
Ore to Marquette Docks	246,346		246,346
Total 1912	$1,375,680	$434,903	$940,777

1913 Freight Operating Expense.

	Total	Intrastate	Interstate
Freight other than ore to Marquette Docks	$1,276,037	$509,026	$767,011
Ore to Marquette Docks	210,030		210,030
Total 1913	$1,486,067	$509,026	$977,041

It is claimed by the defendants that the testimony upon which I base my finding as to the average stational service

given a ton of freight in the interchange thereof with another railroad consists entirely of opinion testimony, and that opinion testimony does not furnish a sufficient basis for such a finding.

The finding, however, is based only in part on opinion testimony as hereinafter explained, and such opinion testimony was not of the same character as that which was criticized in the Minnesota Rate Cases. The opinion evidence on this point in this case was from employes of the complainant thoroughly familiar with its method of interchanging freight, and of the amount of service required therein. It was shown further, undisputed in the case, that in general such interchange was made in loaded cars placed on delivery tracks conveniently arranged so that little expense was involved in either putting the car onto the exchange track or taking it therefrom.

It was further shown that the complainant, in receiving freight at stations on its line, is compelled in general, first, to spot cars to be loaded, often at industries considerably distant from its main line, then, when the cars are loaded, haul the cars to its main line; and that in delivering freight, the service is the same with the process reversed.

It was further shown in the evidence that at junction points usually several cars at a time, amounting at some junctions to more than 500 cars a week, are interchanged, whereas in the delivery or receipt of freight at stations on the line, the deliveries are in fewer car lots, there being over 200 stations on the road in Michigan where freight is originated and delivered as against only 12 junction points where freight is interchanged. The fact that the interchange business involves less stational service than is involved in originating and delivering freight at statons is proved by undisputed evidence; the amount of this excess is shown only by opinion evidence. From

this opinion evidence I find that the relative service on this interchange business does not exceed one-fourth of the service that is performed in originating or delivering freight at stations on the line of the road. The results of this division are as above shown.

If, however, the court should be of the opinion that I am wrong in giving weight to this opinion testimony of employes, based on actual experience, a division of terminal and stational expenses can be made upon the assumption that interchange freight receives the same terminal or stational service per car as all other freight.

In that event, the division of the operating expenses between intra and inter will be as follows:

1912 Freight Operating Expenses.

	Total	Intrastate	Interstate
Freight other than ore to Marquette Docks	$1,129,334	$393,122	$736,212
Ore to Marquette Docks	246,346		246,346
Total 1912	$1,375,680	$393,122	$982,558

1913 Freight Operating Expenses.

	Total	Intrastate	Interstate
Freight other than ore to Marquette Docks	$1,276,037	$460,930	$815,107
Ore to Marquette Docks	210,030		210,030
Total, 1913	$1,486,067	$460,930	$1,025,137

The percentages which I have used for the division of stational and terminal expenses are derived from carload freight. This I consider sufficiently accurate, as this is, as I have already stated, more than 95% of the entire freight.

The complainant also made an analysis of the less than carload freight in Michigan (see Complt's Ex. 87, Delf) for the year 1913, which shows that the proportion of such service given to the intrastate business is more than the proportion derived from the carload freight, but as the amount of less than carload freight is very small, I have disregarded this difference and used here only the proportions arrived at from the carload business.

The detail for the division of terminal expenses is to be found in complainant's Exhibits 74 to 80, inclusive, Delf.

The Rate of Return to which Complainants are Entitled.

Having found the value of the property employed, and the rate of return upon that value that is to be expected under the two-cent rate, we come to the third and final main question, viz: Is that rate sufficient to constitute the fair return to which the complainants are entitled under the Constitution?

As this question depends upon what rate of return it is that the company is entitled to, I will proceed to consider the latter question as the proper method of determining the former.

In some instances, it is possible and practicable to determine the former question without determining the latter; for example, it may be found that a return of 2½% is insufficient without finding exactly what percent is required in order to afford a fair return; but such finding would not be a complete finding in any case; and when made in the report of a Master, it is also insufficient. It is there insufficient because the Master's finding as to what rate of return is to be expected is subject to review, and to a change which would raise a new question as to the sufficiency of the expected rate and

thereby render immaterial his finding as to the sufficiency of the rate found by him to be expected; and it would be incomplete because it is impossible to say, with any proper degree of certainty, that any given rate is insufficient without adopting and applying a criterion by which to judge such sufficiency; and when such criterion is adopted and fully applied, the rate to which the company is entitled is necessarily thereby determined.

It is evident, therefore, that the determination of the proper rate of return is as clearly a part of the duty of the Master as the determination of any other question in the case, and I shall therefore proceed to determine that question.

For the determination of that question, we have already provided the true criterion of judgment, so that it is here only necessary to apply that criterion, the same being found in the findings of law made by me in the beginning of this report at the request of the defendants, as follows, viz:

> "The rate of return to which a property is entitled is ordinarily that at which capital will seek investment in properties of similar character in that community or locality."

This enunciation of doctrine is also accepted by complainant and there seem to be no room for question that it is, both on economic and on equitable principles, the true and only true criterion by which to judge the fairness of a rate of return. It gives to the public the service at as low a rate as they could obtain it in the open market if the service were a commodity obtainable in the open market, and at the same time, it does not take an undue advantage of the company by compelling them to render the service for less than it is fairly worth when considered as a marketable commodity. Inasmuch as it

is accepted by both parties, the only question regarding it which can arise here is as to the correctness of its application.

Proceeding now to make such application, we find, curiously enough that, although proposed by one party and accepted by he other, it has not been directly applied by either.

In the briefs filed, the complainants claim that the fair rate of return to which they are entitled is eight percent (8%) and they base their claim upon the ground of general equity, but they do not claim, unless by implied inference, that that rate is equitable because it is the minimum rate at which capital would seek investment in this or similar property; and the defendants make various claims on various grounds with no reference to the criterion in question and no apparent relation thereto. As stated in their brief, the complainants' claim is as follows: that

> "under all the circumstances, considering the nature and extent of the traffic, the character and efficiency of the service, winter and other unusually hard operating conditions, the value of the property devoted to the public use, the results of its entire railroad operations for the last twenty-seven years, and further taking into account, inter alia, the possibility of loss of its ore and other business, the exhaustion of forest products and the water and all rail interstate and intrastate commercial and competitive conditions it encounters and the actual lack of substantial increase in the volume of both intrastate and interstate passenger busines as the years roll by, the complainant is entitled to earn net not less than eight percentum (8%) annually upon the fair value of all its property in Michigan devoted to the public use—and net not less than eight percentum (8%)

annually upon the fair value as herein apportioned, of all the property of the complainant in Michigan devoted to its intrastate passenger business."

Applying to this the above criterion, this contention is sound if eight percent (8%) is the minimum rate of return at which capital will seek investment in this or similar property, but otherwise it is not. If capital will not seek investment in this or similar property at a less rate of return than eight percent (8%) the complainants are entitled to that rate; if it will seek investment at a lesser rate, then they are entitled to only the lesser rate. The question whether capital will thus seek investment at a lesser rate and if so at what rate, the complainants do not discuss; and before proceeding to discuss it, I will direct attention to the defendants' claims.

The various claims which, as I have said, are made by the defendants, are set forth in their brief as follows:

> "The amount of return which should be permitted varies in different localities, and with different classes of investment, the high mark being regarded as six percent. The question of what is a sufficient rate is a matter of proof; it is incumbent upon the complainant to show the rate of return to which its property is entitled. It has not made such proof, and for that reason, if there be any return, the court must regard it as sufficient. In Michigan, the interest rate is five percent, the rate paid by complainant upon certain of its bonds is four percent, and it is a well known fact that investments in railroad property in this state, do not net more than the last named rate." (Brief p. 148.)

that, if the question is to be determined by the court in the absence of such specific evidence, then

> "the rate of return is necessarily governed by the

going rate of interest or return upon similar investments in the community." (Brief p. 140.)

and that

"in Michigan, the interest rate is 5%, the rate paid by complainants on certain of their bonds is four percent, and it is a well known fact that investments in railroad property in this state do not net more than the last named rate." (Brief p. 148.)

Also that

"6% is generally recognized as a sufficient rate of return in all parts of the country." (Brief p. 147.)

Also that

"the amount of return which should be permitted varies in different localities and with different classes of investment, the high mark being regarded as 6%." (Brief p. 148.)

Herein, it will be noted, the defendants set up another claim which, if sustainable, is decisive of the case in their favor. If, as they here claim, there is no evidence from which to find the rate of return to which complainants are entitled, or to find that they are entitled to more than the rate of return which is to be expected, there can be no finding that the prescribed rate is confiscatory. The claim, however, is, in my judgment, not well founded. It assumes that the only evidence from which the proper rate of return can be found is opinion evidence based on the judgment of experts in railway financiering—an assumption that is unwarranted. Such expert evidence is not a necessity in this or any other judicial procedure, but is merely an aid to judicial deliberation. Its function is, not to prove the facts on which judicial action is to be taken, but to assist the court in drawing the proper inferences from facts proved by other evidence.

It is from these facts that the court must draw its conclusions, whether it has or does not have the help of expert opinion. It would be helpful in this case to have the opinion of experienced financiers as to the minimum rate at which capital would seek investment in this property, but it is not a necessity. Both the expert opinion and the judgment of the court must needs be based upon the facts proven to, or cognizable by the court, and the function and duty of the court to pronounce judment on those facts is the same, whether it is performed with or without the aid of expert opinion. Those facts are the circumstances and conditions of this property which affect its earning power, both present and prospective, and it is upon them, as they are shown in this case, that the court is to form its judgment.

The next claim of the defendants is in the nature of an alternative to that last mentioned, viz, that if the question is to be determined by the court in the absence of expert evidence, then,

> "the rate of return is necessarily governed by the going rate of interest or return upon similar investments in the community." (Brief p. 140.)

This claim is exceedingly indefinite. The "going rate of interest" and "the rate of return upon similar investments in the community" are wholly dissimilar and disconnected facts, and to say that the rate of return is to be governed by one or the other of these facts is to leave the matter suspended in mid-air. If it is governed by one, the other has no bearing upon it. However, this does not matter, for, in my judgment, it is governed by neither of these for the following reasons:

As regards the first—the going rate of interest. The subject of interest rate is one that calls for particular attention in this discussion because it is frequently and variously treated as determinative of the proper rate of

return, and also because, although not so determinative in fact, it has an indirect bearing on the determination of that rate. Such attention, however, will be deferred for the present as it is sufficient to say here that the claim here made by defendants regarding interest rate is inconsistent with their claim that it is the rate at which capital will seek investment in similar property that is to govern, and it is not, therefore germane to the application of the latter principle which we are here making, but on the contrary, is, as a governing factor, necessarily excluded from the case by the adoption of the latter principle.

Rate of Return from Similar Property as a Criterion.

As regards the defendant's alternative to interest claim, viz, that the rate of return is to be governed by the return being realized from similar property in the locality—this, also, is inconsistent with their claim that it is the rate at which capital will seek investment that is to govern.

The mere fact that a certain kind of property is paying a certain rate of return on its reproduction cost does not prove that other capital would seek investment in that property at that rate, or tend to prove it. There is always a great deal of property that capital could not be induced to replace at the rate of return which is being realized from it. Moreover, every "similar property in the locality" if there were such, would be operating under rates artificially limited by statute, and its rate of return, therefore, could furnish no criterion for the purpose in hand.

Furthermore, such a criterion could not, in any event, be applied here because there is no other "similar property in the locality" whose rate of return could be taken

as such criterion. This railroad property is practically *sui generis* in this regard and must be judged accordingly. In order to be a "similar property in the locality" any other property would have to be a railroad property serving the same territory and would therefore be practically a duplication of this property.

The foregoing claims made by defendants are such that I am unable to gather from them exactly what it is that the defendants claim is the rate of return that the complainants are entitled to, further than that it cannot exceed six percent, in any event, and should be considerably less.

Relation of Required Rate of Return to Rate of Interest.

The rate of return which we are seeking to determine, bears a kind of superficial resemblance to rate of interest, and in consequence, it has not infrequently been confused or unduly associated with the latter as substantially identical therewith, as was done in the above mentioned claim of the defendants.

The fact is, that the rate of return which would cause capital to seek investment in property is closely associated with and much influenced by the existing interest rate, but this is due to an external relationship between the two and not to any substantial identity. In determining the proper rate of return, therefore, it is important to consider the subject of interest rate and its precise relationship to the rate of return that will suffice to attract capital to a given property investment.

There are three distinct rates of interest, two of which are fixed by statute and the other by convention, viz: (1) the maximum rate permitted by statute to be contracted for, (2) the rate provided by statute where no rate is stipulated, and (3) the prevailing or going rate

of interest in the community. Of these, the two former have no relation whatever to the question as to what would be a proper rate of return from a given property investment. The fact that the legislature considers a certain percentage the highest rate of interest that parties should be permitted to contract for or that a certain other per cent is the proper rate that a party should be required to pay for the use of money in the absence of a stipulated rate is no indication, whatever, of the minimum rate that would induce capital to reproduce and operate this property. There is no relationship here between the latter and either of the two former that would make the one in any respect the measure of the other, or give it any particular bearing in that regard.

But with regard to the going rate of interest the case is different. That rate does afford some indication of the rate that would be required for the latter purpose because both are dependent upon the money market and each influences the other. But they are not the same. If the going interest rate is 6% it does not follow that the same money market that furnishes the money for a 6% interest investment will be induced to furnish the money for a property investment for a prospective 6% return—that it will be induced to furnish the funds for the construction and operation of a railway for the prospective maximum return of 6%. On the contrary, the fact that the money can be invested at 6% in interest bearing securities proves that investors cannot be induced to invest in this property for a prospective maximum return of 6%, for the very obvious reason that the former is, as regards return, a certain, while the latter is an uncertain, investment—the one an interest bearing investment, and the other a property investment. It is a truism of economics that a higher prospective rate of return is demanded for a property investment then for

an interest bearing investment — usually very much higher.

How much greater the prospective rate of return would have to be in any particular case would depend upon the degree of uncertainty as regards the realization of the prospective return, and that degree of uncertainty would depend upon the facts and circumstances of the particular case. Given the going rate of interest, the problem in every individual case would be to estimate the additional return that would be required in order to compensate for the uncertainties and consequent risks of that particular enterprise. The first step, therefore, is to determine the rate that is to be taken as the going rate of interest. The going rate of interest fluctuates at different times and in different places, according to a great variety of circumstances, but the fluctuations are not very great and a fairly constant average rate is maintained. It is safe to say that the going rate of interest in Michigan on moderate amounts reasonably secured is 6% and in large amounts well secured from 5% to 5½%. Upon the large amount that is involved in this case, I find that the going rate of interest is 5%. On this basis the complainant's claim of 8% would call for an increase of 3% over the interest rate in order to compensate for the uncertainties of the business, and enlist the required capital. Those uncertainties, as above quoted from complainant's brief, are, severe winters and other unusually hard operating conditions, the exhaustion of forest products, the possibility of a loss of its ore, and other business, the competitive conditions encountered both from water and rail competition, and the lack of any substantial increase in the business during the 27 years of operation. Precisely what effect these uncertainties would have upon the mind of a prospective investor, it is, of course, impossible to say, but that they would cause him

to demand considerably more than the going rate of interest as a condition of making the investment is very certain.

Some light upon this question is obtainable from the company's own experience.

When the State of Michigan and the United States desired the construction of the road from Marquette to Houghton, which now forms part of complainant's system, it was found necessary to make large donations of public lands in aid of the project although a passenger rate of five cents per mile was allowed to be charged. The same thing was true when the State desired a road to be constructed from St. Ignace to Marquette, and this piece of road it was never possible to operate profitably as a separate property.

I think it a fair inference from the testimony that the line between Nestoria and Duluth was constructed chiefly in the hope of remedying this situation. The history of the earnings of the complainant for the 27 years since it acquired these properties does not show that the conditions and uncertainties have since changed for the better, and it is very doubtful whether even a prospective return of 8% would induce capital to seek investment in this property. To what extent those conditions have, in fact, changed, it is hard to say, but it is well known that the country tributary to the road is, generally speaking, still in an undeveloped condition—a condition as regards development and opportunities and prospects for the earnings of this railroad, little, if any more favorable than when the consolidated company was formed.

From the foregoing considerations and viewing the subject from every standpoint, the conclusion would seem to be justified that if the required capital could be induced at all to reproduce and operate this property, it could not be so induced by a prospective return of less

than the 8% claimed by complainants which would be an increase of 3% over the going rate of interest as found by me. I do not, however, find that the complainants are entitled to that rate of return, but following the rule of resolving all doubts in favor of the defendants, I reduce the 3% increase by one-half, and find that the minimum rate of return which the complainants are entitled to under the constitutional guaranty is 6.5%.

The foregoing conclusion is predicated entirely on the application of the criterion, that it is the per cent of return that would cause other capital to seek investment in this property, that the company is entitled to, which criterion is accepted by both parties in this case. The adoption of this criterion by both parties in this case necessarily excludes all others, and I have, therefore, not deemed it necessary to discuss any other. There is, however, a different theory which ought perhaps to be referred to, the theory, namely, that the proper criterion is the rate of interest prescribed by statute where no rate is stipulated—that if the prescribed rate of fare will yield a rate of return equal to that statutory rate of interest the rate of fare cannot be held confiscatory. This theory, it seems to me, is the result of a misapprehension of the particular kind of so-called confiscation that is here complained of—the same misapprehension that gave rise to the doctrine formerly held by the courts but now abandoned, that if the rate of fare yields any return at all on the property, the rate is not confiscatory. The theory assumes that the act here complained of is confiscation in the ordinary sense, which means the taking away of the ownership and possession of property held in private ownership, and transferring it to the public; whereas it is in fact not confiscation in that or in any proper sense of the word confiscation as ordinarily used but an unlawful act that bears some resemblance to con-

fiscation in that it takes away from private owners and gives to the public some of the benefits of ownership. Whether it is thus confiscatory or not depends not upon whether the owners are deprived of the ownership of their property or of any portion of it, but whether they are deprived of any of the benefits of their ownership. If they are deprived of any of these benefits, that is to say, deprived of any portion of the fair return from the property to which they are equitably and therefore constitutionally entitled, the act is confiscatory within the meaning of that word as used in this class of cases, and therefore unlawful.

Assuming that the company is entitled to a full and fair return upon the value of the property, it will seem to be so obvious as to admit of no argument that if by legislative enactment any portion of that fair return is taken away there is confiscation in effect as certainly as though some portion of the physical property were actually taken.

This being so it will be seen that the fact that the legislature considers a certain rate of interest to be the fair measure of damages for breach of a contract for the payment of money is no criterion or indication by which to judge the question whether a given rate of fare is or is not thus confiscatory.

Resume.

I have now finished the consideration of the three principal questions on which depends the one main question in the case—that one question being whether the prescribed rate will afford a fair return on the value of the property employed and the three principal questions subordinate thereto being, (1) the value of the property employed, (2) the rate of return thereon to be expected under the prescribed rate, and (3) the rate to which the

complainants are entitled under constitutional guaranty.

I have found (1) the entire value of complainant's property to be $13,901,938; (2) the value of the property employed in the complainant's Michigan intrastate passenger service to be $2,741,872; (3) the rate of return to be expected thereon under the prescribed rate to be 2.24 per cent, and (4) the rate of return to which complainants are entitled under the constitution to be 6.5%.

These results differ widely from those claimed by either of the parties. The latter are as wide apart as the poles.

The complainants claim that the present value of their entire property is $17,044,081; while the defendants claim that it is only $11,457,169; the difference between the two claims being $5,586,212, or approximately 50 per cent of the latter. As between these conflicting claims my valuation of $13,901,938, it will be noted is much nearer that of the defendants than that of the complainants, being $3,142,143 less than the complainants and $2,444,769 more than the defendants. And as a matter of actual valuation it will be seen on examination that the difference between my valuation and that of the defendants is much smaller than those figures would apparently indicate, because the difference above mentioned is largely made up (more than 50 per cent) of items disputed *in toto* by defendants and omitted entirely from their valuations: those items amount to $1,347,657, and are as follows:

Contingencies (Schedule 37)	$ 400,000
Interest during construction (Schedule 40)	547,657
Taxes during construction (Schedule 40)	100,000
Appreciation	300,000
	$1,347,657

The questions involved in these items although tributary to the work of valuation are questions of law and of method of valuation rather than questions of value.

Deducting the total of these disputed items from the excess of my valuation, over that of the defendants, makes the difference in actual valuation to be $1,097,112.

Of this latter amount the greater part consists in differences of land valuation, those differences amounting to $634,828. The total of my land valuations is $1,780,-239, being $329,616 less than that claimed by complainants, and $634,828 more than the value conceded by defendants. Upon these differences in land valuation a word of general comment and explanation here seems desirable.

Land valuation, always a difficult matter, is especially difficult here, because of the great number of parcels and the wide differences between them, both as regards locality, character, and surrounding conditions and also because the valuation must be made from the testimony. It is always easy to find expert appraisers who will place a high value on a given parcel of land and equally easy to find those who will place a low value, and the latitude for honest difference of opinion is frequently such that there may be a wide difference between estimates made by witnesses equally honest and trustworthy. Such instances are quite numerous here, and this together with the great number of separate parcels to be valued and the great volume of testimony to be considered have made the task of land valuation a very arduous one. There are more than 160 different descriptions of land to be valued separately and several thousand pages of testimony relating thereto. To the work of valuing all of these lands in the light of the testimony introduced, I have given a great deal of time, and study—possibly more than the exigencies of the case absolutely required;

but if so, it was because I thought it better to err, if at all, in that direction, rather than in the opposite one. Moreover I am thereby enabled to feel a greater assurance than I otherwise could of the fairness of my valuations. I am convinced beyond a reasonable doubt that, while my valuations may, in some individual instances err on one side or the other, the total of my land values is a fair and conservative estimate of the value of complainants' lands such as is called for in a rate case, and that it does substantial justice to both parties.

The residue of the excess of my valuation over that of the defendants, viz: $462,284, is largely due to differences in estimates of degree of depreciation, affecting present value, rather than direct estimates of value. In two of such instances, amounting to $170,124, the question in dispute was not as regards the amount of depreciation, but whether there was or could be any depreciation whatever. These instances were Ballast and Track Laying and Surfacing; the defendants claiming that the former had depreciated in the amount of $107,000 and the latter in the amount of $63,124. Aside from these items the excess of my valuation of the physical property other than lands over that of the defendants is only $292,160, a considerable part of which consists of differences in amount of depreciation. Here as in the case of land values, I believe my valuation to be substantially just to both parties and that the errors, if any, cannot be such as would materially affect the final result.

With regard to the rate of return on these property values to be expected under the prescribed rate, the parties are no less at variance. The complainants claim that according to the results of the business of 1913 the results to be expected from the Michigan intrastate passenger business under the reduced rate will fail to pay any return at all on the value of the property; not only

so, but that it will fail even to pay operating expenses by the sum of $32,794.10.

On the other hand the defendants claim that the Michigan intrastate passenger business under the reduced rate will according to the results of 1913, be highly remunerative and will yield a very large return on the value of the property employed therein. They present seven different estimates of the same made upon as many different bases. These vary in amounts and percentages of return, but each claims a very high rate of return on the value of the property employed in the passenger service—the lowest being 11.73 and the highest being 21.74. They are as follows:

	Passenger Intrastate	Freight
1	21.74	3.70
2	19.58	4.30
3	18.22	4.68
4	15.50	2.58
5	19.25	1.72
6	13.04	3.19
7	11.73	3.56

In all these claims the valuations of the property and its allocations and divisions between services are substantially the same, and in all of them the amounts of total income are the same. So that the variations of percentages between the different estimates are due chiefly to variations in the bases of division, of property, income and expenses.

In these claims the total property valuation taken by defendants is $11,457,169; the passenger proportion $2,360,305 and the intrastate $1,547,888. The total property valuation thus taken ($11,457,169) is arrived at by applying to the Riggs' appraisal of 1913, the modifications which defendants claim should be made. These

estimates are thus made on a basis of reproduction cost, although the defendants claim that it is commercial value rather than reproduction cost value that is to govern, and that the former is shown by the evidence to be a less amount than the latter, viz, $11,144,946. It is immaterial, however, whether these estimates are based on the one valuation or the other, for they have no bearing on the question whether the statute is confiscatory, because they are all based on an assumption which prejudges the question of confiscation — the assumption, namely, that there will be no reduction in earnings in consequence of the reduction in rates. They make no allowance for any reduction in earnings, but assume that the earnings under the 2 cent rate will be at least as great as they have been under the 3-cent rate, because of increased traffic. When this assumption is made it is idle to go farther. If the new rate will not reduce the earnings either gross or net, the statute can, of course, by no possibility be confiscatory and the case is ended then and there. Any division of property or expenses or computations of percentages made thereafter would be useless as they could not alter the fact that the statute is not confiscatory in any event.

These estimates and computations, however, are instructive in their reflex bearing on the question of the division of property and expenses between passenger and freight—a bearing which tends strongly to confirm the method of division adopted herein. There can be no question that in the regulation of rates either by the State or otherwise, passenger rates and freight rates should be adjusted with a view to producing an equitable division of the burdens to be borne by travelers and shippers respectively so that neither shall be compelled to bear the proper burdens of the other. The two services, passenger and freight, although necessarily treated as separate and

distinct for the purposes of this case, are, to a great extent, a joint enterprise in which each is largely dependent upon the other. They are so dependent, because under existing rates, neither could exist financially without the other. More than three-fifths of all the property employed by the complainants in railroad use is used in common by both services and as all this common property would be required for the rendition of either service alone in the absence of the other, neither service could be rendered by itself alone without a large increase in rates for that service—an increase in all probability greater than the business would bear. It is quite certain that this road would not be built either as an exclusive freight road or as an exclusive passenger road. Hence it must be assumed that the rates fixed by the State are adjusted with a view to producing a proper adjustment of burdens to be borne by the two services respectively. And as it would be necessary in making such adjustment to make a division of the common property and expenses, it must also be assumed that the State before enacting this statute made such division and made it with that end in view. This being so, is it possible to assume that the method of division of common property and expenses employed by the State for this purpose was the method here employed by defendants, or one that would be productive of such results as are shown by these estimates to be produced under the method of division employed by defendants? According to one of these estimates the passengers traveling on complainants' road are paying a return of 21.74 per cent on the value of the property employed in their service, while the shippers of freight are paying only 3.70 per cent on the value of the property employed in their service; according to another of the estimates the former are paying 19.35 per cent and the latter only 1.72 per cent and all of these show a similar

great disparity in per cent of return. And as above pointed out, this disparity is due chiefly to the method of division employed. As it cannot be supposed that the State would make an adjustment of rates which would yield so large a return on the passenger property, and so small a return on the freight property, thereby either compelling passengers to bear a large part of the burden properly chargeable to shippers or else confiscating a large part of the company's freight property for the benefit of the shippers, it would seem clear that the defendants' method of division is not that which was employed by the State in adjusting the rates, or a method of division which should be chosen in preference to that adopted herein. As the sole purpose of the division is to arrive at an equitable apportionment of the burdens necessary to be borne, in choosing one or the other of two proposed methods that one is to be chosen which will produce the most equitable apportionment of burdens. Under the method of division employed by me, the rate of return on the two classes of property also exhibits an inequality similar in kind to that shown by these estimates, but far less in degree, the rate of return on the intrastate passenger property under the 3 cent rate being 6.89 per cent and on the intrastate freight property 3.08 per cent.

In considering the question of the division of the common property it is to be borne in mind that the division is primarily and principally a matter between travelers on the one hand and shippers of freight on the other, rather than between the company and the public.

What the company is entitled to, and all that it is entitled to, under constitutional guaranty, is a fair return on the value of the entire property both freight and passenger, and except where, as here, a separation becomes necessary because one rate only is involved, it is immaterial to the company whether passenger and freight rates

are as regards each other equitably adjusted so long as the total return is sufficient.

It appears in this case from my findings that the entire return which the company has been receiving under existing rates is insufficient to pay the fair rate of return upon the entire property to which they are entitled, and that the deficiency is due almost entirely to the failure of the freight service to pay a fair return on the value of the property employed by it; and this is so even where the freight property is determined by the division of the common property on the basis adopted by me. Even there it appears that the rate of return on value of property employed paid by shippers of freight is but little more than 50 per cent of that paid by travelers. And yet, notwithstanding this fact the defendants would here justify the proposed reduction in passenger rates by a division of common property and expenses which would greatly increase the proportion chargeable to freight, and correspondingly decrease the proportion chargeable to passenger, thus greatly increasing the mal-adjustment of rates already existing.

This method of division would, if adopted, sustain the 2 cent rate, but as the company are already bearing a portion of the burden properly chargeable to the freight service and as the portion thus unfairly borne by them would be thereby largely increased, the injustice of such a method of sustaining the rate would be very conspicuous.

This method of division proposed by defendants would if adopted defeat the complainants' case, and it is one of a number of distinct points of defense, any one of which if sustainable, would also defeat the complainants' case. Those points of defense are eight in number and are as follows, viz:

1. That the complainants are estopped from contesting the validity of the statute by the acceptance of land grants.

2. That the value on which complainants are entitled to a return is commercial value and that the same has not been proven.

3. That the common property and expenses must be divided between passenger and freight on the basis of time of occupancy as proposed by defendants.

4. That the sleeping and dining car services must be treated as outside operations and not a part of the service to which the prescribed rate applies.

5. That the complainants must prpove every material fact beyond the possibility of a doubt.

6. That the presumption in favor of the statute although disputable in theory is indisputable in fact.

7. That the complainants must prove by affirmative evidence that the loss from decreased rates will not be overcome by increased traffic.

8. That complainants must prove what per cent of return they are entitled to; that they have failed to make such proof, and are therefore not entitled to the relief prayed for.

If anyone of these points of defense is sustainable, the complainants' case must fail. If none of them is sustainable then the final result depends upon the question of fact, whether upon the evidence offered the prescribed rate will yield a fair return on the value of the property employed in the passenger service—the property being valued on the basis of replacement cost, and the common property being divided on the revenue train mile basis, and the dining and sleeping car property being included therein.

Upon this main question thus stated, I am convinced from the evidence beyond a reasonable doubt that a 2 cent rate will not yield such return and that its enforcement should therefore be enjoined.

In reaching this conclusion I am not unmindful of the serious nature of the case and of the remedy invoked. It is true, as has been so strongly urged by defendants, that the power of the judiciary to enjoin action taken under legislative sanction is a very high prerogative and one that should be exercised with great care and circumspection; but it is also true that the higher the prerogative, the more imperative the duty to exercise it wherever that duty is clear.

In this case, unless my findings relative to the eight points of defense above specified are erroneous, that duty, I find, is clear and its performance desirable in the interests of all concerned. This is one of those rare cases in which it is to the best interests of both parties that just and equitable results be reached—to those of the State, no less than to those of the company. While it is the duty of the counsel for the defense to maintain this law, if possible, and to that end to employ all available defenses, technical or otherwise, (which duty has been performed to the utmost in this case) it is not the interest or presumably the desire of the State that this rate be enforced against the complainants, if, in fact, such enforcement would deprive them of the fair return on the value of their property to which they are equitably and constitutionally entitled.

Such enforcement would not only be no benefit to the State, but would, on the contrary, be a distinct and serious injury, both to the State and to the community served by this railroad, in that it would inevitably cripple the company and impair the service rendered by them.

To realize that such impairment of service would thus

be a serious injury, it is only necessary to recall that this is the self-same service which was heretofore deemed so desirable by the State that it made large donations of land and permitted the charging of a five cent fare in order to secure it. And to see that this was wise policy on the part of the State, it is only necessary to consider the geography of the two peninsulas of which the State is composed and the isolation and the condition as regards economic development of the northern peninsula and its need of this railway service. This railway is not only greatly needed by the community which it serves, but is also a very important factor in promoting the commercial and industrial unity of the two peninsulas which ought to accompany their political unity, as it is the only direct railway connection between them.

Before closing this report, a word of explanation of the causes of the long pendency of the suit before the Master may be appropriate.

That length of pendency has resulted from a number of causes, but chiefly from the multitude of questions involved and the great amount of testimony deemed necessary to be taken. The time required for the latter purpose was very considerably increased by the fact that the testimony was originally taken on the same theory as that on which the testimony in the Minnesota Rate Case was taken, and when that theory was disapproved in the decision of that case, it became necessary to retake a great part of the testimony in this case, conformably to that decision—the time limited for the taking of testimony having been extended for that purpose by order of the court.

The taking of testimony began July 8th, 1912, and was completed August 12th, 1914. From the latter date until February 17th, 1915, the time was consumed in making of briefs and of other preparations for oral argu-

ment, which began on the day last mentioned and continued from day to day until March 10th following, when the cause was submitted to the Master. The length of time since consumed has been due primarily and chiefly to the great amount of work involved in the consideration of the multitude of mooted questions, both of fact and law, and of the testimony on which the former depended; and secondarily, to the temporary inability at times of counsel, by reason of illness, to give promptly the assistance required by the Master; and also to the inability of the Master to work at all times continuously because of eye strain resulting from excessive reading of typewritten matter. Although as early a termination of the cause as practicable was desirable, it is believed, nevertheless, that the time thus consumed has been, in the main, well spent, by reason of the more thorough trial of the issues involved and a fuller presentation of the merits of the case thereby attained than would otherwise have been possible.

I return herewith, as part of this, my report, the following papers and documents, viz:

A full report of the proceedings before me in the taking of testimony, consisting of 10,719 pages of typewritten testimony, bound in thirty-five volumes.

In the course of said testimony many papers, documents and maps were produced and offered in evidence and marked as exhibits as follows, viz:

On the part of the complainant 97 exhibits, numbered respectively from 1 to 96, with a duplication which causes 2 separate exhibits to be numbered "90"; on the part of the defendants 83 exhibits, numbered respectively 1 to 83; which exhibits, together with a descriptive list or catalog thereof, are herewith separately filed with the court as a part of said testimony.

In connection with their objections to the tentative re-

port, defendant's counsel requested that the details of my computations involved in reaching the results set forth in the report be made a part of my report, but as the same are voluminous and can be checked and verified by any competent accountant, I do not think it proper to embody them in the report as a part thereof, but will file them along with this report and furnish the parties with copies thereof.

Since the foregoing was written, the details of computations therein referred to have been furnished to defendants and a memorandum specifying what they deem apparent errors and needed corrections therein has been received from them by the Master—such specifications being numbered consecutively from 1 to 12 and being here taken up in their numerical order.

Specification 1. This specification claims that the revenue train mile ratio used by me is erroneous in three particulars designated respectively as a, b and c.

In respect to (a) I find that the defendants are right and have revised my figures accordingly.

In respect to (b) I find that the defendants are right as to the Michigamme Mine Branch consisting of .31 of a mile, but in error as to the other mine branches therein mentioned, as it appears from the evidence that merchandise switching was done in 1913 on the latter branches.

In respect to subdivision (c) I find that the defendants are in error as to the Hunter Branch, and the old Negaunee Mine Branch for the following reasons, viz: The Hunter Branch was in existence and was used by complainants in 1913, and it therefore participated in the stational time therein referred to.

Also with regard to the Old Negaunee Mine Branch (.96 of a mile), for the reason that the same was not included in my computations as it is a part of the Negaunee yard and that entire yard was excluded.

With regard to the Danber Branch, I find that the defendants are right in their claim that the same should be excluded and I have revised my figures accordingly.

Specification 3. This relates to a revenue item, $6,750.77, received by complainants in 1913 from the Chicago and North Western Ry. under an agreement between them and that company by which complainants received daily from the C. & N. W. Co. at Negaunee, Mich., certain trains of passenger cars belonging to the latter company and operated them on complainant's road between Negaunee and Houghton—the locomotive and entire train crew for such operation having been furnished by complainants. By the terms of this agreement the complainants received all the fares of the passengers carried in such trains between Negaunee and Houghton both through and local and also in addition a train mileage of twelve and one-half cents to be paid them by the C. & N. W. Co. It is this mileage that is represented by the $6,750.77 in question. The question is as to the proper disposition to be made of it—whether it should be accounted as passenger revenue derived from the passenger business of complainants or as a common revenue derived from the rental of the common property over which these trains are operated. In the accounts put in evidence and in the computations heretofore made, it is treated as a rental received from the use of common property and as such divided between freight and passenger in the same manner as other rentals of common property are divided, but the defendants claim that it is not a rental of property but a passenger train earning and that it should therefore be treated not as a common revenue but as a passenger revenue wholly.

In this contention I think the defendants are right. A rental of property is money paid by a lessee for the privilege of using and occupying property of the lessor,

but in this transaction the C. & N. W. Co. neither uses nor occupies any property of complainants, but on the contrary the complainants use and occupy some of the property of the C. & N. W. Co. (the cars composing the trains) and these trains are regularly operated by the complainants and they differ in no respect from the complainants' other regularly operated passenger trains except that the coaches composing the trains are owned by the C. & N. W. Co. If in addition to owning the cars, the C. & N. W. Co. owned also the locomotives and with their own crews operated the trains, the mileage paid for the operation of such trains might properly be treated as a rental of common property. This is precisely the case in another agreement between these parties under which the C. & N. W. Co. operated its own trains on complainant's road between Ishpeming and Marquette, and pays a trackage or train mileage which is treated as a rental of common property.

The precise nature of this item sufficiently appears from the terms of the agreement and the nature of the transaction and from these it appears that it is a compensation paid to complainants for their co-operation in maintaining a through passenger service without change of cars from all points from Chicago north on the line of the C. & N. W. Co. road to that section of Michigan known as the Copper Country.

It is clear that the item is a purely passenger revenue and should be so treated and I have revised my figures accordingly.

Following the foregoing specifications of error No. 3 the defendants have another specification also numbered 3 (evidently by inadvertence) which relates to gross revenue from sleeping cars.

In this specification the defendants are in error, the sleeping car gross revenue of $30,243.11 found by me in

my exhibit 5 is determined from the testimony of A. E. Delf in the introduction to complainant's exhibit 67 on sheet 24 and this amount it appears from his testimony is shown by the reports in his office of sleeping car tickets sold. As each ticket shows the point of sale and the point of destination, the revenues from sale of tickets wholly within the state allocate themselves and the revenues from sale of interstate tickets are allocable as the part of the entire journey made in each state is readily determinable. There is therefore no occasion for dividing the total sleeping car revenue between states in the manner specified by defendants or in any other manner.

Specification 4. This specification points out a clerical error which I have now corrected.

Specification 5. In my division of operating expenses for 1912 and separating to Mail and Express, I follow the method of defendant's witness Mr. Thompson but I now find that Mr. Thompson was in error in the respect here pointed out by defendants and have revised my figures for 1912 accordingly.

Specification 6. In my separation of the common property here referred to, I followed the method offered by defendants on page 234 of their printed brief. But I find that the method now suggested by them is more equitable and have revised my figures accordingly, except that I have revised their proposed correction by including overheads which they presumably omitted by inadvertence.

Specification 7. In this specification I find that the defendants are right as to the principle on which the common portions of the accounts there mentioned should be divided, but wrong in their results of the application of that principle; that the proper ratio for 1913 is: Passenger, 35.9 per cent, freight 64.1 per cent instead of

30.08 passenger and 69.92 freight, as shown in Note 10, of my Exhibit 6.

Specification 8. This specification relates to what defendants therein call the "out of pocket costs" on account of the diner service, meaning by "out of pocket costs" as I understand them, that portion of the operating expense for 1913 which would not have been incurred if dining cars had not been operated; and it says that these costs were overlooked by me and claims that they would be at least $19.715. The defendants are here correct, in stating that the finding of such costs was omitted by me, but they were omitted because they were immaterial and not from inadvertence, and they are correct also in claiming that such costs would amount to more than the amount last mentioned, as I now find them to be in fact the sum of $25,805. This amount is arrived at by applying the percentage of 39.84 given by defendants as the correct one in their specification next following, numbered 9.

Specification 9. This specification points out that the separation of expenses for 1913, assigned to sleepers and diners, heretofore made by me, was on the basis of tonnages and percentages of 1912, whereas it should have been on those of 1913. This specification is correct and I have changed my figures accordingly.

Specification 10. This specification relates to the division between passenger and freight of the annual taxes paid in Michigan and alleges that the division heretofore made does not mathematically follow the rule for their division laid down by me in the report and claims that the assignment made of the taxes to passenger in 1913 is at least $1,000 too great. In this the defendants are right in part and wrong in part. The rule of division laid down by me is that which was agreed upon by the parties as stated on page 350 of the report and is as fol-

lows: "that taxes should be apportioned between the services passenger and freight respectively in proportion to the respective valuations."

The defendants are right in their claims that in the application of this rule the part of the property in Michigan which had been assigned to Wisconsin should have been excluded, but was not; and my figures have been corrected accordingly. But they are wrong in their claim that the passenger proportion of taxes heretofore found by me is at least $1,000 too great. The amount in which it was too great was the sum of $680.09 . The passenger proportion of taxes in 1913 is $40,203.03 and the manner in which it is arrived at is shown on page 25 of the computations of exhibits 2 and 8 filed herewith.

Specification 11. This specification relates to the division of mail and express proportion of operating expenses between inter- and intrastate for 1910 and 1911, and claims that in such division the percentage of 55.95 intrastate should have been used instead of 65.95.

The ratio of 65.95 used by me was obtained in manner following, viz: a portion of the passenger operating expenses for each of the years 1912 and 1913, was assigned to mail and express; using the Thompson ratios. The amount so assigned to mail and express I opportioned to interstate and intrastate in the same manner as the total passenger operating expenses had been apportioned between inter and intra.

As there was no evidence from which like ratios could be obtained for assigning a portion of the expenses of 1910 and 1911 to mail and express, I assigned the expenses to mail and express and to intrastate and interstate on ratios derived from the totals of the 1912 and 1913 assignments. The defendants' ratio of 55.95 is evidently based upon the number of passenger miles made inter and intra, respectively in 1910.

The question therefore is which of these bases of division should be used; and I find that the basis which gives the 65.95 percentage should be used because that is the same basis on which the entire passenger expenses were divided between inter and intra for the years 1912 and 1913. On recomputation, however, I find that the percentage should be 65.81 instead of 65.95 as shown on page 23 of the computations of my exhibits 2 to 8.

Specification 12. This specification relates to the apportioning to Wisconsin of property in Michigan used in the general service and claims that in addition to the property already so apportioned there should be included certain tracks at Marquette and Thomaston which they designate as "sidings" but which are more properly called shop tracks; and certain frogs and switches. In this I find that the defendants are correct except that the two tracks at Marquette which they call "Old Car Shed East Side" and "Old Car Shed West Side" are exclusively freight tracks instead of a common freight and passenger. My figures have been revised accordingly and the same are found on page 18 of the computation of exhibit 1.

The several exhibits referred to in and made a part of this report, being nine in number and being marked Exhibit A and exhibits numbered from 1 to 8 respectively, are returned herewith and are bound in a separate volume, instead of being attached hereto, for the reason that they are of such shape that it is was impracticable to so attach them, although they are referred to in the body of the report as being so attached.

I am unwilling to close this report without some acknowledgment of the ability and thoroughness with which the work of counsel upon each side has been performed. In a case of this magnitude and complexity it would never be possible to say that everything had been

done that could aid in the correct determination of all the questions involved; but with the single exception of the question of appreciation, as hereinbefore explained, I believe it can safely be said in this case that nothing of importance that would afford such aid has been left undone by counsel upon either side.

I wish especially to acknowledge the efficient assistance which has been given the Master by counsel upon each side whenever called upon by him. This acknowledgement would not be complete if it did not include also the work of the accountants and other experts on each side which also has been no less characterized by ability and thoroughness.

In conformity to the order of the court the Master submits a form of decree which he recommends to be entered in this case, and the same is hereto annexed and made part of this report.

All of which is respectfully submitted.

HERBERT L. BAKER,
Special Master.

January 29, 1917.

UNITED STATES DISTRICT COURT,

EASTERN DISTRICT OF MICHIGAN,

Southern Division in Equity.

Duluth, South Shore & Atlantic Railway Company,

Complainant,

vs.

Grant Fellows (substituted in place of Franz C. Kuhn), Cassius S. Glasgow, Lawton T. Hemans, Charles S. Cunningham (substituted in place of George W. Dickenson), Morgan W. Jopling, John R. Van Evera and Fred S. Case,

Defendants.

DECREE.

The above entitled cause was submitted to the Master on arguments by Messrs. Arch B. Eldredge, solicitor, and Joseph B. Cotton and John E. Tracy, of counsel, on behalf of complainant, and by Roger I. Wykes, Esq., of counsel, on behalf of defendants.

After deliberation, it is ordered, adjudged and decreed,

Section 1. That the act of the legislature of the State of Michigan, complained of in this suit, being Act No. 276 of the Public Acts of the State of Michigan for the year 1911, is, in its effect upon the property of complainant,

confiscatory and will, if enforced against complainant, operate to deprive the complainant of its property without due process of law, and therefore said act is, so far as it relates to the said complainant, its officers, directors, agents and employees, hereby declared to be in violation of the Constitution of the United States, and void and of no effect as to the complainant.

Section 2. That said Grant Fellows, Attorney-General of the State of Michigan, and his successors in office, and Cassius S. Glasgow, Lawton T. Hemans and Charles S. Cunningham, and their respective successors in office, constituting the Railroad Commission of said State, be and they are, and each of them is, hereby permanently enjoined and restrained from attempting to compel the said complainant to observe, publish, post or put in force the rates of fare prescribed by the said act complained of, except as they may be hereafter otherwise authorized by this court, and that they are, and each of them is, further permanently restrained and enjoined from taking any action, step or proceeding against said complainant or any of its officers, directors, agents or employees, to enforce any fines, penalties, or punishments for the violation by them of the said act of the Legislature of Michigan, except as they may hereafter be otherwise authorized by this court.

Section 3. That said defendants, Morgan W. Jopling, John R. Van Evera and Fred S. Case, and all other persons making use of complainant's line of railway, be and they are, and each of them is, hereby permanently enjoined and restrained from instituting or causing to be instituted any action or proceeding to collect from complainant damages or penalties for any violation of the said act.

Section 4. That the subject of the costs of this suit be reserved for future consideration by the court.

Section 5. It is further ordered that the order of this court, dated the 26th day of September, 1911, requiring the complainant, during the pendency of this suit, to issue to all persons traveling intrastate on its road, refund coupons agreeing to refund to the holder of the same an amount equal to the difference between the rate of fare charged such passenger for transportation and the rate prescribed in the act complained of, is hereby set aside and annulled and said coupons are adjudged to be of no validity or value, and the bond provided to be given by said complainant for the redemption of said coupons is hereby discharged and the order heretofore entered on the 22nd day of October, 1915, directing the complainant to set aside a special bank deposit for the redemption of said coupons is also set aside and annulled.

Section 6. It is further ordered and decreed that jurisdiction of this case be, and the same hereby is, retained by this court, for the purpose that the members of the Railroad Commission and the Attorney-General of the State may apply, at any time, to the court, by bill or otherwise, as they may be advised, for a further order or decree whenever it shall appear that by reason of a change in circumstances, the rates fixed by the act complained of are sufficient to yield to the complainant reasonable compensation for the services rendered.

OBJECTIONS TO THE FOREGOING FINDINGS AND RULINGS BY THE MASTER THEREON.

The foregoing findings were on 20th day of May, 1916, served on counsel for the respective parties and opportunity was thereupon given them to make such objections thereto as they might desire.

Afterwards objections were received from the re-

spective counsel and were carefully considered by the Master.

The said objections and the rulings of the Master thereon are as follows:

Complainant's Objections.—Valuations.

The complainant objects to your valuation of Schedules 1, 3, 5, 7, 16, 19, 23, 28, 29, 30, 36, 37 and 40, and to your reduction of the amount claimed by complainant for appreciations, and will desire to make specific objections to them in accordance with the usual practice when your report is presented to the Court for confirmation. It is, however, very apparent from your report that the testimony has been carefully studied and your judgment appears to be deliberate, and therefore, in view of the very thorough argument there has been upon these schedules, complainant will not ask for further consideration of them at the present time, except as hereinafter indicated.

With reference to Schedule 19, complainant renews its objection to the assingment to Wisconsin of any portion of the value of shops, engine houses and turntables located in Michigan. It renews its contention that the location of that property in Michigan is conclusive, and that its entire value, as a matter of law, is assignable to the property upon which complainant is entitled to earn a return in this case.

The same objection applies, also, to Schedule 20 (shop machinery and tools), to which we make no other objection.

Taxes during Construction.

We desire to call your attention particularly to your allowance for taxes during construction. The average of the taxes paid by the complainant for the years 1912 and

1913 are $200,907. This is practically 1.429% on the total valuation of complainant's property which you have found, to-wit, $13,979,928. The total of the physical property items (Schedules 3-28, inclusive) in your valuation, exclusive of lands and rolling stock, is $7,808,280, on which one year's taxes at the rate above named would be more than $111,000; so that your total allowance of $100,000 for taxes during construction is less than one year's taxes on the above named schedules.

You have found the period required for construction to be not less than three years. I think we may safely assume that on that basis the first year of construction would be one of small taxes, the second of medium taxes, and the third of taxes upon practically all the property. On the basis of an average of one and a half years of taxation, which the evidence with reference to interest during construction would clearly justify, the allowance for taxes should be at least $165,000.

If we assume, however, that taxes should be computed for the same time that you have used in computing interest during construction on the schedules above mentioned, the allowance would be $128,344.

It is perfectly apparent from Mr. Hansel's testimony with reference to his allowance of $50,000 for taxes on property other than lands, that he went upon the theory that before the property began to be operated, there could be some arrangement made with the taxing authorities by which the complainant could be relieved from paying its lawful taxes. This assumption is certainly not one which can be made by a court; on the contrary, the assumption must be that lawful taxes will be assessed. Mr. Hansel's testimony above referred to will be found at Record pages 4515-6.

We therefore respectfully ask that the item of taxes during construction should be increased, and we urge

that the evidence fully justifies an allowance of $150,000, and does not justify an allowance of less than $128,000.

Estimated Return to be Expected on Complainant's Passenger Property Under the Two-Cent Rate.

Under this heading we desire to renew our claim that the typical year adopted to determine probable future results cannot properly be obtained by using a four years' average of the results of actual operations without taking into consideration the undisputed proof in this case of the increase in wages and prices of material since 1910.

You have, however, found as facts (Report 227-8) "that since 1910 there has been a substantial increase in the rate of wages paid by complainants in almost all classes of labor employed by them; that a large proportion of this increase came from a raise in wages for trainmen, and that this increase is probably permanent"; and that "since 1910 there has been a steady increase in the price of railway supplies generally, and particularly in the prices of ties."

You also say (at p. 227) of the facts thus found: "The facts there alleged are, if true, proper to be given consideration in connection with the general question as to what is to be expected in the future in view of past experience, not only in general, but also and especially in view of the particular experience of the typical year."

In your letter of May 20th you say of the report handed to counsel: "These two parts are intended to cover everything except the question as to what is required to constitute a sufficient rate of return", which question you reserve for consideration until after the objections asked for in that letter have been considered.

We take it, therefore, that due and proper considera-

tion will be given to the question of increase in wages and in prices of material in that article, and that it is unnecessary at the present time to do more than call your attention to our claims.

In this same connection we again raise the question of depreciation not charged as an expense item in the years 1910, 1911, 1912 and 1913. On page 226 of your report you refuse to consider this depreciation in forming your typical year because you say "that complainant has not furnished testimony from which I am able to determine with sufficient definiteness a proper amount for such item."

We believe that in this statement you are in error, and we call your attention to the testimony of Mr. Riggs (Rec. p. 262) in which he sets forth a table of depreciation which he used for bridges, trestles and culverts. His testimony with regard to the propriety of the use of this table is, so far as we know, undisputed in the case, and from it every item of depreciation claimed by us can be calculated, and the manuscript brief of Eldredge and Tracy gives these computations on page 46.

$12,000 Paid President Fitch on His Retirement.

We desire to object to the action of the Master with reference to this item. The undisputed evidence (Rec. 7752) shows that this allowance was an adjustment of salary. You treat it as though it were a gratuity.

It appears that Mr. Fitch was president and general manager for many years. Even if the amount paid him was a gratuity, it was a legitimate item of expense resting in the discretion of the Board of Directors to make, and not subject to review by a court, except upon the ground that any allowance was unjustified. It appears from the evidence in the case that the complainant has no pension system, and certainly the officers of the com-

pany have a right to take this into consideration in dealing with old employes who leave their service.

We quite agree with your conclusion that, treated as an expenditure applicable only to the year in which it was paid, the payment might make the expenses of that year abnormal, but only because payment was to an officer whose salary was presumably among the largest paid by the complainant. If spread over a period of four years, as the average method adopted by you would spread it, we believe it is a proper expense item which should be allowed. We can see no basis for your conclusion that if allowed, it would have to be spread over the entire period of his employment.

Adjustments Made in the Accounts of 1913.

(Report, pages 229-231½, inclusive.)

Assuming that you are correct in your conclusion that the expenses of the year 1913 do not represent the expenses of a normal year, complainant thinks your deductions are too great. The theory upon which these deductions are made you clearly state, viz: that there were expenditures in the year 1913 made to take care of the deferred maintenance of previous years. Assuming this to be true, when you deduct all of the expenses of 1913 for superintendence, ballast, roadway and track, and bridges, trestles and culverts, beyond the average of the three preceding years, the effect must necessarily be to leave the expense accounts of the year 1913 in the same condition as the three previous years,—that is, with too small an amount charged for maintenance. It would seem to us that even upon the theory on which these deductions are made from the expense account of 1913, they should have been only three-fourths as much.

Division of Michigan Passenger Operating Expenses Between Intrastate and Interstate.

(Page 277.)

Under this heading we desire to call attention to the method adopted by you for the division of the accounts, Station Employes, and Station Supplies and Expenses. It seems to us that a division on the relation of the tickets sold at stations would be more logical than the one adopted by you, viz: the relation of the number of passengers traveling inter- and intrastate, respectively, for the reason that the sale of tickets represents, as accurately as is possible, the actual relation of the passengers with station employes, and station supplies and expenses. It excludes from consideration passengers who pay on trains, and passengers from foreign lines who travel on through tickets, which two classes of passengers have little or no dealings with the stations or their employes. If the Master should conclude that the division should be made on the basis here suggested, the data therefor can be found in complainant's Exhibit 85.

Defendants' Objections.

Objection No. 1:

The right is reserved to present to the Court an exception that such report is erroneous in determining and finding, as a matter of law, that the complainant is not estopped, by the acceptance of land grant lands by itself or its predecessors in ownership, from questioning the validity of the Michigan passenger rate statute, fixing rates of fare to be charged upon complainant's railroad of two cents per mile for the carriage of passengers.

Objection No. 2:

Such report is erroneous in its conclusion and finding, as a matter of law, upon the question of the degree or positiveness of proof required, of those contesting a statutory rate of fare, to establish the invalidity of such rate, and in not finding that it is essential that every material question and conclusion, upon which the invalidity of a statutory rate is predicated, be established beyond controversy and beyond the possibility of a reasonable doubt, as well as in numerous instances throughout the report failing to apply the rule that every question throughout the controversy of sufficient materiality and importance, taken separately or cumulatively, as to affect the result, must be resolved in favor of the validity of the rate-fixing statute.

The applicable principle has been enunciated in many cases. It is, that every presumption is to be resolved in favor of the validity of legislative enactments; and rate-fixing statutes form no exception. The effect of this salutary rule has never been permitted to be frittered away by nice distinctions or refinements of reasoning, as is here attempted.

No discretion is vested in the courts in determining whether the Legislature, as a co-ordinate branch of the Government, has exceeded its authority. When positive proof of the exercise of excess authority is produced, then, and then only, can the courts perform their duty of declaring statutes to be unconstitutional. Before that duty arises, or will be performed, it must appear beyond possibility of reasonable doubt that the statute is unconstitutional, and, in order that it may so appear, it must also appear that *every link in the chain of evidence* to show such invalidity is established beyond doubt.

Such invalidity is not permitted to rest upon equivocation or opinion, and where there is doubt on any question or element, that doubt must be resolved to sustain the legislative action. We feel that in a number of instances throughout the case the doubt has not been resolved by the Master in favor of the validity of the statute, but has been resolved in favor of the complainant. A few of the particulars which may be pointed out are the following:

In allowances for the items "Contingencies," "Taxes," "Appreciation," "Working Capital" and "Stores and Supplies."

In refusing to depreciate ballast and track laying and surfacing.

In acceptance of complainant's alterations of defendants' modified revenue train-mile ratio for division of common property and common expenses.

In the determination that decreased rates will not, and did not subsequent to 1907, produce increased traffic.

The character, extent or effect of the presumption of validity does not depend upon proof or inference of the legislative knowledge, or its means of knowledge, or the extent of its investigation; it is a positive presumption that the law is valid unless all conditions which would render it invalid appear absolutely.

In *Chesapeake & Potomac Tel. Co. vs. Manning* (185 U. S. 245), it was said:

> "But it is well settled that the courts always presume that the legislature acts advisedly and with full knowledge of the situation. Such knowledge can be acquired in other ways than by the formal investigation of a committee, and courts cannot inquire how the legislature obtained its knowledge. They must accept its action as that of a body having full

power to act, and only acting when it has acquired sufficient information to justify its action."

In *Calder vs. Michigan* (218 U. S. 598), it was said:

"* * * we do not inquire into the knowledge, negligence, methods or motives of the legislature * * *."

In *United States vs. Des Moines Navigation & Railway* (142 U. S. 544-45), it was said:

"The knowledge and good faith of a legislature are not open to question. It is conclusively presumed that a Legislature acts with full knowledge, and in good faith. It is true the bill alleges that its passage was induced by the navigation company, by false representations and threats of suits; but such an allegation amounts to nothing. In Cooley's Constitutional Limitations (5th ed. 222), the author, citing several cases, observes: 'From what examination has been given to this subject, it appears that whether a statute is constitutional or not is always a question of power; that is, a question whether the legislature in the particular case, in respect to the subject matter of the act, the manner in which its object is to be accomplished and the mode of enacting it, has kept within the constitutional limits and observed the constitutional conditions. In any case in which this question is answered in the affirmative, the courts are not at liberty to inquire into the proper exercise of the power. They must assume that legislative discretion has been properly exercised. If evidence was required, it must be supposed that it was before the legislature when the act was passed; and if any special finding was required to warrant the passage of the special act, it would seem that the passage of the act itself might be held to be

equivalent to such finding. And, although it has sometimes been urged at the bar that the courts ought to inquire into the motives of the legislature where fraud and corruption were alleged, and annul their action if the allegations were established, the argument has in no case been acceded to by the judiciary, and they have never allowed the inquiry to be entered upon."

In *San Diego Land & Town Co. vs. National City* (174 U. S. 754), it was said:

"But it should also be remembered that the judiciary ought not to interfere with the collection of rates established under legislative sanction, unless they are so plainly and palpably unreasonable as to make their enforcement equivalent to the taking of property for public use without such compensation as under all the circumstances is just, both to the owner and to the public; that is, judicial interference should never occur unless the case presents, clearly and beyond all doubt, such a flagrant attack upon the rights of property under the guise of regulations, as to compel the Court to say that the rates prescribed will necessarily have the effect to deny just compensation for private property taken for the public use."

Louisville vs. Cumberland Tel. & Tel. Co., 225 U. S. 430-36.

Knoxville Water Co. vs. Knoxville, 212 U. S. 16-17.

Willcox vs. Consolidated Gas Co., 212 U. S. 19, 41, 54.

Louisiana Ry. Com. vs. Tel. & Tel. Co., 212 U. S. 414, 423, 425-28.

The argument by which the Master seeks to predicate his ruling on this point, upon things inferentially determined or not determined by the Legislature, is contrary to the above cases, as, in fixing the two-cent rate, the Legislature of necessity conclusively passed upon and determined every question essential to be considered. While its determination is not final, it is accompanied with

every presumption of validity, until an affirmative showing which excludes every possibility of doubt indicates it to be otherwise.

In order to sustain the legislation, the courts will even go so far as to speculate upon the existence of things which will operate to sustain its validity, and, where there is a possibility of certain conditions existing which will make a statute valid, they will assume those conditions to exist, and that the Legislature predicated its action thereon.

Missouri, Kansas and Texas vs. May, 194, U. S. 269.

In the inception of rate legislation, and for a number of years, the Federal Supreme Court regarded the legislative determination of the sufficiency of a rate to be final. This rule was reluctantly abandoned so as to permit of review by the courts where there was no return. Subsequently the courts assumed authority to determine whether the return was adequate, but, throughout the history of rate legislation, the Supreme Court has adhered to the principle that no rate should be set aside until clearly proven insufficient, and that all doubts must be resolved in favor of validity.

Objection No. 3:

Such report is erroneous in its findings and conclusion, as a matter of law, that the cost-of-reproduction value less depreciation, or the "replacement-cost value," is to be taken as the absolute measure of the value which must be sustained by the rates permitted to be charged.

Not only the leading case of *Smyth vs. Ames* (169 U. S. 546-47), but practically every rate case, to the present, recognizes that no single element or rule of valuation is

to be applied in determining the value of the property which must be supported by rates, and that all that the company is entitled to ask is a fair return on that which its employs for the public convenience. Value is not determined by replacement cost, though that may be a consideration in determining what is fair to the public and the utility, in the light of the rule that the interests of both must be considered.

Objection No. 4:

Such report is erroneous in its findings and conclusion, as a matter of law, that the cost-of-reproduction value upon which the complainant is entitled to a return can exceed, or does exceed the commercial value of the property, or the value or price at which the public could acquire full title to such property under the exercise of the right of eminent domain.

The utility is entitled to a return upon the value of that which it employs for the public. That value cannot be influenced down by the regulated rates being tested, nor up by the previous rates charged by the utility. Where, however, commercial value is indicated under rates which the utility has accepted, it cannot by reason of a high replacement cost claim a return, when testing the sufficiency of particular rates, upon an amount greater than the commercial value under rates *accepted* by it. The commercial value under the rates which the company *accepted* was admitted, and claimed by the complainant in its reports for taxation, to be not greater than $11,144,946 in 1913, and no so-called replacement cost, built up on the assumption of reproduction, can entitle complainant to a return from its passenger business on more than a proper proportion of its admitted commercial value.

As has been before pointed out, the property might be acquired for public use, by proceedings *in invitum*, at

its commercial value, and, if complainant is secured a return upon the passenger proportion of that value by the two-cent rate, it has no legal cause for complaint.

Objection No. 5:

Such report is erroneous in its conclusions and findings of law and fact, in that the value of the complainant's property in Michigan, as adopted by the Master, is excessive and is greater than its actual value, and is greater than the value thereof that the complainant is entitled to have supported by the statutory rates of charge. Such excessive and erroneous value is due to the following considerations:

(a) In arriving at, and in fixing, such values for real estate and right of way, the Master has included improper values, and improper elements of value, as follows, to-wit:

(1) The strategic or special value attributed to certain lands on account of their claimed adaptation for railroad purposes.

(2) The riparian or other water rights which are claimed to be appurtenant to the lands of the complainant at St. Ignace, Marquette and Houghton, so far as such riparian and water rights are not in actual railroad use.

(3) The trackage rights existing in streets in the cities of Marquette and Ishpeming.

(4) Mineral and ore values in and under the right of way, and speculative values due to the possibility of discovery of minerals under the right of way.

(5) Land values, generally, which are excessive and contrary to the weight of evidence.

(6) The reliance upon testimony of witnesses

placing high values, and refusal to take the testimony of witnesses entitled to credit and equally well qualified to fix values, whose values were well considered, and who fixed lower values, and the refusal to apply proven tests of the correctness or incorrectness of opinion evidence of value, which tests show the values taken and used by the Master to be too high.

(7) The refusal to take into account, or be influenced by, values as fixed by actual purchase and sale of similar nearby and adjacent lands.

(8) The addition of values for clearing and grubbing, which brings the values of the complainant's lands above the values of similar cleared lands nearby and adjacent.

(b) In arriving at and fixing such values for real estate and right of way, the Master has proceeded upon erroneous and improper methods of valuation, in that:

(1) Lands in considerable or large tracts are considered and valued upon the basis of adjacent or nearby lands subdivided into small lots, and upon the basis of an immediate sale of the whole of such lands at the values or prices which were paid for a small number of lots out of a large number in the vicinity.

(2) The assumption is given effect, that there would be an immediate demand, at high prices, for all of the South Shore lands now occupied by the railroad.

(3) The detrimental effect of the railroad, as giving a lower value to lands in its immediate vicinity for other than railroad purposes, was not taken into account, in that the railroad lands were considered of the same value as, and compared with, residence and high-class business property located in the better parts of municipalities where those lands lay.

(4) Principal and important streets in municipalities were assumed to be projected through and on to the land of the complainant, and the further assumption was placed that there would be an immediate demand for all the railroad lands thus assumed to be on such streets, for the same uses as the occupied lands now on such streets or in the vicinity.

(5) Values which are based upon purchases for railway purposes are accepted, resulting in the inclusion of the values and elements of value for railway purposes forbidden under the *Minnesota Rate Cases.*

(c) In valuing the property of the complainant, the Master placed thereon high and excessive values, in this, that:

(1) He found the total value of the lands of the complainant in Michigan to be $1,780,239, whereas the true value, and the value proper for use in a rate case, was, and is, much less, excessive values being placed upon the lands in each of the counties of Chippewa, Mackinaw, Schoolcraft, Marquette, Baraga, Houghton, Ontonagon and Gogebic.

(2) He valued the trackage rights in streets (erroneously included) at much in excess of the cost to produce, or to reproduce, and in excess of any value therein belonging to the complainant.

(3) He assumed that to reproduce the earth grading upon the complainant's line and right of way would cost thirty cents per cubic yard, whereas the true cost to reproduce, and the real production value, is much less, and does not exceed an average of twenty-five cents per yard.

The price adopted for grading is higher than prices paid by the South Shore on its line in recent years, and

higher than that shown by the majority of bids on 25 miles to be constructed for the Chicago, Milwaukee and St. Paul in the vicinity.

---

(4) He finds a unit price for ties of forty cents each, notwithstanding the records and reports of the complainant to public boards in Michigan show tie prices to be considerably less, and notwithstanding the actual purchase price and value of ties is less than forty cents each.

Riggs first used a tie price of 34.77 cents per tie. When Hansel erroneously used forty cents per tie, Riggs increased his estimate to forty cents. That price involved a duplication of the cost of transportation, inspection and loading, as the average of tie prices reported to the State for five years (1909-1913), and used by Riggs as his base price, included those items and was 31.39 cents.

Riggs' price, as figured by himself, after adding for, and thus duplicating charges for, transportation, inspection and loading, was less than forty cents; this he increased to forty cents on the assumption that, assuming reproduction, the demand for ties in the community would so increase as to raise the price to forty cents.

His use of a simple average was also improper, as giving undue weight to the lesser number of high-priced ties purchased.

---

(5) He incorrectly applies the unit prices and depreciation percentages which he adopts for rail to the rail existing in complainant's line, with the result that he erroneously fixes a value for this item

of $1,193,882., instead of $1,170,995., which is the result of correct application of the prices for rail and of the method of determining depreciation which he adopts.

(6) Notwithstanding that the weight of the evidence shows that ballast depreciates and that it must be renewed and replaced from time to time, to keep it in 100 per cent condition, he refuses to allow for the depreciation of that item, and finds and determines that there is no depreciation in it.

All the witnesses who testified upon the subject of depreciation of ballast—seven in number—admitted or testified that ballast does in fact depreciate and must be renewed (Defendants' printed Brief, p. 44). That ballast deteriorates cannot be gainsaid; that this deterioration is depreciation in value is the self-evident result of the fact that expenditures must be made to restore the condition to 100 per cent.

No argument can change the admitted fact that when ballast is newly placed it is in 100 per cent condition, and that thereafter it deteriorates as ballast, and the time comes when expenditures must be made to restore it to 100 per cent condition. Whether the falling off of value or serviceability is called depreciation or not, a deduction from value, to represent present condition, must be made, or the appraisal does not accord with the facts.

---

(7) He adopts as the price and value, or cost of reproduction, of the item "Tracklaying and Surfacing," $600 per mile, whereas the real value, or cost of reproduction, of that item is not shown to be in excess of $526 per mile on complainant's railroad.

(8) He does not depreciate the item "Track Laying and Surfacing," although the same does depreciate and exists in the complainant's railroad in a depreciated condition, and although the track structure, made up of ties, rails, frog switches and crossings, track fastenings, and track laying and surfacing, as a whole does depreciate, and the track laying and surfacing does depreciate in like proportion as do the other items of the track structure.

"Track Laying and Surfacing" is not a separate article or item of property. It is the labor portion of the track structure, above the grade. This track structure is made up of ballast, rails, track fastenings, frog switches and crossings, ties, and track laying and surfacing, united, in the same way a bridge is made up of the timber, ties, iron and steel, and labor which unites in forming the bridge.

The mere fact that the item "Track Laying and Surfacing" is separated in inventory, for the purpose of applying a unit price, does not so separate it from the track structure of which it forms a part as to relieve it from the depreciation which occurs in the track structure.

To the same extent that any item of property depreciates, so the labor which created it depreciates, and the rule here sought to be applied, by separating the labor from the material, is an exception to all human experience. Track laying and surfacing exists only as a part of the structure created, and as the structure created disappears or depreciates, so must the track laying and surfacing, which is only found in the assembly of items of the track structure, depreciate or disappear with the property in which it is found. It is, and must be, admit-

ted that the making good of depreciation in ballast, rails, ties, etc., requires also a renewal of the labor entering into the original laying and surfacing of the line.

The warning which the Master urges upon counsel, in the third paragraph on page 163 of his report, regarding "Contingencies," may well be taken into account when considering this account, as it is evident that depreciation on this item is denied solely because of its being treated, for purposes of convenience, as a separate item of appraisal.

---

(9) In the item "Sidetracks" he neglects to deduct the turnouts which are already included, in whole or in part, in the valuation of the through main track, thus causing a duplication of property included in the appraisal, which said item of turnouts the witness, Riggs, for complainant, testified should be deducted, in the number of 1,630, at $18 per turnout in 60 per cent condition.

(10) In reference to the item "Engineering on Roadway and Structures," the Master states that he deducts $20,000 as fixed by Hansel for cost of acquiring land, whereas his computation, as finally completed, still carries the Hansel total of $255,000.

(11) In arriving at the value of the item "Locomotives," and the proportion thereof to be attributed to the passenger business in Michigan, the Master erroneously divides the portion thereof attributed to the non-revenue mileage between passenger and freight on the basis of 46.98 per cent passenger, whereas such non-revenue locomotive mileage is made in serving the property and should be divided upon the basis in which the property is allocated and assigned to the different services, or on the ratio

of the "Maintenance of Way and Structures" expenses in the different services, namely, not greater than 30.7 per cent to passenger.

Locomotive No. 43 is included in the valuation, although not in use since 1911, when it made but 135 miles in freight service, and the entire value thereof is attributed to the passenger business, whereas, due to the fact that its last operations were in the freight service, it should be entirely attributed to the freight service.

(12) In the item "Passenger-train Cars," the Master erroneously attributes to the Michigan Passenger business too large a proportion of the value, by using a basis of apportionment which assumes a certain train consist and apportions the value of the cars in such train upon the basis of their mileage in each state, which method of apportionment assigns to Michigan all reserve cars, and does not assign to Wisconsin cars which are extra to the assumed train consists, or which are used in special or excursion trains, or substitute cars which are used in case of failure of any car regularly in service in Wisconsin. Such apportionment is erroneous, in not dividing such passenger-train cars (excluding official cars, sleepers and diners) on the basis of car-mileage of D., S. S. & A. passenger-train cars in the respective states. Of the value of the sleepers and diners, an insufficient proportion was assigned to Wisconsin and too great a proportion to Michigan.

(13) Said value is improperly increased and enlarged by the allowance of a constructive percentage of two per cent as "Engineering on Equipment."

The larger part of the present equipment was added during operation. There is no shown cost or expense for engineering thereon. If there was any such cost, it has been charged in operating expenses, and, under *Louisiana Railroad Commission vs. Cumberland Telephone Co.* (212 U. S. 423-25), it cannot be included in the value to be supported by rates.

---

(14) He adds, on account of the item "Contingencies," the sum of $400,000, without sufficient proof that contingencies in that amount, or in any amount, exist in the value of the property or would inevitably occur in a reconstruction, or were incurred and paid for in the construction of the property.

Contingencies may occur which will vary the estimated cost, up or down. Whether the variation will be up or down is uncertain and depends on the accuracy of the estimate. In the present case there is no room for uncertainty which requires additions of estimated amounts to cover a cost which may or may not occur. Rate-fixing statutes are not declared invalid upon probabilities of value, but upon proven existing values only. In the very nature of the item, which is at best but a probability of value, is found the reason for its exclusion from value in testing the validity of a rate-fixing statute, where it is predicated upon a complete and careful inventory. The language of the Court in the *Ann Arbor Rate Case* upon this item is, in general, equally applicable in this case. That language follows:

"* * * But the evidence in the present case furnishes no warrant or justification for an allowance for contingencies. Contingencies are said to be

of two kinds: those of inventory and those of construction. In these days of highly systematized work there is little chance of omissions in inventory and, while in theory this railroad is to be reconstructed, in fact it is already built and in operation and there can be no unknown contingencies of construction. Moreover, costs of construction which make up plaintiff's valuations have been fixed at top prices charged by contractors and builders who assume all the risks of contingent losses. Ties are valued from ten to twenty-five per cent higher than the actual cost to this company. The cost of grading and track laying is figured upon the basis of contract prices from ten to thirty per cent greater than those prevailing even in these days of high prices. In fact, each item or class of property has been valued sufficiently high to include a safe and sufficient margin for contingencies and no sound reason exists for the allowance of an additional lump sum to cover improbable losses."

---

(15) He allowed and included in the value of complainant's property, on account of the item "Legal Expenses during Construction," the sum of $51,400, whereas the weight of evidence indicates that the allowance therefor should not exceed $25,000.

It seems apparent that less would be spent for legal expenses during the period of construction than during a similar period of operation. Riggs so testified. Computed upon that basis, the allowance for legal expenses would be less than $25,000.

(16) The amount allowed by the Master as "Interest during Construction" is more than any proportion of the value of complainant's road attributable thereto, is greater than any amount shown to have been expended on account thereof by complainant out of capital, and is greater than any amount which would be expended in case of reproduction.

Interest during construction is computed upon items shown in Exhibit 1 (p. 2) to be included in the inventory at actual cost.

(17) The allowance by the Master of $100,000, on account of the item "Taxes during Construction," is improper, as there is no proof that taxes would be paid, or of the amount that would be paid, in case of reconstruction, or what was actually paid during construction, because, during the period of construction of complainant's railroad, taxes were imposed upon gross earnings of railroads, while the property was exempted.

Complainant claimed nothing for taxes during construction. The only witness testifying with regard thereto was Hansel, who allowed $50,000 on property other than real estate.

The allowance of any amount is purely speculative, as there is no shown practice to tax uncompleted railroads in Michigan, nor showing of what would be the basis of the assessment.

---

(18) Allowances and additions by the Master, on account of the items "Working Capital" and "Stores and Supplies," are excessive, in that the amount allowed for stores and supplies is amply sufficient for both of such items.

(19) The amounts allowed for depreciation upon various of the elements or items of the property are insufficient.

(20) The amount of $300,000 added to the appraisal on account of "Appreciation" is not sustained by the evidence. The existence of any appreciation in the roadbed of the complainant which would increase its condition above 100 per cent of the roadbed, as inventoried and included in the appraisal, is not proven, and there is no proof from which it is possible to draw a conclusion or to make a finding to the effect that appreciation to the extent of $300,000, or any other amount, exists in the complainant's railroad.

A value for appreciation, if properly allowable and to be added, is improperly proportioned between services, as, if it exists, it would attach to the property in the proportions in which the roadbed under *all* tracks is assigned to the respective services.

There was, and would be, no cost to the complainant for this item, other than the amount which was, and would be, included in, and paid for out of, operating expenses.

Nothing was included in any inventory for appreciation. No notice or intimation was given of a purpose to claim or add for it, until the argument. The only sustaining testimony is that given to justify carrying grading undepreciated, at 100 per cent. The sole testimony upon which even a speculation as to its value might be made (occurring on Record pp. 249-50), was adduced for distinctly another purpose. Of almost identical testimony, given by the same and other witnesses in the *Ann Arbor Rate Case* with the declared purpose of making an addition for appreciation, the Court said:

"Counsel for plaintiff also insist and the evidence indicates that the roadbed of a railroad appreciates in value, at least during the first few years after construction. The grade becomes more compact and solid with age and use and the slopes of the grade and the ditches become covered with vegetation which tends to prevent erosion. However, no allowance is made for such appreciation in any of plaintiff's schedules or computations and there is no evidence from which the value of such appreciation can be determined with any degree of certainty. It is true that one witness testified that a larger number of section men are required to keep in condition a new railroad than an old one. This may be owing to the fact that a new railroad is seldom in a normally perfect condition of completion at the beginning of its operation. At any rate, this testimony does not furnish a sound basis for the allowance of additional values."

The argument we presented on this question (Defendants' typewritten Brief, pp. 136-46) was conclusive against its allowance. The testimony of greater cost during the first few years, upon which the Master bases his finding of its value, is not upon, but beside, the question, as the requirement of extra section men was expressly stated to be:

" • • • to take care of the work of cleaning out of cuts and of replacing earth around embankments that had sunk down or been washed away."

The extra work, and the charge therefor, was, under this statement, to keep the grade in 100 per cent condition. To cover these expenditures, Riggs had added 17.5 per cent to grading.

Objection No. 6:

Such report is erroneous, in that it finds the value of the property of the complainant attributed to, and which is required to be supported by, the Michigan passenger business, to exist in too great an amount and value, due to the fact that he makes no deduction therefrom for property created or paid for out of operating expenses; that the amounts of property created out of operating expenses are indicated by the testimony to be large, and that it was incumbent upon the complainant to show the amounts thereof, in order that they might be deducted from the value to be sustained by rates, and, in the absence of such proof, no finding of a value of complainant's property which should be supported by rates was, or is, possible.

Objection No. 7:

Said report is erroneous in finding and setting off to exclusive freight trackage, as the expenses attributable thereto, an insufficient amount, in that:

(a) Nothing is set off to the exclusive freight main line trackage of 13.06 miles.
